The Latin American connections, Gordon suggested, imbued University of Chicago-based monetary economists acquired greater familiarity with the region's data and with postwar historical episodes of severe inflation situations. As indicated above, by the mid-1950s it was already possible to ascertain that these countries' outcomes indicated that triple-digit rates of monetary expansion were manifested in very rapid inflation but not in above-normal growth in output. It would also become clear on the basis of the region's experience that high-inflation periods could be associated with severe impairments of real growth. Bergoeing, P. Kehoe, T. Kehoe, and Soto (2002, p. 173) would later summarize the record as indicating that "in most Latin American countries, high inflation is often associated with large drops in output, not with substantial recoveries." This pattern was already becoming evident already in data for the 1950s and 1960s: even Paul Samuelson (*Newsweek*, February 25, 1971) acknowledged that the "cantering inflations" of Chile and Brazil had been associated with poor outcomes for real variables.
The different data pattern in Latin America, Gordon suggests, may have spurred the empirical

[133] In Russ Roberts (2006).
[134] Friedman (1987a, p. 13).
[135] For more recent discussions of this point, see Gordon's (2011, p. 16) further remarks, as well as Boianovsky (2020).

acceptance in the money workshop of analytical frameworks that made the price level endogenous and ensured long-run links between monetary growth, nominal interest rates, and inflation. In this way, the Latin American data contributed to the divergence in thinking between the University of Chicago and other major bases of U.S. research on aggregate economic behavior (Robert Gordon, interview, March 21, 2013). This disposition toward the natural rate hypothesis and related propositions contrasted, as Gordon (1976a, p. 54) observed, with the "forced acceptance" of the hypothesis among many other U.S.-based economists in response to the accrual over the early 1970s of incoming U.S. data on inflation and on real variables.

Gordon suggested that this background accelerated Friedman's own development of the natural rate hypothesis and made other workshop members receptive to the hypothesis. It also, he felt, was what helped make them skeptical about the notion that "monetary expansion would drive down interest rates" and subscribers to the idea that, over a period of years, empirical data were described by "the long-term model in which prices are completely flexible… so a monetary [expansion]… would cause ultimately just a change in the price level." Exposure to the Latin American data, in conjunction with the light it threw on the appropriate analytical framework, "was, I think, the key reason for the distinction between what they [at the University of Chicago] thought and what they [at other major U.S. universities] believed." (Robert Gordon, interview, March 21, 2013.)[136]

Friedman's invocation of the Latin American experience, including Chile's, was a recurring feature of his discussions of inflation and of monetary relationships in the 1960s and 1970s. Although Schliesser (2010) takes references to Chile's inflation experience in Friedman's December 1976 Nobel lecture as indicating his preoccupation with the recent controversy over his own connection with that country, this interpretation may well rest on the fact that Schliesser considers very little of Friedman's body of statements. For a notable feature of Schliesser's paper is that its confident declarations about Friedman's thinking are accompanied by very sparse citation of Friedman's work. Even Friedman's Nobel lecture and his 1982 *Newsweek* column on Chile are not referenced in their original form in Schliesser's paper, which instead relies on excerpted or reprinted versions when quoting from these articles.

---

[136] Robert Lucas—who was not a member of the money workshop in his years through 1963 as an on-campus student at the University of Chicago—was initially surprised at the seeming failure of plots of Latin American data on inflation and real series to conform to an unaugmented Phillips curve (see Lucas, 1981a, p. 12). Of course, by the late 1960s he had become a strong proponent of the natural rate hypothesis himself—and, in Lucas (1973), he interpreted Latin American countries' output and inflation data as supportive of the hypothesis.

In contrast to any notion that citations of Latin American experience were newly prevalent in Friedman's discussions as of 1976, the fact is that they had appeared frequently, and prominently, in his prior statements. For one thing, as Boianovsky (2020) stresses, Friedman citations of Latin American experience were common to his 1967 American Economic Association presidential address, well before the Chile controversy, and his Nobel lecture. It is also the case, as the quotations in the first section of this chapter indicated, that Friedman also talked about the inflation/threat-to-democracy connection, raised in the Nobel lecture, before his trip to Chile, let alone before the post-Chile-trip public controversy.

In the 1967 presidential address, as in numerous other forums in surrounding years, Friedman would particularly cite Latin American countries for the evidence they supported regarding the Fisher relationship. "Studies for countries like Argentina and Brazil and Chile, countries that have had very substantial inflation, show the same phenomenon," he remarked at a 1968 banking conference held in the city of Chicago. He stressed that these nations provided strong confirmation of the interest-rate/inflation link, much more so than did the United States at that time.[137] In the same presentation, he had linked the matter to rates of monetary growth: "If I ask in what countries in the world are interest rates high, there will be widespread agreement that they are high in Brazil, Argentina, and Chile. If I [then] say, 'I take it that in those countries there are very low rates of increase in the quantity of money and that interest rates are high because money has been tight,' you will laugh at me. Those are countries which have had very rapid increase in the quantity of money and inflation."[138] Friedman gave a similar formulation in the London *Sunday Times* of September 20, 1970, again naming these three countries. Similarly, a little further into the 1970s, in Instructional Dynamics Economics Cassette Tape 75 (June 2, 1971), Friedman observed that the "much wider range of [data variation in] countries in South America… indeed fits in with what I was saying earlier about the short-run and longer-run effect of changes in the quantity of money. If you look at countries like Mexico, Brazil, Argentina, Chile, and so on, you will find that wherever you have a high degree of inflation, you have high interest rates."

When it came to the details of these countries' experiences, Friedman was relying on others' work. For example, he noted: "I am not an expert on Mexico, and I do not know anything in detail about the Mexican experience." (Instructional Dynamics Economics Cassette Tape 75, June 2, 1971.) But through his colleagues, and in part via the work of students who had been

[138] Friedman (1968e, pp. 12–13).

part of Friedman's workshop, the University of Chicago's Department of Economics became known for its studies of inflation situations in Latin America. Some of this work bore on another front of battle in the contest between monetarists and nonmonetarists: the fight between monetary vs. nonmonetary (or, in its Latin American variant, "structuralist"—see, for example, Mikesell, 1967) explanations of inflation. One of the University of Chicago economics department members active in this area, Larry Sjaastad, would remark in April 1975: "It took us fifteen years to stamp out the doctrine of structural inflation in Latin America."[139] Being a type of cost-push view of inflation, the structuralist position pointed to the desirability of direct government intervention in the price-setting process. Consequently, Friedman recalled structuralist policies in the 1950s and 1960s as being packages of measures that interfered with the operation of the market.[140]

Friedman's commentary on Chile during the Allende tenure (*1970 to 1973*)

Following his election victory in September, Salvador Allende ascended to the presidency of Chile on November 3, 1970. In his regular media commentaries and various additional op-eds during the 1970–1973 Allende tenure, Friedman's remarks on the policies of Chile's government were quite limited. One of its actions to which he did make reference on more than one occasion was the takeover of copper mines that had hitherto been under U.S. corporate ownership. Friedman criticized the carrying-out of the nationalization—the fact that the government's acquisition took place at below-market prices (*Newsweek,* August 16, 1971; *New York Times*, October 29, 1971).

This was a feature that marked the move out from some other nationalizations around the world, of both domestically-owned and foreign-owned firms or industries. Friedman was, of course, frequently, and outspokenly, skeptical regarding the economic merit of nationalizations. But the cases in which nationalization did not involve market-consistent compensation of the previous owners was, in his view, a breed apart—being deserving of special criticism, as it amounted to clear-cut public-sector confiscation of resources. A decade earlier, he had criticized the nationalization of real estate and firms' capital stock in Castro's Cuba. Friedman recalled these Castro nationalizations in the same August 1971 *Newsweek* passage that contained his criticism

[139] In Birnbaum and Laffer (1976, p. 184).
[140] Friedman (1981a, p. 7).

of the 1971 Allende copper nationalization.[141]

This distinction between different ways of proceeding with nationalization was, in fact, widely made. In particular, the fact that the nationalization of the 1956 Suez Canal Company by the Nasser-led government of Egypt took place at market prices was a feature of the move that was regarded as preventing the U.K. government from making a viable legal case against this takeover of what had previously been, to a large degree, a U.K.-owned firm (Love, 1969, p. 365; *Daily Telegraph* (London), June 10, 1995; Thorpe, 2005, p. 478).

Paul Samuelson similarly highlighted the Allende nationalization moves as breaking with commercial norms and as raising the specter of further expropriation of American companies' funds invested abroad. "We have only to look at Chile and other countries to realize that we should always keep our fingers crossed—and that there is an element of contingency in our ownership abroad," he remarked during Allende's first year in office (Instructional Dynamics Economics Cassette (Paul Samuelson series) Tape 81, July 26, 1971).[142] Samuelson later added (Instructional Dynamics Economics Cassette (Paul Samuelson series) Tape 103, June 5, 1972): "Can one really believe that in the last three decades of the twentieth century, the rest of the world can be confidently counted on to permit the continuing flow of dividends, repatriation of earnings and royalties to large corporations [that are] owned here? I don't think I am paranoid to raise a doubt in this matter. Think of Chile, think of Cuba."

The nationalization steps that both Friedman and Samuelson discussed were part of an overall radical economic program of the overtly socialist Allende Chile government. On account of

---

[141] See Friedman (1961a, p. 73) and *Newsweek*, August 16, 1971. Both these 1961 and 1971 discussions were actually made primarily in the context of criticizing historical *U.S.* government policy. In both pieces, Friedman noted that the U.S. government's requirement in the mid-1930s to have citizens turn in their gold holdings was analogous to the Castro or Castro-Allende procedure of implementing nationalization through forced sales to the government at below-market prices. In particular, in August 1971 Friedman argued that, on account of the 1933 U.S. precedent that the U.S. government did "not have a leg to stand on" in objecting to the cases of foreign expropriation like the recent nationalization in Chile. His position was, of course, not that expropriation was appropriate or excusable but that there were (also) examples of U.S. government measures that were tantamount to this practice. His manner of putting the matter in these terms was not likely to have been particularly amenable to the Nixon Administration, which during 1971 was making vigorous public and private objections to the details of the Chile copper nationalization. Notably, on behalf of the administration Admiral Elmo Zumwalt made the case directly to Allende, in a February 1971 meeting with Chile's president, that, while the U.S. government accepted Chile's prerogative to nationalize U.S.-owned firms, it maintained that such moves, when carried out, should involve adequate compensation of the private enterprises affected. See McElveen and Siekmeier (2014, p. 571).
[142] These words were spoken not long after the Chilean government's copper nationalization had become effective (on July 16, 1971), ahead of a Chilean-government-time-limited period of negotiation on compensation. See McElveen and Siekmeyer (2014, p. 656).

Allende's own Marxist outlook and various specific steps and postures taken by his administration, including its attitudes toward U.S. businesses, his government's policies were regarded by observers as part of the overall ongoing contest between the United States and the USSR.

Both sides of the geopolitical contest saw Chile in such terms. Garthoff (1994, p. 541) remarked: "The Soviet leaders… staked much hope [on] Salvador Allende's Chile." Similarly, Gouré and Rothenberg (1975, p. 97) noted that "Moscow attributed particular importance to the… election of Allende to the presidency of Chile," and they quoted an August 1971 item in the USSR state media as having stated that Allende's election was "second only to the victory of the Cuban revolution in the magnitude of its significance as a revolutionary blow to the imperialist system in Latin America."

Whereas, to the Soviet authorities, Chile was seen as demonstrating the possibility of a democratic transition to a Communist state, in the United States it was a source of concern as a possible spearhead for revolutionary governments in Latin America. Within the U.S. government, the likelihood that Allende would move domestic arrangements toward those associated with collectivist socialism was foreshadowed, with a CIA report of July 30, 1970, stating: "An Allende administration would proceed as rapidly towards establishment of a Marxist-Socialist state as the circumstances permitted."[143] This analysis also emphasized possible geopolitical repercussions: "Allende… would almost certainly take harsh measures against U.S. business interests in Chile and challenge U.S. policies in the hemisphere. The hostility of Allende and his allies towards the U.S. is too deeply rooted to be easily changed. On key international issues, which involved any kind of an East-West confrontation, an Allende administration would be openly hostile to U.S. interests or at best neutral."[144]

As these comments implied, the global contest with the Soviet Union helped motivate the steps that the Nixon Administration took to stop Allende. Its attempts included covert efforts to influence Chile's election results; then attempts to stop Allende's swearing-in after his election victory; and, after Allende's swearing-in, actions intended to undermine the government and to support its replacement, including removal by undemocratic means.

[143] In McElveen and Siekmeier (2014, p. 125).
[144] In McElveen and Siekmeier (2014, p. 121).

The introductory text of the U.S. State Department volume that provided historical documents related to U.S. policy toward Chile over 1969–1973 noted that the period from 1970 to 1973 saw administration efforts during 1970 "to block Allende, either by constitutional means or by military coup" and that the Allende years saw the administration implement a "policy to destabilize the Chilean government while simultaneously strengthening ties with the Chilean military."[145] As part of this process, as Garthoff (1994, p. 357) observed, covert U.S. government action in Chile, which spanned the period from 1963 to 1973 and had included the financing of Allende's political opponents in the 1964 and 1970 Chilean elections, was stepped up from 1971 onward.

Various departments of the U.S. government were involved in the internal administration discussions of Chile, including the U.S. Treasury, whose head John Connally sent a memorandum to Nixon on August 10, 1971, expressing concern that Chile's practice of incomplete- compensation nationalizations of U.S.-owned firms might "become a blueprint" for other countries (McElveen and Siekmeier, 2014, p. 656), and who produced a further memorandum on January 15, 1972, in which Connally provided suggestions to the president regarding what measures would further the administration's aim to "keep maximum pressure on Chile" (McElveen and Siekmeier 2014, p. 757).

In the Department of Defense, as detailed by Kuehn (2019), during the first Nixon term G. Warren Nutter was one of those receptive toward the idea of a Chilean military coup to remove Allende—although, in the event, the actual Pinochet coup occurred in September 1973, after Nutter was out of government. Nutter was, of course, a one-time dissertation student of Friedman's. His job in the Nixon Administration lay, however, outside economics, and so he was—unlike George Shultz, for example—not one of the figures in the administration with whom Friedman was in close contact over the 1969–1973 period.

Friedman's decision to travel to post-coup Chile and anticipations of the controversy

Friedman's personal involvement regarding events in Chile came when he accepted an invitation from Harberger to accompany him on a trip to the country that took place in late March 1975.[146] Harberger himself would later publicly confirm that Friedman's going to Chile was "largely at my urging" (*Wall Street Journal*, December 12, 1976*a*).

[145] McElveen and Siekmeyer (2014, p. V).
[146] See Friedman and Friedman (1998, pp. 398–399).

The trip to Chile had been announced in that country's press in December 1974 (Farrant, 2020, p. 124). The fact of the forthcoming trip was therefore publicly known, and on the basis of the resulting reaction Friedman knew in advance of the trip that his going to the country would certainly be controversial. In mid-March 1975, he remarked publicly, albeit in the low-circulation outlet of his audio commentary series (Instructional Dynamics Economics Cassette Tape 166, March 1975): "I have a great problem with many friends of mine who always say: 'Well, now, how can you go to places like Brazil and Chile, when they are military dictatorships?' Well, going to 'em doesn't mean approving of their political system. But, on the other hand, given their political system, it is certainly desirable that it operate as best as possible in an economic sense. And, more important from our point of view, you ought to be willing to learn from all kinds of regimes, whether they be totalitarian or not. They have lessons to teach us. And, as scientific observers, I don't believe we ought to throw away the opportunity to get evidence on things we're interested in."[147]

This commentary articulated a number of the arguments that would feature in Friedman's many post-March 1975 defenses of his trip. The notion that going to a country or being involved in improving its economic system did not connote "approving of their political system" would recur in Friedman's many remarks on Chile during 1975−1976, and in later years too. Another statement—"you ought to be willing to learn from all kinds of regimes"—reflected the same line of argument that he advanced in his February 1975 correspondence with academic Gerhard Tintner, who, due to the controversy over Chile, would turn from one of Friedman's longtime friends to a determined critic, and who wrote privately to Friedman to criticize his willingness to make the trip (see Farrant, 2020, pp. 112−118). Friedman's February 1975 statement to Tintner that "I shall be going entirely as an observer" (quoted in Farrant, 2020, p. 113) lined up with his March 1975 taped commentary above putting himself in the category of "scientific observers," as well as his remark in the summer of 1977 that his trip to Chile had been motivated by the fact that "as a scholar I wanted to see what an honest-to-God inflation was like" (*Reason* magazine, August 1977, p. 25) and his likening, in a discussion that he made earlier in 1977, of his trip to

[147] As was implied by these remarks and those (quoted in Chapter 4 above) that he made regarding Brazil, Friedman did not put great stock in using the "totalitarian" and "authoritarian" terms as a means of distinguishing between different types of dictatorships. Outside economics, some defense hardliners, including Brian Crozier (1978, pp. 200–201) and, most famously, Jeanne Kirkpatrick, did utilize these terms to distinguish between Communist and some military dictatorships and only called the former "totalitarian." In practice, however, Friedman did make a version of this distinction between authoritarian regimes and Communist regimes (an early example being his commentary in Instructional Dynamics Economics Cassette Tape 137, January 4, 1974, with later examples considered below), even though he was not strict in making terminological distinctions between them.

natural scientists' wish to go to countries that featured the natural phenomena that they studied (*Stanford Daily* (Stanford University), January 31, 1977, p. 1).

At cross-purposes with this observer status was his indication, already made ahead of the trip, that he wanted, as he put it in the March 1975 commentary quoted above, to help in the process of making the country "operate as best as possible in an economic sense" and that his dialogue in Chile would include articulation of his economic diagnoses and related policy recommendations. As part of this process, Friedman's trip would include meetings with members of the government. Indeed, in early 1981 he described communicating "the latest findings about [inflation's] cause and cure" as well as the case for a market-based economy as a reason his interlocutors wanted to speak to him in Chile, and he indicated that this was true both of his meetings with both government and non-government figures (*Newsweek*, January 12, 1981).

Although Friedman had clearly been forewarned to some extent of the controversy that would be associated with his trip to Chile, he likely believed that—as had basically occurred with respect to his 1973 visit to Brazil—he would be able to ride out initial criticism of his trip and obtain acceptance of the message that his trip, and discussion of the country's economic arrangements, did not connote an endorsement of the political regime.

Nevertheless, on account of the Pinochet regime being the subject of widespread condemnation and related news coverage, Friedman likely knew that the Chile trip would be more controversial than that he had made to Brazil. Although he did not anticipate the size of the backlash that would occur, in making the arrangements concerning the trip to Chile, he and Harberger took steps that Friedman evidently believed, erroneously as it turned out, would separate him in public perception from the Chile junta. First, the funding of the trip did not come from the government: Harberger would note that the trip was financed "under the auspices of a private Chilean foundation" (*Wall Street Journal*, December 10, 1976*a*), while Friedman variously described the trip as being made possible "under private auspices" (*California* magazine, October 1984, p. 78), "under the auspices of a private foundation" (*Newsweek*, January 12, 1981), "under the auspices of a private bank" (*Meet the Press*, NBC, October 24, 1976, p. 3 of transcript), "under the auspices of a private Chilean bank" (*Newsweek*, June 14, 1976*b*), "at the behest of a private foundation," and "under the auspices of the Banco Hipotecario."[148] These various descriptions

[148] The final two quotations are from Friedman (1977k, p. 491) and Friedman and Friedman (1998, p. 399), respectively.

were consistent with one another, as the foundation in question was one financed by the named Chilean bank or bank holding company (Edwards and Montes, 2020, p. 110).

A second step that Friedman took to try to forestall the trip being seen as an endorsement of the regime was to turn down the offer by two universities to give him honorary degrees during his trip (*Wall Street Journal*, December 10, 1976*a*). His grounds for rejection were that the universities received government funds: "I refused to accept the degrees, because I did not want to seem to be expressing approval of the political system in Chile."[149]

These steps at making the trip one not perceived as associating Friedman with the government would be to little avail, in view of the fact that he met junta members, including Pinochet, during the trip and the additional fact that the government was, in early 1975, contemplating economic proposals advanced by a number of the Chilean one-time University of Chicago economics students. Friedman was also traveling to Chile during a time when the U.S. government's covert operations in the country were being disclosed. Friedman's hope to avoid a major controversy in these circumstances, Paul Samuelson would suggest, demonstrated that "Milton is the most naïve fellow in the world" (*Sunday Times* (London), December 12, 1976).

Public appearances in Chile

"While in Chile, I gave a series of public lectures, some of which have been published," Friedman remarked in a 1977 defense of his trip. "I also talked to a variety of groups of people."[150] A detailed account of Friedman's public engagements and the content of his speeches is provided in Edwards and Montes (2020).[151]

In their accounts of their March 1975 time in Chile, both Friedman and Harberger would stress that Friedman's public lectures included the delivery at two universities of his lecture "The Fragility of Freedom," a version of which Friedman later also gave in the United States in a talk at Brigham University, Utah, in December 1975.[152] In his late-1976 defense of the trip and

[149] Friedman (1977k, p. 491).
[150] Friedman (1977k, p. 491).
[151] Importantly, their coverage includes press interviews. In addition, a collection, issued by the bank that had hosted him, of some of Friedman's public remarks was published in Chile in Spanish: see Friedman (1975k).
[152] Although Edwards and Montes (2020, p. 114) treat the Utah speech's contents as something that has to be inferred from other sources—such as variants of the speech that appeared in *Encounter* (Friedman, 1976c) and in Feldberg, Jowell, and Mulholland (1976)—the Utah speech itself actually appeared in print twice in the United

Friedman's participation in it, Harberger stressed that the Friedman lecture "characterized the present government of Chile as one which was denying and curtailing freedom in many important ways, and expressed the hope that in the near future Chileans would once again enjoy a full measure of political and intellectual liberty." (*Wall Street Journal*, December 12, 1976*a*.) Harberger's discussion also indicated that Friedman met privately with opponents of the junta during his trip—a point that Friedman's own accounts also brought up on a number of occasions.[153]

Friedman's meeting with Pinochet

Friedman's trip also included numerous meetings with members of the government. He knew well in advance of the trip that, at a minimum, the government officials whom he would be meeting would include former University of Chicago students now having economic positions in the regime (*Reason* magazine, August 1977, p. 25). Such meetings took place, but, in addition, Friedman during his trip met with members of the ruling junta. In particular, on March 21, 1975, he had a 45-minute meeting with Pinochet, with Harberger, L*ü*ders, and others also in attendance.[154] Friedman, in an *aide memoire* written shortly afterward, noted that, in recommending sharp monetary and fiscal restriction as well as free-market reforms, "I was probably just repeating what others had said" to Pinochet.[155] As already indicated, the junta was, at that time, considering the adoption of economic measures recommended, in good part, by some of the Chilean-based University of Chicago-trained economists. Friedman also voiced at the meeting the view that economic liberalization would promote forces of political liberalization (Edwards and Montes, 2020, p. 110). This position lined up with a major theme in many public statements he had made on economic and political freedom. The linkage that he perceived, as outlined in those statements, will be discussed further below.

In his 1998 memoirs, Friedman acknowledged that his having this meeting provided an "iota of substance" to the characterization that his critics would give of him of being a Pinochet adviser.[156]

States during 1976: see Friedman (1976j, 1976k). Of these, the latter Friedman reference was a printing of the speech in the *Congressional Record* instigated by Senator Barry Goldwater.

[153] See, for example, *Reason* magazine, August 1977 (p. 25), *Newsweek*, January 12, 1981, and Friedman (1977k, p. 491).

[156] Friedman and Friedman (1998, p. 399).

Post-trip correspondence with Pinochet

At their meeting, Pinochet asked Friedman to write his recommendations down in a post-trip letter. Friedman did so, in a letter dated April 21, 1975.[157] Friedman would make statements in later years that—with the important exception of the negative subsequent U.S. media commentary that it generated—"I have no regrets" about the fact that he had gone to Chile (*Business Week*, November 1, 1976, p. 75) and that he "would not hesitate to do it again" if he had his time over (*Reason* magazine, August 1977, p. 25). He further indicated that "I do not regret the advice I gave there" (*Business Week*, November 1, 1976, p. 75). With regard to the April 1975 letter, however, it may well have been a different story. He likely started to acquire doubts very quickly about whether he should written it. Friedman's concern about it coming into the public record was indicated in correspondence that Friedman wrote to his former student, U.K. financial journalist Samuel Brittan. In the letter to Brittan dated August 21, 1975, Friedman enclosed the letter of recommendations regarding Chile but suggested that, as it had been a letter addressed to Pinochet directly, it might be preferable for Brittan to destroy the enclosure after reading it.[158]

This vantage point of August 1975 was an early time in the controversy and, in subsequent years, Friedman found that he had to discuss his involvement with Chile over and over again. Indeed, his 1998 memoirs with Rose Friedman included not only a twelve-page chapter on Chile, but also a further twelve pages, in small print, about Chile, comprising the authors' Appendix A.[159] That appendix, although it collected several of Friedman's key replies to critics during the height of the controversy in the mid-1970s, also underlined a key weakness and inaccuracy of his early rebuttals. As detailed below, Friedman's rebuttals stated on multiple occasions that his contacts with the Chilean government had been wholly contained within his March 1975 trip to Chile. But the appendix provided the hitherto unpublished April 1975 letter to Pinochet, as well as Pinochet's reply of May 16, 1975.[160]

The Friedman letter to Pinochet had put in written form the policy recommendations that he had

[160] See Friedman and Friedman (1998, p. 594).

made while in Chile and so was linked to that trip. But its existence rendered unequivocally false the blanket statements—which he would make in 1976, in particular—that his contacts with the Chilean government had been limited solely to the trip.

More specifically, the fact that the trip had been followed up by correspondence undermined one of his specific defenses: that, as he put it in 1984, the trip had been his "only involvement in the Chilean business" (*California* magazine, October 1984, p. 77). "I had not seen any Chilean official before that; I have not seen and have had no contact with Chilean officials afterwards," he remarked on television (*Meet the Press*, NBC, October 24, 1976, p. 3 of transcript). In a number of replies to criticisms (for example, *Newsweek*, June 14, 1976*b*), he similarly described the March 1975 trip as "my only contact with Chilean governmental officials."[161] And in *Business Week* (November 1, 1976, p. 75), he stated: "I had no contact with people in Chile prior to the visit, and have had none since."[162]

Subsequently, in early 1977, Friedman remarked (*Stanford Daily* (Stanford University), January 31, 1977, p. 1), "I have had no contact with any official of Chile since then," and his interviewer seemed to take "then" as being March 1975. The following summer, he stated: "Since leaving Chile, I have had no advising or counseling contact with anybody in the Chilean government." (*Reason* magazine, August 1977, p. 25.)

In December 1977, in the high-profile venue of a *New York Times* interview, Friedman relayed the important piece of information that, post-trip, he had sent a write-up of his analysis of Chile to Pinochet and to the other individuals who had been at their meeting (*New York Times*, December 2, 1977). This was the letter that would see print in his memoirs in 1998.[163]

In some of his pre-December 1977 characterizations of the degree of his contact with Chilean officials, Friedman may have been trying to include the post-trip letter under the umbrella of his trip. But the existence of the letter meant that the categorical statements that he made before December 1977 indicating that his contact with the Chilean government had been wholly limited to his March 1975 travel to Chile were certainly not literally accurate.

[161] Friedman used identical wording in *Daily Telegraph* (London), June 13, 1977, except to say "government" rather than "governmental."
[162] Also quoted in *Edwardsville Intelligencer* (Illinois), November 3, 1976.
[163] Especially in view of the fact that it had multiple recipients, the existence of the letter-memorandum was very likely public knowledge before 1977, and reference to it may have occurred in the course of what the *New York Times* (March 21, 1976) characterized as the virtually-every-week references to Friedman in the Chilean press.

The initial post-trip backlash, April to December 1975

The initial public controversy in the United States concerning Friedman's trip spanned the period from April to December 1975. As this period opened, the Pinochet junta was being further ostracized in international circles, with its human-rights abuses receiving additional scrutiny. For example, the London *Times*—which had been very critical of the Allende government—editorialized that Pinochet's "internal political policies" were causing "Chile's economic isolation" in the international arena, and it added: "Evidence of torture, arbitrary arrest[,] and imprisonment without trial is now overwhelming." (*The Times* (London), April 19, 1975.)

The news about the Pinochet regime's ongoing abuses came against a background of greater details emerging about U.S. government involvement from 1970 to 1973 in undermining the Allende administration. On September 7, 1974, six months before Friedman's trip, it had already been revealed that in the previous April that the CIA's director William Colby had confirmed to a Congressional committee that $8,000,000 had been allocated in 1970 to 1973 for various U.S. operations against the Allende Government (Carruth, 1993, p. 702). The end of 1975 would see further details come to light, with the disclosure on December 4, 1975, that the U.S. government had spent $13,400,000 from 1963 to 1973 on Chile-related covert activities.[164]

Attention to Chile in the United States from 1973 to 1976 was therefore high because of the Pinochet junta's abuses and because of the revelations about U.S. government interference in pre-1973 political developments. But there was, from 1975 on, a further major factor drawing world attention to Chile: the fact that its economic policy changed sharply.

As Friedman would later note on numerous occasions, University of Chicago-associated economic policies against inflation, involving a major demand restriction, had not been implemented by the Pinochet junta in 1973 or 1974.[165] Rather, policies of this kind were introduced in the spring of 1975 (Van Overtfeldt, 2007, p. 350)—more specifically, around April and early May 1975 (*New York Times*, May 6, 1975; *Wall Street Journal*, November 4, 1975, p. 1). The package implemented, comprising severe monetary and fiscal restriction alongside free-market reforms, was unambiguously associated with the University of Chicago, as it was

---

[164] See Caruth (1993, p. 714). The December 1975 disclosures, resulting from Congressional inquiries, are discussed further below.
[165] See, for example, *California* magazine (October 1984, p. 77), Friedman (1991b), and Friedman and Friedman (1998, p. 398).

designed in large part by a portion of these graduate students who later worked in economic posts in the government of the Pinochet junta. This group became widely referred to as "the Chicago Boys."[166] As Friedman's *aide memoire* of 1975 noted, the package was already being contemplated by the government while he was visiting the country. But the fact that its actual adoption came soon after his trip would compound the perception of a strong link between himself and the regime—and the related interpretation that the package was designed personally by himself.

Such interpretations started appearing in the U.K. and U.S. press in the spring and summer of 1975. The London *Observer* of April 27, 1975, stated: "This week, Pinochet's economic overlord, Jorge Cauas, announced a package of austerity measures, designed by the conservative U.S. economist Milton Friedman, to try to shock the economy out of the present raging inflation and save it from complete bankruptcy." In the *Houston Post* of July 14, 1975, columnist W.D. Bedell wrote that Cauas' "actions were reportedly based on advice received from Milton Friedman, the University of Chicago economist who visited Chile in March," while noting that "Friedman is said to have advised 'shock treatment' for the economy." Bedell later linked the policy change further to Friedman's visit by describing Cauas as "a disciple of Friedman" who "had already begun to put some Friedman theories of unshackled enterprise into practice in Chile and after the Friedman visit this process was stepped up" (*Houston Post* (Texas), November 17, 1975).

By the time of Bedell's second column, the controversy in the United States about Friedman's visit to Chile had risen in profile, in large part because of prominent coverage in the *New York Times*. Friedman would sometimes give a highly critical piece written by the newspaper's regular columnist Anthony Lewis (in the edition of October 2, 1975)—an article discussed further below—as what really launched the controversy (Instructional Dynamics Economics Cassette Tape 179, October 1975, Part 2; *Newsweek*, January 12, 1981). But he would later trace the onset of the U.S. controversy to another, earlier *New York Times* article—a front-page news

---

[166] Friedman himself on occasion referred to "the so-called Chicago Boys" (*Newsweek*, January 25, 1982; Friedman, 1991b, p. 2; *Wall Street Journal*, January 8, 1991), and he also accepted and deployed the "Chicago Boys" terminology in Friedman and Friedman (1998, pp. 398, 408). Dornbusch (2001, p. 20) noted the fact that the term tended to be used in relation to the former students both by critics and defenders of the economic prescriptions with which they were associated.

As the present discussion concerns the controversy, in U.S. public debate during the 1970s, swirling around Friedman on the matter of Chile, a detailed discussion of the Chicago Boys or of Chile's economic policy and economic outcomes is certainly beyond the scope of this account. See Edwards and Edwards (1987) and Edwards and Montes (2020) for background and references on these subjects.

report of September 21, 1975.[167] This article had discussed Chile's current, 40-year-record, rates of unemployment and had observed: "The guiding light of the junta's economic policy has been Milton Friedman, a conservative economist from the University of Chicago who visited Santiago shortly before the 'shock treatment' program took effect. The 'Chicago Boys,' as the junta's economic advisers like to call themselves[,] slashed public spending, restricted bank credits[,] and slowed the printing of money." (*New York Times*, September 21, 1975, p. 30.) The following day, an editorial in the *New York Times* stated that "the economic chaos left by Dr. Allende's Marxist administration" had continued, and in this connection suggested that 20 percent unemployment and a continuing "fantastic inflation rate" should be the basis for judging that "after many months of applying Prof. Milton Friedman's monetary theories and harsh austerity programs," the measures had not succeeded (*New York Times*, September 22, 1975).

The surge in national attention toward Friedman on the subject of Chile in the late September/early October 1975 period had an effect on his day-to-day activities at the University of Chicago, as student protests arose from the controversy. He had experienced campus picketing in the past, notably when giving a talk in California in 1966/1967 year (*Fortune*, June 1, 1967, p. 131). But the University of Chicago in the late 1960s and early 1970s had been seen as a major academic institution that avoided many of the disruptions seen elsewhere, with the university's administration having established a harder disciplinary line against student protests (*The Ithaca Journal* (New York), March 4, 1970). Friedman had highlighted this aspect of the university's experience in a *Newsweek* column at the time (April 14, 1969), although the same discussion had expressed doubt about whether the protest-related violence seen on other campuses might be avoided at his own institution in the future. In early 1975—before his Chile trip—Friedman recounted that the University of Chicago had had only a limited experience with the student protest movement of the late 1960s and also implied that the United States' experience of major student protests was now long past (Instructional Dynamics Economics Cassette Tape 163, early February 1975).[168] Even in December 1975—by which time he had become the subject of sustained student protests—Friedman was referring to the protest era in the past tense when he referred to the "times of trouble during the late 1960s when many universities in this country were subjected to disturbances and disruptions."[169]

[167] Friedman and Friedman (1998, p. 401).
[168] In both the 1969 and 1975 discussions, Friedman credited the university's administration with stalling the momentum of the protest movement by swiftly applying penalties to those students who generated disruptions.
[169] Friedman (1976j, p. 561).

But as he said these words, U.S. campus protest activity was actually obtaining new vitality in the Greater Chicago area, in the wake of adverse responses to Friedman's visit to Chile. The University of Chicago's student newspaper, the *Chicago Maroon*, stated (October 3, 1975*a*, p. 1): "Left-wing campus and area organizations… have formed a united front to protest the involvement of University professors Milton Friedman and Arnold Harberger in policymaking for the ruling military junta in Chile." The article indicated that the new committee described its aim as to "drive Friedman and Harberger off the campus" (p. 3).

The same October 3 issue of the *Chicago Maroon* had multiple articles on the Chile controversy and the emerging local protest movement. On the same day, there was a campus rally attended by about 225 people (*Chicago Daily News*, October 3, 1975). There would be a string of student protests and other demonstrations on the University of Chicago campus in 1975−1976 against Friedman. Some of them were held outside his Price Theory classes (Gloria Valentine, interview, April 1, 2013). Another incident occurred on February 28, 1976, when the University of Chicago hosted a panel on the topic of government spending that also featured Northwestern University's Robert Eisner (in one of the last of the plethora of debates that Friedman had held over two decades with that locally based Keynesian). About six protesters attended and caused multiple interruptions (*Daily Northwestern* (Northwestern University, Illinois), March 1, 1976).

A measure of the degree to which Friedman, despite a long record of controversy, was unaccustomed to picketing and protesting until this point was brought out by the fact that, in 1975, Friedman included his home address in Chicago in his *Who's Who in America 1976* entry (Marquis Who's Who, Inc., 1976, p. 1080).

In the October 3 issue of the *Chicago Maroon*, Friedman provided for the newspaper's printing a private letter that he had written in July in defense of his trip.[170] In one of many underestimations that he would make of the scale of the controversy, Friedman suggested that his putting of this letter into the public record would be his only comment on the matter (*Chicago Maroon*, October 3, 1975*c*, p. 1).

The Friedman letter (*Chicago Maroon*, October 3, 1975*a*) included many of the arguments that he would make subsequently, including that the economic liberalization that he supported would

[170] Although the published version of the letter deleted the identity of the individual to whom he had addressed, the coverage of the letter in *Business Week* (January 12, 1976, p. 70) essentially identified the recipient as Gerhard Tintner. Later discussions such as Farrant (2020, p. 117) have confirmed this identity.

improve the lot of the populace and help speed the restoration of political freedom.

The campus controversy was reported in the city-wide Chicago press on October 3 and 4, 1975. The press coverage included remarks by Harberger in which he cited support for his former students (*Chicago Daily News*, October 4, 1975): "I am eager to be supportive as I can of my former students in their efforts to improve the economy of Chile or any other country. I won't be bulldozed into turning my back on men I perceive as honorable."

In contrast, Friedman was reported to be in Vermont and unavailable for comment. But he would soon realize that his intention to refrain henceforth from commenting on the matter was unsustainable, and he provided a long discussion of the controversy later in the month on his audio commentary series. Friedman's discussion recognized, as Harberger's had, that there was heterogeneity among their former graduate students on the matter of serving in the junta regime: "Some of them have become refugees from Chile under the present government, but some of them decided that they could contribute more to their country by staying and working within the government." (Instructional Dynamics Economics Cassette Tape 179, October 1975, Part 2.) Reflecting the continued national interest in the controversy, Friedman's *Chicago Maroon* letter was reprinted in the *Wall Street Journal* near the end of the month (October 27, 1975).

Although Friedman was, in this letter and elsewhere, at pains to stress that he was not the designer of Chile's new economic policy, he also made clear that he believed that that policy was appropriate.[171] "If they can hold on for a few more months, I have great confidence you'll see some good things from the economy." (*Wall Street Journal*, November 4, 1975, p. 37.) Friedman's general opposition to *U*-turns in times when monetary restriction was being applied against inflation at the cost of recession was something he had voiced in the U.S. context on numerous occasions. Urging that aggregate demand policy not change course in the more drastic economic situation that Chile experienced in 1975 was, therefore, consistent with Friedman's preexisting posture. But, combined with the fact that Chile was a dictatorship, Friedman's injunctions against *U*-turns likely reinforced critics' portrayal of Friedman as "Draconian," as the heading of a *Business Week* item on the matter put it (January 12, 1976). The *Business Week* article in question ended with a Friedman quotation on the Chilean demand restriction: "My only

---

[171] Harberger, too, had stated (*Chicago Maroon*, October 3, 1975*c*, p. 1): "the government budgetary policy in the broad, and the monetary policy treated broadly, both in a general way correspond to what I believe and to what Professor Friedman was saying."

concern is that they push it long enough and hard enough" (p. 72), and this quotation was, not surprisingly, later highlighted by Naomi Klein (2007, p. 101).

Controversy in January-September 1976

The January 1976 *Business Week* article was an early entry in a major buildup over the course of 1976 in the American and U.K. media in the controversy over Friedman and Chile. By late October 1976, the accumulation of coverage had led him to complain about "the utter irresponsibility of American publications, including *Business Week*, in dealing with this." (*Business Week*, November 1, 1976, p. 75.) The specific *Business Week* item to which Friedman was referring was that in the January 12 edition. Although this long article did relay some of the points that Friedman had made in defending himself, it was mainly negative about both him and Harberger, suggesting that they "conducted themselves inappropriately by granting numerous public appearances and media interviews while in Chile," while expressing doubt about Friedman's contention (subsequently confirmed, as noted above) that he had called for political freedom during his public appearances (*Business Week*, January 12, 1976, pp. 70, 71).

The *Business Week* article also underlined the U.S. government's involvement in Chile's internal affairs during the Allende years. A hearing was held on December 4–5, 1975, by the U.S. Senate's Select Committee To Study Governmental Operations With Respect to Intelligence Activities on Covert Action in Chile, 1963−1973. The published volume of testimony was accompanied by a staff report. A report author, William G. Miller, in summarizing its conclusions, noted: "In the period 1970 through 1973, in order to prevent a Marxist leader from coming to power by democratic means, the United States worked through covert action to subvert democratic processes. The means used went far beyond those used in 1964 in money [spent], propaganda, and political manipulation. The means used were economic warfare, the encouragement of a *coup d'etat*[,] and military violence." Miller's testimony further recorded that much of the covert U.S. effort had been intended to tilt the balance in favor of a rival political party, but this move had backfired, because the junta had instead assumed permanent control of the country, instead of ceding rule to a multiparty political system.[172] Another staff member, Gregory F. Treverton, elaborated at the same hearing: "After the coup[,] the military junta moved quickly to consolidate its political power. Political parties were banned, Congress was put in indefinite recess, and censorship was instituted. Supporters of Allende and others

[172] Testimony of December 4, 1975, in Select Committee To Study Governmental Operations With Respect to Intelligence Activities, U.S. Senate (1976, p. 5).

deemed opponents of the new regime were jailed, and the military leader, Augusto Pinochet, indicated that the military might have to rule Chile for two generations."[173]

Garthoff (1994, p. 403) referred to "the suspicion of American involvement (later confirmed in part)" in the overthrow of Allende and the events leading up to it, and the Congressional inquiries contributed to this process of documenting the U.S. government's attempts to influence developments in Chile during 1970 to 1973. It was against the background of these revelations that Democratic presidential candidate Jimmy Carter, in the televised debate that he had with President Ford on October 6, 1976, named among the "kinds of things [that] have hurt us very much" in international standing "the destruction of elected governments, like in Chile."

The January 1976 article in *Business Week* pointed to a "new ingredient" that linked together the news stories of Chile's new economic policy and the U.S. policy against Allende. Specifically, the Senate committee's recent revelations included the fact that some of the CIA funds had involved the financing during the Allende years of critiques of government economic policies, with the Chilean economists who wrote these critiques included numerous University of Chicago graduates. In this environment, in late 1975 and early 1976 Friedman felt it necessary both to reject the notions that he was involved in the 1973 coup itself—"I had nothing to do with [the junta's] establishment" (*Chicago Maroon*, October 3, 1975*a*)—and that he had ever participated in any covert operations: "I have never had any knowing relationship with the CIA; nor, to my knowledge, have my colleagues," he remarked to *Business Week* (January 12, 1976, p. 70). Friedman felt that, although the *Business Week* piece quoted this denial, the article as a whole implied that he was lying about the matter, and he looked back on the report as having been "generally highly critical of Al [Harberger] and me an included the utterly fallacious allegation that we had 'uncomfortably close ties' with the Central Intelligence Agency."[174]

The issue of the junta came up in an interview that Friedman recorded in Chicago on May 11, 1976 and that was broadcast on U.K. television in mid-July. Interviewer Peter Jay asked a question that, in its formulation, took for granted that Friedman supported the junta's rule. "I have never given any public support to the political regime in Chile," Friedman shot back, adding reproachfully to Jay: "I beg your pardon." Friedman went on: "I have visited Chile for six days. While in Chile, I talked about the disease which Chile was faced with—namely,

[173] Testimony of December 4, 1975, in Select Committee To Study Governmental Operations With Respect to Intelligence Activities, U.S. Senate (1976, p. 17).
[174] Friedman and Friedman (1998, p. 402).

inflation. I tried to analyze it and talk about Chile. But never in Chile or outside of Chile have I supported the military junta. I have said that Chile was faced with a very difficult choice between—after the Allende regime, with inflation running at seven [or] eight hundred percent a year—was faced with a very difficult choice. And it came out—it was faced with a choice between two alternative totalitarian systems, both bad." The latter remark alluded to Friedman's view—which he had elaborated in the letter published early in the previous October—that Chile's economy had reached a condition that meant that the country was poised to become either a Communist totalitarian state or a military dictatorship.

In the United States, the controversy was raised in Friedman's regular media outlet of *Newsweek*, when a letter (June 14, 1976*a*) from a Minneapolis-based humanitarian group stated that it wished to express its members' "shock and dismay on learning Milton Friedman has been serving as an economic adviser to the Pinochet Chilean junta" and implied that Friedman should be dropped as one of the magazine's columnists. Friedman's reply acknowledged the trip and his having met with Pinochet while in Chile, but rejected the letter's description of himself as an economic adviser to the Pinochet junta, while adding: "I do not regard it as evil for an economist to render technical economic advice to the Chilean government to help end the plague of inflation." (*Newsweek*, June 14, 1976*b*.)

In a speaking appearance in London on August 31, 1976, upon being asked about Chile's economic program, Friedman exasperatedly articulated an observation that he would restate many times in subsequent years: "In the first place, let me make one point clear. I have not been guiding the economic policies of Chile!" As he would many times in later years, he expressed infuriation at being implied in the media and by critics to be "guiding the day-to-day policies of that government." He went on, however, to suggest that, although "I have not studied the recent statistics myself," it seemed that Chile's inflation had fallen substantially and that the period of recession associated with the new policies might have ended.[175] In a further talk given the following day, Friedman suggested that Chile's problem of a 20 percent per month inflation rate justified a shock-treatment policy rather than a gradualist policy: "the only sensible thing to do is a shock treatment, in which you make a very sharp move… and try to bring the inflation rate down to your long-term objective in a very short period."[176] He stressed that, nevertheless, he did not mean that this should involve trying to achieve a zero inflation rate immediately and that even a non-gradual or shock-treatment policy should, instead, consist of a multi-year program of

---

[175] Friedman (1977i, p. 37), also in Friedman (1991a, p. 144).
[176] Friedman (1977i p. 45), also in Friedman (1978b, p. 70; 1991a, p. 151).

reductions in monetary growth and public spending.[177] But Friedman made clear that this recommended policy was still a major contrast with a gradualist program of the type he would recommend for a country like the United States.[178]

Intensified criticism, October-December 1976

On *Meet the Press* on October 24, 1976, Hobart Rowen—the *Washington Post* economics reporter and commentator who was more accustomed to asking Friedman about U.S. monetary policy topics—used the occasion of Friedman's appearance to bring up a major recent international incident. "Dr. Friedman, a few weeks ago in Washington, a man named Orlando Letelier, a former Chilean ambassador to the United States, and a former foreign minister under the Allende regime which preceded the existing military junta, was brutally killed." It would be confirmed that the Chilean government was responsible for Letelier's assassination. Letelier had been an outspoken critic of the junta, and Rowen noted that this criticism had extended to Chile's economic policy and to Friedman himself: "Just a few weeks before that, he had written an article for *The Nation* magazine [August 28, 1976] in which he condemned you for providing what you call technical advice to the Chilean government."[179] Rowen then asked Friedman to defend his role—in doing so, posing the question that was quoted early in this chapter. Owing to Letelier's activism on the economic dimension of the junta's policies, the uproar over the Letelier assassination escalated the public controversy over Friedman and Chile (see Edwards and Montes, 2020, p. 117)—a fact that Friedman acknowledged in his memoirs.[180]

Also giving impetus to the controversy in this period, of course, was the surge in attention toward Friedman generated by the October 14 announcement of his 1976 economics Nobel.

---

[177] He had earlier stated that an approach to reducing inflation in which the authorities were "forced to stop it brutally—the way in which the Brazilians did in 1964" comprised too rapid a disinflation (*Newsday* (BBC2 television program), September 20, 1974, p. 5 of transcript). The parallels between Brazil's 1960s inflation experience and that of Chile in 1970s were, however, limited by the fact that, in annual data, Brazil's peak rate was about 86.6 percent, in 1964 (Krieger, 1974, Table 1, p. 44), while Chile's inflation was over 600 percent at the end of 1973 (Edwards and Edwards, 1987, Table 1–2, p. 10; see also Velasco, 1994, Table 8–2, p. 391).
[178] Friedman (1977i, p. 45), also in Friedman (1978b, p. 71; 1991a, pp. 152–153). In his letter to Pinochet, Friedman had suggested that "a shock program could end inflation in months" (Friedman and Friedman, 1998, p. 593). This was not necessarily incompatible with his public statements that a drastic program could nevertheless involve taking years to eliminate inflation though, if it was, it certainly was a simplification of the latter statements. Friedman seemed to have in mind getting annual inflation in Chile down to about 30 percent per year as an appropriate intermediate step, as he associated such a rate with conditions that Chile was long been accustomed to (*Stanford Daily* (Stanford University), January 31, 1977, p. 1).
[179] *Meet the Press*, NBC, October 24, 1976, p. 2 of transcript.
[180] Friedman and Friedman (1998, p. 402).

Two letters, each signed by two past Nobel Prize winners, were published in the *New York Times* criticizing the fact of the award to Friedman: one by George Wald (a 1967 medicine Nobel laureate) and Linus Pauling (a double Nobel laureate, in chemistry and peace), and one by David Baltimore and S.E. Luria, each of whom had won a medicine Nobel (*New York Times*, October 24, 1976*a*, *b*). These letters, which appeared on the same Sunday as the *Meet the Press* interview, were both dated ten days earlier, October 14. In his memoirs two decades on, Friedman commented sarcastically on the notion that the two letters were produced "independently" of one another and implied that it was likely that the two pairs of authors were in contact with each other when they decided to write their letters.[181] He was likely correct on this point. But it was hardly a startling practice for the generation of public letters of this kind to involve some degree of coordination.

One of the letters was worded in a manner that preempted one of Friedman's objections to the manner in which his role in the controversy had been characterized. While the Baltimore-Luria letter referred to Friedman as "a major economic adviser and supporter of the Chilean junta," the other letter, by Wald and Pauling, quoted Letelier as having described Friedman as "the intellectual architect and unofficial adviser for the team of economists now running the Chilean economy." Wald and Pauling's use in this manner of the qualifier of "unofficial" came after Friedman's June 1976 reply in a *Newsweek* letters column (June 14, 1976*b*) maintained again that he was "not now, and never have been, an economic adviser to the Pinochet Chilean junta." He would repeat this formulation in the London *Daily Telegraph* of June 13, 1977, and in October 1977 he took issue with protest leaflets that "referred to me as an economic adviser to the Chilean government."[182]

Friedman continued to eschew the "adviser" label in later years: "I have repeatedly denied this libel in print," he remarked near the end of the 1970s (*Human Behavior*, March 1979, p. 10), "I have never advised the government of Chile," he remarked in the mid-1980s (*California* magazine, October 1984, p. 77), and in the early 1990s he stated, "I never advised Pinochet" (CSPAN, November 16, 1991).[183]

---

[181] Friedman and Friedman (1998, p. 403). Friedman also implied that the fact that the letters were both written on the day of his prize announcement suggested some kind of orchestration, but he did not go into detail regarding his speculation (p. 597).
[182] Friedman (1977k, p. 491).
[183] Similarly, in answer to a question posed by an audience member who was a Chilean refugee, Friedman had remarked during a speaking appearance in Glasgow: "I am not, and never have been, an adviser to the Pinochet regime. I spent six days in Chile, two [sic; three] years ago. I gave a series of public lectures. I met and talked with General Pinochet and a number of his advisers, just as I also met and talked with some of the political opponents of

The central point underlying Friedman's resistance to the "adviser" description was that he did not have, and had not had in 1975, a formal affiliation with the Chilean government. Related to this was the fact that, during his 1975 trip, including in his meetings with the junta, his activities did not involve remuneration from the regime—"I never got a penny from the Chilean government" was one way in which Friedman later expressed this aspect of the matter (CSPAN, November 16, 1991).[184]

These points made Friedman well positioned to reject implications that he was an official adviser. And he did so, as when he stated (*Reason* magazine, August 1977, p. 25): "I emphasize that I was not then and I never have been an official adviser in any way to the [Chilean] government." Friedman similarly rejected the label of formal adviser: Harberger had remarked earlier in the controversy (*Chicago Daily News*, October 4, 1975): "I can assure you that Milton is not serving as a formal adviser to the Chilean government," and two years later Friedman himself remarked more generally: "I have not been willing and I am not willing to adopt any position as a formal adviser to the Israeli government—or any other government." (*The Australian*, October 27, 1977.)[185] In this same period of October 1977, he observed: "I have always refused to be a formal economic adviser to the U.S. government. I have been an informal adviser to anyone who wants to listen to what I have to say."[186]

But Friedman could not deny that he had expressed views on appropriate economic policy to the Chilean government in the spring of 1975. And his remarks published in the *Chicago Maroon* in October 1975 stating that "I do not regard giving advice on economic policy as immoral" may have been mainly a general statement intended to encompass employed economic advisers to dictatorships, but it may also have been intended to cover his own trip, to Chile, and he himself

---

the regime. At no time have I ever endorsed the Pinochet regime in Chile. You have my deepest sympathy for the tragedy that has overtaken your country." (*The Scotsman* (Edinburgh), April 22, 1978.)

[184] Friedman's focus on this point may have been partly motivated by the fact that Lawrence R. Klein had largely escaped criticism for providing economic analysis for the economic policymakers in Brazil's dictatorship that probably was remunerated by the government. Both Lawrence Klein and news coverage had distinguished the provision of his analysis from what Friedman had provided in Chile in 1975 partly on the ground that the economic analysis that Lawrence Klein had provided had been of a technical character (*Business Week*, January 12, 1976, p. 70). Friedman had stressed that he considered the analysis that he had supplied in Chile in 1975 was also technical, in focusing on how to bring down inflation.

[185] Similarly, he stated later in 1977: "I have never been an economic adviser to any country, including the United States." (*New York Times*, December 2, 1977.)

[186] Friedman (1977k, p. 491). In fact, there was a degree of formality in the 1970s in Friedman's manner of providing advice on the U.S. monetary policy side, as he was an occasional attendee of the Federal Reserve Board's outside consultants' meetings through 1978 and was a Federal Reserve Bank of San Francisco visiting scholar in 1977. The latter position will be discussed in the next chapter.

would later remark that, when he was in Chile in 1975, he was "giving them advice."[187] Likewise, earlier, on television during the peak of the controversy, he referred to "the advice I gave to the Chileans" as having been "technical advice in the sense of laying down an analysis of inflation" of the kind he had "given… in many places" (*Meet the Press*, NBC, October 24, 1976, p. 3 of transcript). In light of such acknowledgments, he could concur with characterizations to the effect that he had relayed advice, even though his provision of advice was not on an ongoing basis.

Friedman therefore did not wholly eschew the "adviser" description, insofar as it was applied to anyone who had been in the activity of giving advice. He rejected its typical application to himself in the context of Chile, however, because his critics often imputed to himself an insider status consisting of an ongoing, and considerable, role in within-government economic-policy discussions. But, as the Wald-Pauling letter to the *New York Times* showed, critic could help forestall Friedman's outright rejection of the adviser label by calling him an "unofficial adviser." The use of the formulation (or the similar one "informal adviser") made it hard for Friedman to claim literal inaccuracy in the label of himself as an adviser. Rather, he continued to stress that his interaction was contained to 1975 and also focused on the fact that he had not been paid by the Chilean government.

These points found expression in Friedman's later emphasis on indicating that he had not been a "consultant" to the Pinochet junta.[188] Harberger had earlier said of Friedman and himself in their 1975 trip (*Wall Street Journal*, December 10, 1976*a*): "we were not there as consultants to the government." Friedman likewise later stated, "I was only there six days, [and] I was not an official consultant or anything like that" (*The Observer* (London), February 17, 1980, p. 35). In early 1991, he observed, with regard to the question being put to him of the kind, "How do you justify having served as consultant to Gen. Pinochet when he was the dictator of Pinochet?," "The short answer [is], 'I never did.'" (*Wall Street Journal*, January 8, 1991.)

The Stockholm trip and the Nobel events

By late 1976, it had become routine for Friedman's scheduled public appearances to lead to him

[187] Friedman (1982d, p. 61).

[188] Friedman had sometimes been characterized as having been a consultant. For example, a *New York Times* report (February 20, 1976, p. 47) stated of Friedman and Harberger: "They have engaged in economic consulting activities in Chile and have encountered criticism for doing so."

facing Chile-related demonstrations: Al Harberger would recall that they were now occurring "every place he went practically, including when he received the Nobel Prize—there were demonstrations in Stockholm against him." (Arnold Harberger, interview, April 12, 2013.)

During their week in Stockholm in December 1976 for the Nobel festivities, the Friedmans had a 24-hour police guard, on the Swedish authorities' advice (*Newsweek*, January 12, 1981).[189] Although, after Friedman delivered his Nobel lecture late in his stay in Stockholm, the content of his lecture (on the subject of inflation and unemployment) did receive worldwide media coverage, many of the headlines in the days leading up to his lecture instead concerned the protests and questioning that he was facing on the matter of Chile.

"Milton Friedman is in Stockholm to accept his Nobel prize," a *Wall Street Journal* editorial supportive of Friedman began (December 10, 1976*b*). "He spent two hours at a press conference [on] Tuesday [December 7] not explaining his economic theories but defending himself against accusations of being somehow responsible for dictatorship in Chile."

The editorial was referring to the fact that, in a cramped conference room in the building of the Royal Swedish Academy of Sciences, Friedman had appeared before a hundred members of the media, many of them asking hostile questions. "You people have such a distorted idea of what's going on," Friedman remarked angrily as the questions piled up. He remarked in the session: "I do not believe in Chile more than I believe in dictatorship in Russia. I am for a free society." (*Boston Globe*, December 8, 1976.)[190]

Another comment that he made at the press conference—"My first ambition is to survive all this" (*Chicago Daily News*, December 8, 1976)—did not sound like a remark coming from someone who was enjoying himself—and so seemingly underlined the pall that the protests and media criticism were clearly casting over Friedman's participation in the Nobel events. But, in making this observation, he was also referring to the fact that he was now beholden to the frenetic and prearranged agenda that his Swedish hosts were putting on him and the other Nobel winners. Friedman was able, in the period following the week in Stockholm, to reflect on pleasant aspects of the formalities of the Nobel events in which he and Rose Friedman had

---

[189] See also Friedman and Friedman (1998, p. 447), who indicated that police vehicles accompanied the car that took them from Stockholm's airport and that they had two bodyguards during their trip.
[190] Another report, possibly giving its own rendition of the first of these sentences, quoted him as saying: "I don't like Chile's dictatorial government any more than that of Russia." (*Chicago Daily News*, December 8, 1976.)

participated, as well as recounting the protest activities.[191]

Likewise, the images of Friedman that appeared in the media during the week in Stockholm brought out some lighter moments—including him sharing a laugh with the year's Nobel literature prize recipient. Saul Bellow. But the press and television coverage also produced a stream of pictures of Friedman looking angry or grim in response to protests or hostile media questions, as well as of himself and Rose Friedman being accompanied by security protection.

The centerpiece of the official festivities in which Friedman participated was the conferring, at a ceremony on December 10, of the Nobel awards to the 1976 recipients. When Sweden's King Carl XVI Gustaf was bestowing the medals and came to Friedman, an audience member—described in a later article, apparently quoting Friedman, as a "young man who had sneaked in on his father's ticket" (*Stanford Daily* (Stanford University), January 31, 1977, p. 1)—interrupted the event: this "single demonstrator in white tie and tails jumped up," a news report noted, and called out words of protest related to Friedman and Chile (*The Knoxville News-Sentinel* (Tennessee), December 11, 1976). As the ceremony resumed following the interruption (which had generated a glowering expression, captured by the cameras, on Friedman's face) and the protester's removal, a brief, off-the-cuff remark by the king, expressing relief at the limited nature of the actual disruption, suggested that the monarch may have been warned of the possibility of a larger-scale disruption of the ceremony.[192] There were an estimated 2000 demonstrators outside the building in which the awards were being conferred (*The Knoxville News-Sentinel* (Tennessee), December 11, 1976).

In an interview that appeared in print a couple of days after the ceremony, Friedman remarked of the widely reported criticisms of himself: "The Chilean smear is really disgraceful." He also insisted that the advocates, including economists serving in Chile's government, of monetary control and free-market reforms should not be tarred with the same brush as Chile's junta and that he would himself not be disavowing them: "There are old students of mine down there, and I'll be Goddamned if I'm going to turn my back on them." (*Sunday Times* (London), December

[191] See Instructional Dynamics Economics Cassette Tape 205 (December 1976, Part 2), Friedman (1977j), and Friedman and Friedman (1998, pp. 446–459). The fact that the protests inevitably featured prominently in these accounts was reflected in the Hoover Institution's summary when excerpting Friedman and Friedman (1998): "Milton and Rose D. Friedman recall what it was like when Milton received the Nobel Prize in 1976: The Nobel Committee was gracious enough, but the demonstrators in Stockholm were another matter." (*Hoover Digest*, Fall 1998, p. 7.)

[192] See the footage in *The Power of Choice*, PBS, January 29, 2007. This documentary also has excerpts of Friedman's December 7 press conference.

12, 1976.)

Friedman's criticism of the military dictatorship in and after 1975

A frequent allegation against Friedman in relation to Chile, and one to which he particularly objected, was that because many of its economic policies were ones that he broadly favored, he refrained from criticizing the junta's affront to democracy and violations of human rights. James H. Street, a professor of economics at Friedman's alma mater of Rutgers University, wrote in the *New York Times* (January 4, 1977), "He is only mildly critical of the present Chilean regime." This allegation persisted beyond Friedman's lifetime: for example, Filip (2020, p. 98) claimed that "the brutal regime of Augusto Pinochet was neither criticized nor condemned by Friedman," and Beckett (2015, p. 42) stated that "Friedman neither publicly supported nor condemned the repression in Chile," while, about a year after Friedman's death, television news show host Keith Olbermann spoke of "Friedman's friend, Chilean dictator Augusto Pinochet" (*Countdown*, MSNBC, November 29, 2007).

The pervasiveness of the allegation that Friedman endorsed the repressive nature of the political regime, or was silent about it, was a basis for Arnold Harberger's contention that "there are few economists who have been more unjustly criticized than he in connection with Chile." Harberger cited (as he previously had in December 1976, as noted above) in refutation of this allegation the fact that, while in Chile, Friedman gave "lectures outlining his principle, which he fully believed, that economic freedom *leads to* political freedom. And so he was not silent about his desire to see freedom restored in Chile, political freedom." (Arnold Harberger, interview, April 12, 2013.). Edwards and Montes (2020, p. 129) correspondingly observed that while Friedman's remarks in Chile included assessments "that the political and economic conditions were very negative under President Salvador Allende," it was also the case that "he publicly stated that political and economic freedom had to go hand in hand" and that they did not do so currently.[193]

Similarly, post-trip, Friedman made numerous statements that Chile was not free and had a repressive regime. These statements were often coupled with criticism of other dictatorships in the world, as in the Stockholm remarks above. They encompassed Pinochet's Chile

[193] The concluding two paragraphs of the Edwards and Montes (2020) paper give distinct, and mutually inconsistent, summaries of the content of the remarks that Friedman made in the course of his 1975 trip. Of these summaries, that in the penultimate paragraph, just quoted, is the one consistent with their preceding analysis.

nevertheless. Speaking in Australia shortly after leaving Chile, he stated that Chile was a country in which "a free government was destroyed by inflation" (*The Australian*, April 2, 1975) and stated that it had seen the "destruction of a democratic society by the reaction of a military in taking it over."[194] In a talk in May 1975 given in the United States, Friedman went through the Allende years and added that in the present day "they do not have a free society in Chile." (*Valley News* (Lebanon, New Hampshire), May 8, 1975.) In his *Newsweek* column six months later (November 17, 1975), he referred to the "destruction of personal freedom in Chile." On television the following month, Friedman stated (*The Open Mind*, PBS, December 7, 1975, p. 8 of transcript): "But if you take the road that we have been on, we are heading towards a destruction of our free society and towards a totalitarian society. We are unfortunately headed down the route which Chile has already taken." A few days later, in his December 1975 speech in Utah that was a version of the "Fragility of Freedom" speech that he had delivered in Chile, he referred to "Chile, which has lost its freedom and which today is governed by an authoritarian regime."[195]

The following year, in *Newsweek* (June 4, 1976*b*), Friedman referred to 'my sharp disagreement with the authoritarian political system in Chile." In the new *Business Week* article that appeared after the controversy intensified, he stated, "I did not then and do not now condone the regime in Chile." (*Business Week*, November 1, 1976, p. 75.) In a mid-1977 letter in the U.K. press that was fairly closely modeled on the letter that had been published by the *Chicago Maroon* and the *Wall Street Journal* in 1975, Friedman remarked: "Let me stress again, I do not approve or condone the regimes in Chile or Brazil or Argentina any more than I condone the regimes of Yugoslavia or Russia or the other Communist states. I would fervently wish their replacement by free democratic societies." (*Daily Telegraph* (London), June 13, 1977.) In a *Reason* interview that appeared in the same summer, Friedman stated: "I did not, in Chile or out of Chile, indicate any support of the political policies of the junta. It is a military government, it is an undesirable form of government." (*Reason* magazine, August 1977, p. 25.)

Similarly, in later years, Friedman remarked, "I deplore the loss of liberties in Chile" (*The Guardian* (London), March 1, 1980), and: "I object to the dictatorship in Chile. I expressed these sentiments in Chile when I gave a public speech on the fragility of freedom. I have never endorsed the political policies of the junta." (*The Spectator* (Hamilton, Ontario, Canada), July

---

[194] Friedman (1975i, p. 18).

[195] Friedman (1976j, p. 562; 1976k, p. 31517). In Friedman (1976c, p. 8), this passage appeared with the words "lost its freedom" rather than "lost freedom."

15, 1980). In the early post-junta period, he remarked: "I have nothing good to say about the political regime that Pinochet imposed. It was a terrible political regime."[196]

Friedman's defenses of his 1975 trip

As has already been indicated, Friedman also did not regard support for Chile's economic policy as a blanket endorsement of the regime: "The economic policy, which I commend, can be separated from the political situation, which I deplore." (*New York Times*, May 22, 1977.)[197]

One of the points that Friedman stressed in making this distinction was that his interaction with policymakers and government officials of dictatorships did not begin with Chile. His pre-1975 travels had included visits to various countries in Europe, Asia, and the Middle East that were not democracies. These, however, had uniformly been less commented upon trips. In part, this was clearly because, in Chile, he met the head of government: in his other trips abroad in the period before 1975, it had been uncommon for Friedman to meet the heads of government or of state, whether of democracies or dictatorships. Of the visits to democracies, one exception had been his meeting Prime Minister Edward Heath during Friedman's visit to the United Kingdom in September 1970. But it was only in the early 1980s that meetings with heads of government became a more common feature of Friedman's travels to democracies abroad.[198]

Among the dictatorships that Friedman visited in the period before 1975 were the USSR in 1962 and Yugoslavia in 1962 and 1973.[199] He did not, however, meet these countries' heads of government on these trips.[200] The meeting with Pinochet in Chile in 1975 therefore did not have parallels with Friedman's pre-1975 trips to dictatorships.

---

[196] Friedman (1991b, p. 2).

[197] Friedman made this remark in the course of a letter that he wrote in rebuttal to one of the pairs of Nobel laureates who had criticized his award. Although this follow-up correspondence was subsequently published in the *New York Times,* the Friedman portion of it was addressed to the Nobel laureates, so it was a letter but not (as it is cited by Kuehn, 2019, p. 32) a "letter to the editor."

[198] On his trip to Australia that immediately followed his trip to Chile, there had been arrangements made for Friedman to meet Prime Minister Gough Whitlam—whose office ultimately indicated that, on account of time constraints, a meeting was not possible. See Friedman and Friedman (1998, p. 430).

[199] On the Yugoslavia trips, see especially Friedman and Friedman (1998, pp. 292–294, 423).

[200] The absence of a meeting between Friedman and its dictator Marshal Josip Tito in his trips to Yugoslavia was an item stressed by Farrant (2020, p. 117) as weakening the parallel that Friedman sought to make between his trips to Yugoslavia and to Chile. In a separate criticism of Friedman's parallel with his trip to Yugoslavia, Farrant (2020, p. 117) goes on to imply that Friedman was being untruthful in his statements, which were numerous, that the content of what he said in Yugoslavia was like what he had said in Chile. Instead, without formally citing any Friedman remarks delivered in Yugoslavia, Farrant suggests that they "provided relatively general analyses" pertaining to international monetary matters. Farrant's imputation of untruthfulness on Friedman's part does not seem well

Friedman had, nevertheless, engaged with senior government officials in some of his pre-1975 travels to undemocratic countries: for example, a study that he worked on in 1970 while briefly visiting South Korea (a country that, during parts of the decade of the 1970s, was nominally democratic—but was ruled by the military throughout) contained in its acknowledgments the statement: "I am indebted to Governor Jin Soo Suh of the Bank of Korea."[201] As far as the Yugoslavia visits was concerned, he noted of the most recent (that in early 1973), "in that case, [I] was sponsored by the central bank of Yugoslavia, which is a government agency."[202]

The numerous occasions on which Friedman made references to Communist countries in his discussions regarding Chile were part of his conveying his disapproval of dictatorships of any form. With respect to the controversy over his visit to Chile, the references were also used to highlight the fact that he believed the reaction to his travels to have been asymmetric: the trips to Communist countries had not generated a comparable uproar, and this dichotomy, he suggested, implied a "double standard" on the part of his critics (*Chicago Maroon*, October 3, 1975*a*). Friedman underlined this argument at his December 1976 press conference in Stockholm: "I am being attacked for spending six days in Chile in March last year. But there is a double standard here. When I went to Yugoslavia, I was not attacked for that." (*Boston Globe*, December 8, 1976.)

Further using the Yugoslavia example, Friedman pointed to the fact that he had discussed economic matters with the governments of that and other countries had not led him to receive the label that he had received in much commentary on Chile: "When I go to Yugoslavia, no one describes me as an adviser to the Communist Yugoslav government." (*The Spectator* (Hamilton, Ontario, Canada), July 15, 1980.) Friedman also emphasized the consistency of the economic analysis and prescriptions across forums—"I always say the same thing in public as I say in

---

founded. As it happens, the published lecture given in Yugoslavia did *not* confine itself to general analysis: as indicated earlier in this chapter, Friedman (1973d) was specific on a matter concerning domestic monetary analysis by insisting that the quantity theory of money still held in an open economy. But more crucially, it was a hallmark of the guest lectures and talks that Friedman gave around the United States and in various other parts of the world during the 1970s that he would deliver remarks on both monetary analysis and market economics—so the printed record of the former does not preclude the possible existence of the latter in the case of the Friedman Yugoslavia visits. George Macesich, Friedman's host for much of his time in Yugoslavia, affirmed that, at the Yugoslavia speaking events, Friedman's coverage encompassed both "their [Yugoslavia's] particular economic system and the role of money" and that, on an occasion when Friedman was due to speak at a university in Yugoslavia, an opponent of free-market economics locked the seminar rooms in order to try to prevent the Friedman presentation (George Macesich, interview, May 28, 2013).

[201] Friedman (1971d, p. 846).

[202] Friedman (1977k, pp. 491–492).

private" (*Stanford Daily* (Stanford University), January 31, 1977, p. 1) and across countries—"I gave a series of public lectures in Chile of exactly the same kind that I have given in Yugoslavia" (*California* magazine, October 1984, p. 77).

Friedman believed that disapproval of dictatorships should not be a bar on visiting them: "I do not regard visiting any of them as an endorsement. I do not regard learning from their experience as immoral." (*Chicago Maroon*, October 3, 1975*a*; also in *Daily Telegraph* (London), June 13, 1977.) With regard to the Communist countries, it had, indeed, been official U.S. government policy even in the explicitly adversarial conditions of the late 1950s—well before the détente era discussed later in this chapter—that interaction with those countries, such as by U.S. academics who communicated their thinking on matters to counterparts and officials in the East bloc, should not be precluded and was positively desirable. Foy Kohler, a senior U.S. diplomatic official in the 1950s and 1960s, recalled the U.S. negotiations in 1958 to encourage "cultural, humanities, and informational programs which would have the effect of creating at least a small opening for American influence on the closed Soviet society."[203]

It had also been common by the mid-1970s to have standing official relationships on economic matters between the United States and other democracies with dictatorships. Examples of this in the cases of the OECD and the IMF were given earlier in this chapter. But there were also numerous examples of academic economists and economic-research institutions in the West having relations with members of the governments that were dictatorships. One example—again related to the non-Soviet bloc but Communist country of Yugoslavia—was the fact that Dimitrje Dimitrijevic of the Yugoslav National Bank was a founder member of the Editorial Board of the *Journal of Monetary Economics*, as was indicated in the board membership list on the cover page of January 1975's premiere issue of that journal.

With regard to the Soviet bloc proper, trips by academic economists to bloc countries, either for conferences sanctioned by the ruling Communist government or in visits to official policymaking bodies, had indeed become common by the 1970s. The academic economists who made these trips would likely overwhelmingly have denied, as Friedman did regarding his own trips to dictatorships, that their visits or interactions signified an endorsement of the regime or its repressive practices.[204]

---

[203] Kohler (1979, p. 29).
[204] For example, Zvi Griliches, of Harvard University's economics department, observed that he had given "a number of lectures in Moscow at the invitation of the USSR Academy of Sciences" and that he would have taken

Many of the visits that academic economists made to the East bloc in order to discuss economic theory and policy were to the USSR. But there were also many visits to the Soviet satellites.

A notable example was Hungry. This was a country that Friedman never himself visited before the liberation of Eastern Europe but was one to which he had ancestral ties. During the 1970s and 1980s, Hungary played host to multiple gatherings attended by Western economists. For example, as recorded in Goodhart (1975, pp. 90, 97), the Econometric Society had a meeting in Budapest in the later part of 1972. A couple of years later, the prime minister of Hungary opened the Fourth World Congress of the International Economic Association, which was held from August 19 to 24, 1974, in Budapest (see Machlup, 1976). Still further along, in developing their critique (see Chapter 13 below) of Friedman and Schwartz's *Monetary Trends*, David Hendry of Oxford University and Neil Ericsson of the Federal Reserve Board prepared a paper for presentation at the European Meetings of the Econometric Society, to be held in Budapest in September 1986 (Hendry and Ericsson, 1986).

Friedman, whose trips to the Soviet bloc were sparing, did not attend any of these particular events. But he was very supportive of the notion that such events should proceed, as Friedman, too, believed that the trans-system dialogue should be welcomed and that academics of both blocs should participate. Indeed, he himself was involved on two occasions—during the 1960s and in September 1970—in a regular "meeting between economists of the Eastern European countries and of the Western countries," the 1970 meeting being held in Venice. Friedman noted: "The Eastern European countries represented included Hungary, Romania, Czechoslovakia, Poland, East Germany, Yugoslavia…"[205]

During 1975−1977, however, Friedman felt that his critics were not seeing his 1975 visit to Chile in the same spirit of continuing communications channels open. "I visited Chile, whose government I do not approve. How else can we get ideas to them?," he remarked in early 1977 (*Los Angeles Herald-Examiner*, February 11, 1977). He indicated that he regarded maintaining a dialogue as appropriate to "break down barriers between countries" and contrasted this approach favorably with an alternative posture of "intellectual isolation" (*New York Times*, May 22, 1977). He pressed this point in his lengthy letter in the London *Daily Telegraph* of June 13, 1977: "how are we to promote an interchange of ideas? How are we to penetrate the iron curtains that

exception if this had led to others labeling him "a supporter of the Brezhnev regime." (*Harvard Crimson* (Harvard University), November 1, 1976.)

[205] Instructional Dynamics Economics Cassette Tape 58 (October 4, 1970).

separate so many countries? How are we to bring hope and intellectual and moral stimulus to the brave people who are seeking to restore freedom in their own countries?"

A further dimension of Friedman's view of the matter of visiting dictatorships and of establishing an interchange of ideas was that he did not regard it as inappropriate to provide economic advice regarding those countries' economic policy if the prescribed economic measures were intended to improve the well-being of the populace. As the Communist countries were tied to an economic system that he believed locked them into low living standards, the scope for them to accept advice from Western economists (at least those who were not subscribers to Marxist economics) was limited.[206] Even so, Friedman welcomed the possibility that East bloc economists could be exposed to "economists who have a great deal of interest in the price system and free markets—in the capitalist system." Meeting "those who are favorable to a market economy" might ultimately encourage economic liberalization in those countries, he believed (Instructional Dynamics Economics Cassette Tape 58, October 4, 1970).

Friedman therefore shared the widespread view that academic contacts with countries that had oppressive governments could help the process of political liberalization in those countries, as well as the fairly widely held view that improving the living standards of undemocratic countries was a desirable objective. But he also subscribed to what he called a "special case" of the latter position (*Chicago Maroon*, October 3, 1975*a*) in believing that, over time, economic liberalization would be a democratizing force while simultaneously improving living standards.

This position, which underlay his statement that "economic improvement would contribute both to the well-being of the ordinary people and to the chance of movement toward a politically free society" (*Daily Telegraph* (London), June 13, 1977), will be examined further shortly.

[206] With respect to the issue of whether it was *desirable* to encourage economic advance in the Soviet bloc, the Western world's governments did not have a uniform and consistent view over time. It would probably be accurate to suggest that a concerted attempt to use either trade sanctions or restrictions on access to Western funds was not really attempted by the United States over most of the 1950s and 1960s, that its Western European allies were generally disinclined to take such measures, and that there also existed a sizable body of thought across the West (both within and outside Western governments) that held that improvements in Soviet households' living standards might help ease East-West tensions by inclining the USSR to become less expansionist and less fervent about world revolution. Friedman's own position on these issues was more consistent than official U.S. government policy, in the sense that he was not enthusiastic about trade sanctions and, when, in 1972, official U.S. policy became one of overtly encouraging trade with the USSR, he supported such trade but not on non-commercial terms. See the discussion below titled "Trade Credits and the Soviet Union" for a detailed analysis.

Friedman's objection to the focus on himself

The lengthy defenses—such as the mid-1977 example just quoted—that Friedman felt the need to produce bore testimony to the extent to which media coverage was linking himself and current Chilean economic policy. The impression of a major, continuous personal contribution by himself that emerged from many accounts was a source of continual frustration to Friedman. He would complain from 1976 onward that his critics were erroneously ascribing to him an ongoing and major involvement in Chilean economic policy: "people are saying that from my office in Chicago… I am guiding the Chilean economy," he remarked during his *Meet the Press* appearance (October 24, 1976, NBC, p. 3 of transcript).[207] Friedman made similar comments on many other occasions in subsequent years—often including in these remarks the sarcastic remark that he presumably conducted such guidance by extrasensory perception, as he was not in phone contact with Chilean government officials.[208] Shortly after his relocation to California, he declared emphatically that he was not going to accept the premise of what was being said about him. "I'm not going to take any responsibility for policies of the junta." (*Stanford Daily* (Stanford University), January 31, 1977, p. 1.)

Another major feature of Friedman's reaction—though one that he spoke about publicly to a much lesser degree at the time—was his unhappiness at the fact that the perception of a general University of Chicago/Chile link was centered on him—when other department members (most notably, Harberger) had actually been far more immersed in the study of Chile and in various discussions over the years of Chilean economic policy than he had been.[209] This frustration found expression in Friedman's 1998 memoir account, in which he indicated that his own celebrity had led to the focus of protests being put on himself, rather than on Harberger. Harberger did not disagree with this assessment, although he added that "I had my share of demonstrations" to face (Arnold Harberger, interview, April 12, 2013).

---

[207] Earlier, he had remarked at one of the protest-interrupted organizations: "I am not an expert on Chile. I do not get daily reports from anyone," adding sarcastically, "except the Spartacus Youth League" (the group that was regularly protesting against him in the University of Chicago area) (*Daily Northwestern* (Northwestern University, Illinois), March 1, 1976).

[208] See, for example, Friedman (1977j, p. 7), *Reason* magazine (August 1977, p. 26), and *The Times* (London), August 15, 1978, as well as in his in retrospectives on the 1970s in *Jerusalem Post*, November 6, 1987, and *Forbes*, August 17, 1992 (p. 42).

[209] Friedman and Friedman (1998, p. 403). This was a widespread assessment, and Rachel McCulloch observing (interview, October 3, 2013) with regard to Chile: "He [Harberger] was very involved. Whereas Friedman was marginally involved, I would say." See also McCloskey (2003).

Harberger, as indicated above, defended Friedman in a number of interviews and writings that appeared in the U.S. press in 1975 and 1976. As also noted previously, he did so in part by making the point that Friedman was not involved in running the University of Chicago side of the exchange program that had led to there being many Chilean economics graduates.

Another friend of Friedman's who defended him in the press was the nationally syndicated conservative columnist William F. Buckley, Jr., with whom Friedman had been on warm terms since the 1960s. In Buckley—whose defense of Friedman appeared in a column in December 1977, by which time Chile-related anti-Friedman demonstrations had become well established as a routine occurrence—Friedman had a high-profile supporter, but not one who was likely to change the views of many of Friedman's critics.[210]

Friedman and Buckley were both part of generally Republican-party favoring circles, but, as Friedman once noted, Buckley in the 1950s had come to prominence "in a different corner" of those circles from his own libertarian and free-market corner (*Reason* magazine, June 1995, p. 37). Buckley had, particularly in the 1950s and 1960s, taken a hardline conservative-Republican and strongly anti-Communist viewpoint, rather than an outlook founded on adherence to economic liberalism and older traditions of political liberalism. In domestic policy, Buckley had over the years defended illiberal arrangements imposed, nationally or within U.S. states, by the majority on the rest of the population: notably, he had coauthored a book praising Senator Joseph McCarthy late in the era of McCarthyism (see Buckley and Bozell, 1954) and had also opposed many of the civil-rights steps taken by the three branches of the federal government from 1954 to 1964. In foreign policy, Buckley had been an advocate of a U.S.-led toppling of Fidel Castro in Cuba and had opposed Nixon's bridge-building with China (*Record American* (Boston), February 25, 1972, p. 2).

Although Buckley would subsequently repudiate many of these positions, the fact that he had once held them did not situate him well to defend Friedman on liberty-related issues and on Chile. Consequently, Buckley's suggestion that it was "enraging to think that someone as tenderly concerned about human rights as Milton Friedman" should be characterized as favoring political oppression (*The Jersey Journal* (Jersey City, New Jersey), December 6, 1977)—while a suggestion that had merit in itself—was likely undercut by Buckley's own record of having taken what even he, in retrospect, recognized as illiberal and narrow-minded perspectives on numerous

[210] In a previous column, Buckley had quoted Friedman's *Chicago Maroon*/*Wall Street Journal* published letter regarding his Chile trip (*Milwaukee Sentinel* (Wisconsin), December 2, 1975).

key national and global issues.

Friedman's views on inflation and the controversy

In the mid-1980s, an interviewer suggested to Friedman: "There was a great deal of criticism, principally by Anthony Lewis in the *New York Times*, when you went down there [to Chile]. He asked whether you had any compunction about trying to prop up such a bloody regime." (*California* magazine, October 1984, p. 78.)

Although Lewis was certainly a key voice finding fault with Friedman with regard to Chile, his criticism was not, in fact, one that maintained that the policies that Friedman recommended would prop up the regime. The criticism that being part of the process of facilitating economic reforms would, in the case of a dictatorship, strengthen a country's economy and thereby bolster the government' standing—in turn possibly delaying the achievement of democracy—has certainly been advanced on the matter of having dialogues with dictatorial regimes, and so it figures into the ethical considerations concerning such dialogues.[211] But it did not correspond to Lewis' position. What Lewis advanced was, instead, a different criticism. Lewis' discussion (*New York Times*, October 2, 1975) was strongly predicated on the notion that Chile's, and any, economy would be permanently worsened by the kinds of policies that were associated with Friedman's name.

More specifically: Although Lewis' coverage of economic policy measures and of Friedman in his column were brief, they relayed a view that (*i*) that Friedman was idiosyncratic among economists in believing that the measures that he recommended against inflation would work, (*ii*) that they would not work and would, instead, produce permanent economic slump alongside continued high inflation, and (*iii*) that these measures of the kind that Friedman recommended, with respect both to demand restriction and to increasing the role of market forces, would not be acceptable in a democracy and no were inextricably tied to politically repressive regimes like Chile's. Each of these three items will be considered in turn.

With regard to Friedman's analysis of inflation, he had made major strides in getting acceptance of it in the U.S. economics profession by the mid-1970s. His focus on a monetary diagnosis and cure for inflation was, therefore, no longer idiosyncratic. The distinction between Friedman and

[211] For example, it is in this context that Ruger (2011, p. 57) discusses Friedman going to Chile in 1975.

the U.S. economics mainstream on the analysis of inflation had narrowed very considerably and would continue to do so over the late 1970s. "Twenty years ago, when I was at Yale, Milton Friedman was considered a crackpot," Richard Rosett, dean of the University of Chicago's business school, noted after Friedman won the Nobel award (*Business Week*, November 1, 1976, p. 75). During the 1950s, Friedman's then-widely-shunned viewpoint on monetary policy's importance had been a key factor in producing this perception. "He once was a small voice in the profession," noted a report on Friedman's activities on the day of the announcement of his Nobel award. The article quoted Friedman saying in a speaking appearance in Flint, Michigan, that day that "there has been a very substantial change in monetary thought in the last 20 years" and that "some of the more extreme views in Keynesian analysis are dead." In contrast, Friedman noted, "Many ideas I have fostered are being used." (*The Flint Journal* (Michigan), October 15, 1976.)

On the matter of inflation being a monetary phenomenon, this process of acceptance continued beyond 1976 and became consolidated, and, very late in his life, Friedman replied, "I think that is a correct statement," when presented with a quotation from Bernanke (2004a, p. 5) stating that Friedman's views had become embedded in modern monetary analysis (*The Charlie Rose Show*, PBS, December 26, 2005, p. 21 of transcript).

With regard to achieving disinflation, Friedman insisted that, as an analytical and empirical proposition, "It's not what I advocate that matters—there is only one way to do it." (*St. Louis Globe-Democrat*, December 16, 1977.) The original revival of monetary policy in the 1950s, Friedman observed in testimony in 1959, had reflected a recognition that monetary policy needed to be deployed: "*No country succeeded in stemming inflation without adopting measures that made it possible to restrain the growth in the stock of money*."[212] The ranking of monetary policy and fiscal policy as aggregate demand tools had also changed by the 1970s. Hart and Brown (1951, p. 98) had stated—reflecting a view to which Friedman himself had once himself previously subscribed: "The personal income tax is one of the strongest weapons in the anti-inflation arsenal." A quarter century later, partly reflecting the influence of Friedman's research as well as experiences like the 1968 tax increase, this view had much less acceptance in the U.S. economics profession.

After the monetary policy/fiscal policy debate had receded, the monetary view of inflation did

---

[212] Testimony of May 25, 1959, in Joint Economic Committee, U.S. Congress (1959a, p. 607).

not immediately prevail in the United States. Instead, in the country's economic debates over the 1970s, it still had to contend, particularly in policy circles, with cost-push views. But Friedman's view that inflation was a monetary phenomenon would predominate in the United States by the end of the decade.

In higher-inflation countries such as many in Latin America, it had, likewise, become evident that the actions that were effective against inflation involved measures that were designed to restrict aggregate demand and that entailed monetary restraint. Mikesell (1967, p. 3) observed: "The economic indicator which is most closely correlated with the rate of inflation in Latin America is the rate of increase in the money supply… This applies particularly to countries with high rates of inflation such as Argentina, Brazil, Chile, and Uruguay." Correspondingly, with regard to how to proceed with disinflation, when the University of Chicago's Tom Davis referred in Congressional testimony in May 1962 to "the anti-inflationary programs that we have encouraged Latin American governments to espouse," he was referring to stabilization packages—often associated with and recommended by the IMF—that involved demand restriction and that proposed to reduce monetary expansion substantially.[213]

The monetary nature of inflation across economies underlay Friedman's statement (*Daily Telegraph* (London), June 13, 1977): "The diagnosis is the same everywhere and so is the treatment." Of course, with regard to Chile, Friedman's recommended treatment, while entailing monetary restriction, did differ from that he recommended for the United States, because it involved massive initial steps down in nominal aggregate demand growth, as distinct from the gradualist approach that he recommended in instances of double-digit inflation rates. This drastic approach to disinflation was what he and others called "shock treatment"—a term that was not, as *Business Week* (January 12, 1976, p. 71) contended, originated by Friedman but instead was already prevalent in discussions of prior actual, or contemplated, Latin American economic-stabilization packages (see, for example, Krieger, 1974, p. 45).

In later years, this drastic approach to disinflation became known instead as "cold turkey," and it was analyzed in a textbook context by Dornbusch and Fischer (1987, pp. 525−527). Dornbusch and Fischer noted several analytical reasons why cold-turkey policies, rather than gradualism, might be appropriate in response to triple-digit (or still higher) inflation rates. This reasoning, which had featured in Friedman's discussions in the 1970s—as well as others' analyses that had

---

[213] Testimony of May 10, 1962, in Joint Economic Committee, U.S. Congress (1962, p. 28).

appeared in the 1960s of the various stabilization packages in Latin America and elsewhere—had included the consideration that the experience of very high inflation had lowered both the length of nominal price contracts and the size of holdings of money balances and so made a more rapid restriction of aggregate demand less costly in terms of short-term loss of output and employment than it would be in an economy less accustomed to inflation. An additional, but related, consideration in favor of a large initial restriction of aggregate demand was what Dornbusch and Fischer (1987, p. 526) called a "credibility bonus." This factor—also embedded in Friedman's reasoning but highlighted especially in Sargent's (1982) analysis of several very large-scale pre-1950 disinflations and economic-stabilization packages—involved the possibility that, in extreme-inflation conditions, a very major change in policy stance toward restriction could lower inflation expectations quite quickly but a gradualist policy—the public's confidence in which might be undermined by a belief that a policy *U*-turn would occur in a future year—might not.[214]

Friedman's recommendations concerning Chile also differed from those he applied to the United States in the sense that he believed that Chile needed to engage in simultaneous major monetary and fiscal restrictions. Even in the case of the United States, Friedman believed that it was desirable that growth in federal government spending be restricted alongside monetary growth as part of a disinflation program. But he believed that monetary restraint would be able to generate U.S. disinflation even if the federal government had an unchanged fiscal policy stance.[215] With regard to Chile, however, he believed that this separation of monetary policy and fiscal policy was not possible. He maintained, as elsewhere, that the "one thing that's essential" to get inflation down in Chile was a reduction in monetary growth (*Stanford Daily* (Stanford University), January 31, 1977). But Friedman stressed—both in his public discussions and in his letter to Pinochet in April 1975—that money creation was closely linked to fiscal policy in Chile because the budget deficit was so large and was being monetized.[216] Accordingly, he believed that disinflation needed to include sharp fiscal restriction—in Friedman's recommendation,

[214] Sargent (1982) also strongly underlined the point that the hyperinflations that he studied had typically been cured by drastic simultaneous monetary and fiscal restriction. In so doing, he provided examples that contradicted the later presumption underlying *Business Week* (January 12, 1976, p. 70) and other commentaries that such policies were new and that the feasibility of their implementation was founded on their being a repressive political regime in force.
[215] For discussion of his views in this connection, see, in particular, Nelson (2020a, Chapters 7 and 10) and Chapters 6, 10, and 11 of the present book.
[216] See also Caputo and Saravia (2021, p. 214) on the relevant Chilean fiscal and monetary data for this period.

major government spending cuts.[217]

The view that a major monetary and fiscal restriction was needed to get inflation down in very high-inflation condition was more widely accepted among economists than the controversy over Friedman and Chile's economic policy might have suggested. For example, Tom Davis, Friedman's one-time colleague and now at Cornell University, was a critic of the 1975 Chile economic-policy package but indicated that he did favor budget deficit reduction, his proposed means of doing so being tax increases rather than spending cuts (*Business Week*, January 12, 1976, p. 71).[218] And Dornbusch and Fischer (1987, p. 530), in noting what experience showed was the best way "to reduce the inflation rate from several hundred percent per year to low double-digit per annum figures," suggested that, in contrast to traditional cold-turkey policies, it was worthwhile to include "wage and price controls as part of a complete package," as this feature could expedite the adjustment of inflation.[219] But they themselves also stressed the necessary condition for disinflation that "*the accompanying aggregate demand measures are taken*" (Dornbusch and Fischer, 1987, p. 530, emphasis in original).[220]

All told, with regard to what has been designated above part (*i*) of Lewis' 1975 critique, it is appropriate to conclude that Friedman's position that inflation was a monetary phenomenon and that disinflation required major monetary restriction was *not* a perspective special to him but had become, certainly over the later 1970s and beyond, a mainstream one.

Lewis' critique extended to the real implications of monetary and fiscal policy restriction. As indicated in item (*ii*) in the list above, Lewis' discussion implied that this restriction would create permanently high unemployment, along with a permanently deep negative output gap.[221]

---

[217] For example, in his letter to Pinochet of April 21, 1975, he wrote (Friedman and Friedman, 1998, p. 592): "A cut in the fiscal deficit is the indispensable prerequisite for ending inflation." For examples of his corresponding public remarks, see Friedman (1977i, p. 46) (also in Friedman [1978b, p. 71; 1991a, p. 152]).
[218] The study of postwar experience of several advanced economies by Alesina, Favero, and Giavazzi (2019) found that, empirically, fiscal-consolidation measures that are centered on reducing government outlays involve fewer real output costs than those that rely heavily on tax increases.
[219] Friedman himself recognized (in discussing lower-inflation situations) the analytical merit of controls in these circumstances but doubted their having the intended beneficial effects. See Nelson (2020b, Chapter 15).
[220] Similarly, in discussing the 1980s "heterodox" policies of disinflation that Dornbusch and Fischer (1987) were considering, Diaz and Tercero (1988, p. 385) remarked that: "as the proponents of these policies have repeatedly emphasized, except in rather extreme cases the heterodox part of the program cannot substitute for the 'fundamental' adjustments (the short-run and structural reduction of the deficit)."
[221] He correctly implied that Friedman took the opposite view— but incorrectly implied that Friedman believed that an output recovery would occur through the channel of shifting income to businesses (*New York Times*, October 2, 1975).

Although Lewis was applying this argument to the case of Chile, it was one that would be applied to smaller-scale applications of monetary restriction to reduce inflation. For example, Nigel Lawson would recall that the restriction of aggregate demand in the first term of the Thatcher Government (in whose economic team Lawson had served) had led not only to recession but also to critiques that "implied that the recession would go on forever."[222]

When discussing the process of reducing inflation in any country, including Chile, Friedman consistently indicated that disinflations would involve a short-term decline in real output.[223] But he also believed that, once inflation was brought down significantly, noninflationary recovery (including a period when the output gap was closing while inflation continued to fall) and, ultimately, restoration of full employment could both occur. Consistent with the wide acceptance of the natural rate hypothesis, this view also became part of the U.S. economic mainstream. Bosworth, Dornbusch, and Labán (1994, p. 1) stated that, from 1976 in Chile, "recession was followed by several years of strong recovery" but that this development generated undue claims of success, as it was followed by the economic crash that started taking place in 1981−1982. Their conclusion was correct insofar as the pre-1982 economic expansion was misperceived as signifying a definite upturn in long-term productivity growth. But, even if it did not reflect a higher trend rate of potential output growth, the actual output growth seen in the pre-1982 period was consistent with a process of post-disinflation recovery of the kind predicted by the natural rate hypothesis. And as both Dornbusch's and Friedman's retrospectives concurred, the post-1981 economic crash largely reflected the repercussions of a 1979 policy change in Chile, when the government fixed the exchange rate and so imposed an additional and severe monetary restriction in the early 1980s.[224]

It is therefore apparent that what was called above Lewis' proposition (*ii*), which was a claim to the effect that demand restriction necessarily imposes permanently high unemployment, was one that ran against mainstream U.S. economic opinion by the late 1970s and that continued to do so in later years.

Item (*iii*) of the propositions embedded in Lewis' column—the contention that it was only in the presence of political oppression that the monetary-restriction and free-market policies that

---

[222] Lawson (1991, p. 630). Lawson was, of course, using the term "recession" loosely to mean a negative output gap.

[223] He expressed this judgment specifically with regard to Chile on a number of occasions, including in his April 1975 letter to Pinochet (see Friedman and Friedman, 1998, p. 592).

[224] See Chapter 13 below.

Friedman recommended could proceed—was echoed in his newspaper about six months after the column. A news report (*New York Times*, March 21, 1976) on Chile's economic policy (both its demand-restriction and free-market aspects) took this proposition so much for granted that it treated it as a factual, rather than a disputed and contentious, point that with regard to "Mr. Friedman's theories… their application requires the continuation of a repressive political system." But it was a proposition that Friedman vigorously disputed.

In arguing against this proposition, Friedman stressed that, with respect to the issue of monetary restriction, countries, whether democracies or dictatorships, had invariably found over history that monetary restraint was the only effective means of getting inflation down.[225] On the issue of economic liberalization, too, he dissented strongly from what he would call "the myth that only an authoritarian regime can successfully implement a free-market policy" (*Newsweek*, January 25, 1982). In terms of recent examples, Friedman, in 1977, pointed out that, in the democratic world, some advanced economies like the United Kingdom and Italy were reducing the role of the public sector in the economy.[226] In providing a longer-term perspective on the same topic, he had earlier cited the United Kingdom in the nineteenth century as a democracy that had moved from a heavily state-controlled economy to one characterized by considerable economic liberalization (Instructional Dynamics Economics Cassette Tape 25, May 25, 1969).[227]

Friedman's position on Chile and the economic freedom/democracy link

As well as disputing the link between repression and his policy recommendations that his critics postulated, Friedman went further in arguing that the economic policies that he advocated would help pave the way for the restoration of democracy in Chile.

---

[225] See, for example, his discussion in *New York Times*, May 22, 1977, as well as the discussion above.
[226] Friedman (1977k, p. 493).
[227] Peck (2011, p. xliv) stated that, in a 2000 interview, Friedman "sputtered, 'No, no, no, not at all. After all, Great Britain put Chicago theory in[to] practice in the nineteenth century […]'" (*Commanding Heights*, PBS website, 2000, p. 15; also in Ebenstein, 2012, p. 249) when it was put to him that Chile in the Pinochet era had been the first country to do this. The *Oxford English Dictionary* online (oed.com) defines "sputter" as "to speak or talk hastily and confusedly or disjointedly" and the similar word "splutter" as "to utter hastily or indistinctly" or "to talk or speak hastily and confusedly." Other than being a rapid-fire response, Friedman's 2000 answer did not fit these descriptions. "No, no, no, not at all" was standard Friedman speech. And the substance of Friedman's answer in 2000 concerning the nineteenth-century United Kingdom and the United States as examples of market liberalization was a repeat of points that he had made well before the junta came to power in Chile. In the aforementioned Instructional Dynamics Economics Cassette Tape 25 (May 25, 1969), he had cited the United Kingdom in the nineteenth century as providing "the most dramatic example in history" of a reduction in the degree of state intervention in the economy. (See also the discussion in the previous chapter.) Consequently, it seems inappropriate to judge that Friedman's answer in the documentary interview was the hasty, confused response that would justify characterizing it as sputtering.

In making this case, Friedman made numerous interventions, particularly in 1975 and 1976, on the link between economic freedom and democracy, including specifically in the context of Chile. As already indicated, he talked little publicly about the Allende's government during its 1970–1973 tenure. But he did refer on numerous occasions after the government's fall. In these discussions, Friedman characterized the situation in Chile in 1973 as poised to lead to either Communist dictatorship or authoritarian dictatorship. To a limited degree, his accounts referred to political steps that he thought Allende had taken that were in the direction of stifling political dissent: "Allende had, in large part, destroyed democracy," he remarked in one early commentary (Instructional Dynamics Economics Cassette Tape 166, March 1975). Suggestions of this kind were prevalent among critics of Allende within the U.S. government and in the U.S. and U.K. press.[228] But Friedman himself did not press this point strongly and, as indicated above, he acknowledged that the move to a dictatorial regime that did not tolerate dissent resulted from the Pinochet coup and did not occur under Allende.

Friedman instead concentrated on the economic conditions prevailing in Chile by September 1973 and suggested that these were liable to generate a situation of revolution and dictatorship. In so doing, he made a twofold economic critique of the Allende policies. First and more familiar was the very high rate of inflation: "If we really do have unrestrained inflation, we shall not end up with a democratic system," he observed, articulating what he believed was a general principle that applied across countries, including the United States (*Reason* magazine, June 1975, p. 93).[229]

The suggestion that super-high inflation rates could generate unrest that ended democracy was not special to Friedman. As detailed in the first part of this chapter, discussions of the political turmoil associated with inflation were prominent in the world media in the mid-1970s, and the scenarios considered included, as an extreme case, the possibility of coups.[230] One example of

---

[228] For example, internal U.S. government memoranda during the Allende years referred to alleged instances in which the Chilean government was limiting the scope for political dissent (see McElveen and Siekmeier, 2014, pp. 543, 549). As far as restrictions on the press were concerned, the judgment of Senate staff member Gregory F. Treverton suggested some cases of pressure but concluded: "Freedom of the press continued in Chile until the military coup in 1973." (Testimony of December 4, 1975, in Select Committee To Study Governmental Operations With Respect to Intelligence Activities, U.S. Senate, 1976, p. 16.)

[229] Of course, he made many other comments to this effect: see Nelson (2009b, pp. 492–493; 2020a, Chapter 7).

[230] It had, of course, already featured heavily in discussions of Latin America even in the 1950s and 1960s, owing to the severe inflation experiences seen in the region over those decades. For example, Mikesell (1967, p. 29) observed: "It is not simply a coincidence that severe political crises, often resulting in the overthrow of governments, have occurred in periods of extreme price instability, although I am not suggesting that inflation provides the principal explanation for Latin American revolutions or dictatorships."

such analyses was a piece in *Time* magazine (April 8, 1974, p. 72) which stated: "The ultimate threat is that inflation will eventually weaken confidence in democratic governments and prepare the way for sharp, violent shifts to the radical right or left."

Second, Friedman believed that the expansion of the public sector's role under Allende had been proceeding in a manner that meant that the likely next step would have not been consented to by the citizens and that a Communist dictatorship would have been imposed to continue the expansion of the government's role. Consequently, he referred to "the Communist regime Allende was seeking" (*Chicago Maroon*, October 3, 1975*a*) and the "Communist totalitarianism that was in store for Chile" (*Daily Telegraph* (London), June 13, 1977). Similarly, in December 1975, Friedman suggested that the Allende government was "clearly seeking to turn Chile into a Communist dictatorship" and that Chile reached "the tipping point at which the willingness of the public to put up with increasing involvement in their own lives was exceeded." He considered that the situation was one in which Chile was poised to have either a "left-wing dictatorship" or "a counterrevolution with the military taking over." [231] It was, of course, the latter that occurred, with the Pinochet coup ending democracy in Chile.

In Friedman's controversial interpretation, therefore, the Allende Government's moves to give the public sector a large role had helped produce conditions, including an attempt at preempting private-sector activity on such a scale that it could be enforced only through coercion, that some loss of democracy was the next step, either in the form of a government crackdown or the forcible overthrow of the government.[232] "Chile had a choice of Communism under Allende or a military junta," he suggested (*Los Angeles Herald-Examiner*, February 11, 1977).[233] "There's no

[231] Friedman (1976j, p. 563; 1976k, p. 31517). Some form of the notion that a revolutionary situation that threatened democracy was created by developments through 1973 was expressed by many critics of the Allende government in the U.K. and U.S. press. It was also voiced by some other economists, although they did not necessarily subscribe wholly to Friedman's view of the process through which this occurred. For example, Velasco (1994, p. 397) stated: "If it was the left that delivered the lethal blow to Chile's traditional political-economic arrangements, it was the military government that buried the system for good."

[232] Griffiths (1982, pp. 68–69) reached conclusions about the implications of the growth of Chile's public sector in 1970–1973 that were fairly similar to Friedman's.

[233] Friedman's hypothesis that political freedom became more precarious as the share of public spending in output rose had appeared in his work on foreign aid in the 1950s (see Nelson, 2023). It acquired new prominence and controversy in 1975–1977 when he applied it to the cases of Chile and the United Kingdom (see Nelson, 2009b, pp. 492–494, as well as the previous chapter).

With regard to Chile specifically, Friedman implied that the alleged tipping point at which the share was high enough to undermine political cohesion may be 35 to 40 percent (*The Money Programme*, BBC2, December 10, 1976, p. 12 of transcript). This range left some ambiguity about whether he thought that the tipping point was reached in the year of the coup or, instead, earlier. In Friedman (1977g, p. 90), Friedman contended that the rise in the public sector's role prior to Allende had created economic problems, including inflation, that led to Allende's

doubt that Allende brought the coup on himself, but not necessarily through his inflationary policies," he later remarked. "It was because he was trying to turn the country into a standard Communist totalitarian state." (*Boston Globe*, April 3, 1983, p. 25.)

Friedman was emphatic, from the launch of the public controversy over himself and Chile, in advancing the argument that the economic policies that he recommended would be helpful in getting back to democracy. On the macroeconomic side, he felt that stabilization of the economy would make it more likely that Chile would "get rid of the junta" and return to being a democratic state (*Stanford Daily* (Stanford University), January 31, 1977, p. 1). Reductions in the extent of the country's economic problems would, he assessed, produce an atmosphere in which the junta would be under great pressure to relinquish power. "If there is a ghost of a chance of democracy being restored in Chile, it will depend on a considerable improvement in the state of their economy," he argued (*Business Week*, November 1, 1976, p. 75).

On the microeconomic or structure-of-economy side, Friedman expounded a position that was more special to himself, as it reflected his view of the economic-freedom/political-freedom linkage. He had long acknowledged that a substantial degree of economic freedom had existed in some very far from politically free counties (*Wall Street Journal*, April 30, 1962). With reference specifically to Latin American countries, Friedman granted that they had generated examples of a considerable role for private-sector economic activity coexisting with the suppression of political freedom (*Reason* magazine, December 1974, p. 12). He was therefore acknowledging that economic freedom did not have an instantaneous relationship with political freedom. But he believed that there was a contrast among dictatorships in important respects in their reversibility. As he repeatedly noted in his defenses of his Chile trip—and speaking, of course, before the fall of the East bloc in 1989−1991—the record suggested that Communist dictatorships had never given way to democracy (*Chicago Maroon*, October 3, 1975*a*; *Daily Telegraph* (London), June 13, 1977; *Newsweek*, January 12, 1981). In contrast, he observed, "Some juntas have led to a democratic form of government." (*Los Angeles Herald-Examiner*,

---

election, and that both the loss of freedom under the junta had been preceded by reductions in freedom under Allende. For the most part, however, he judged the tipping point as having been reached when the public-sector share attained 40 percent. For example, he stated (*Newsday* (BBC television program), BBC2, November 9, 1976, p. 2 of transcript): "When government spending in Chile reached about 40 percent of the [national] income, that was the turning point. You had first the Allende threat and then the military takeover—a loss of freedom, tragic loss of freedom." Friedman also cited the figure of 40 percent as the tipping point for Chile in *Milton Friedman Speaks*, Episode 5, "What Is Wrong With the Welfare State?," taped February 23, 1978 (p. 25 of transcript). This share was reached in 1973, when the share of government spending to GDP was 44.7 percent (Edwards and Edwards, 1987, Table 2–2, p. 32).

February 11, 1977.) From a starting point of a military junta rather than a Communist dictatorship, there was, he perceived, "some chance of reversing things" and moving from such regimes back to democracy: "It might take five, ten, fifteen years to reverse, but it would be possible. The Greek Colonels got thrown out, after all." (*Daily Mail* (London), September 30, 1976.)

With regard specifically to economic policy, Friedman contended that permitting a large role for private economic activity would create forces that would undermine the rule of the Pinochet junta. Although, as he noted, military dictatorships often permitted private-sector economic activity, he believed it was common for them to endorse heavy government intervention in the economy and move to a centrally controlled economy over time. As, in Friedman's assessment, central economic control could not be extended on a truly large scale in a democracy, such moves in the direction of economic interventionism tended to make the dictatorship permanent. Correspondingly, in his analysis, Chile's junta could not coexist indefinitely with a free market economy: it would either have to give up its rule or centralize economic control (*Newsweek*, January 25, 1982).

On this basis, Friedman believed that economic liberalization would be a force making for political liberalization. He believed that the policies he favored would "promote[,] not retard[,] a movement toward greater liberalism and freedom" (*Chicago Maroon*, October 3, 1975*a*) and increase the "chance of movement toward a politically free society" (*Daily Telegraph* (London), June 13, 1977).

Dictatorships and the amount of permitted private-sector activity

Friedman's particular view that enhancements of economic freedom helped facilitate the process of political liberalization was, and remains, controversial. Unlike, for example, his propositions about inflation, it was not something on which he could invoke unambiguous, wide support across the economics profession.

Nevertheless, some of the building blocks of that view were empirical and historical propositions for which economic research over time did provide considerable evidence. For example, Friedman's position that military governments often showed inclinations to increase, rather than

decrease, state control of the economy was supportable by Latin American experience.[234] It was also undisputed that different dictatorships, even those outside Communist-run areas, had been associated with different attitudes to the use of market mechanisms and that a regime's attitude sometimes changed over time. There was, furthermore, considerable agreement among economists that reforms that allowed market mechanisms to operate to an increased extent had improved economic performance in countries, including in dictatorships. With regard to Spain, for example, General Franco had been dictator of that nation since 1936, but he changed economic policy notably in 1959, and de la Escosura, Rosés, and Sanz-Villarroya (2012, p. 45) reported their finding that "the 1959 Plan opened the way to a new institutional design that favored a free-market allocation of resources and allowed Spain to accelerate growth and catch up with Western Europe." They concluded: "Without the 1950s reforms and, especially, the 1959 Plan, per capita GDP would have been significantly lower in 1975 [when Franco died]."

December 1976 and afterward: an ongoing controversy

Friedman's week in Stockholm reached its culmination with his Nobel address of December 13, 1976, and he returned with Rose Friedman to the United States. Although he had complained about the tightly scheduled nature of his agenda in the Nobel Prize awards week, the resumption post-trip of Friedman's U.S. engagements underscored the fact that he had established a routine at home that involved its own hustle and bustle of near-continuous speaking engagements. Reflecting this situation, Friedman, having given his Nobel lecture on Monday, promptly moved from the international to the U.S. speaking circuit, and from economic-researcher mode to public-policy participant mode, by giving a talk at the Dupont Plaza Hotel in Miami on the evening of Wednesday, December 15, 1976, on "National Economic Policy and Financial Planning."

Looking back during this event on his just-completed week in Stockholm, Friedman optimistically attempted to cast the protest activity against himself as now being in the rear-view mirror: "I have never seen such a big mountain made over such a small molehill. I went to Chile a year and a half ago for six days under the auspices of a private Chilean foundation. I do not endorse the political actions of the junta, and going there implies no approval." (*Miami Herald*, December 16, 1976.)

[234] For example, Martinelli and Vega (2021, pp. 413–414) discuss the increase in economic intervention that occurred in Peru during the 1968–1975 military dictatorship.

During the following year, however, Friedman would be disabused of any perception that the controversy was fading away. The matter of himself and Chile continued to receive heavy press coverage—a fact reflected in his mid-1977 reference to the continuing "stream of comments in the media arising out of my visit to Chile" (*Daily Telegraph* (London), June 13, 1977). The year 1977 would also feature, at Friedman's public appearances, many more of what he had referred to as the "so-called protests" (*Stanford Daily* (Stanford University), January 31, 1977, p. 1). For example, an occasion when he made a lunch talk at the University of California, Berkeley, by the university's economics department, would see demonstrators disrupt the talk by heckling Friedman through the window of the presentation room, and a speech—one that was specifically concerned with the criticisms that he had received in connection with Chile—that Friedman gave at the Commonwealth Club of California (in San Francisco) involved thirty demonstrators confronting him outside the venue, giving out, to entering attendees, leaflets that accused Friedman of wrongdoing, and continuing their demonstration while Friedman spoke (*New York Times*, December 2, 1977).[235]

These particular protests, and others, took place in Friedman's new location, the Bay Area. But he also encountered demonstrations over this period when he left his new home city of San Francisco to fulfil scheduled speaking appearances in the rest of the country, and he faced further protests when he made trips abroad. One confrontation took place when, at the invitation of Niels Thygesen, Friedman visited Copenhagen in mid-1977. Thygesen recalled that "there was, in fact, a demonstration that interrupted our meeting with him at the Danish Economic Association." Thygesen recalled that the demonstration that Friedman "handled, in a way, quite nicely," only to give up—"he stopped his presentation after he had been interrupted a couple of times. We couldn't get him to resume, even though those who had disturbed the proceedings were removed." Thygesen observed that Friedman was simultaneously put off his stride by, and resigned to, incidents like the interruption. "He took it very calmly. He said, 'I'd like to discuss this' [that is, he told his hosts that he would have wished to continue the economic talk] but then he just stopped." (Niels Thygesen, interview, February 10, 2015.)

In his memoirs, Friedman suggested that the controversy, and in particular the protests, had faded by about 1981, before Chile's economic crash of the early and mid-1980s gave new impetus to criticism of the country's economic policy.[236] But that does not seem to be how Friedman saw things at the end of 1980, because he wrote a *Newsweek* column (in the issue of

[235] Friedman's remarks at the event were published as Friedman (1977k).
[236] Friedman and Friedman (1998, p. 405).

January 12, 1981) about the amount of demonstrations that he had faced and predicted that he would encounter more.

In 1990, Chile's junta was finally replaced by a democratic government. Official investigations into the junta's record of abuses reached a conservative estimate of 2095 deaths and 1102 "disappearances" as having been due to the Pinochet regime (Schliesser, 2010, p. 195). As already indicated, Friedman continued across the junta and post-junta periods to condemn the junta's record of repression and to insist that it was possible to take this stand while having favorable things to say about Chile's economic policies and performance.[237] During the 1990s, there was much favorable world commentary on Chile's macroeconomic record, and in early 1991 Friedman ventured to claim that Chile's return to democracy and its unfolding economic outcomes had led to a falling-away of negative verdicts on himself on the subject of Chile (*Wall Street Journal*, January 8, 1991).

In spite of generalizations like this, questions to Friedman on the matter continued, including at a November 1991 speaking event in Washington, D.C., when he defended his role and stated: "Chile was a case in which a military regime headed by Pinochet was willing to switch the organization of the economy from a 'top-down' to [a] 'bottom-up' performance and, in that process, a group of people who had been trained at the University of Chicago in the Department of Economics, who came to be called 'the Chicago Boys,' played a major role in designing and implementing the *economic* reforms. The real miracle in Chile was not that those economic reforms work so well. Chile is, by all odds, the best success story in Latin America today. The real miracle is not that those economic arrangements worked so well—because [after all] that's what Adam Smith [already] said. The real miracle is that a military junta was willing to let 'em do it. See, as I said to begin with, the principle of the military is 'from the top down,' [while] the principle of the market is 'from the bottom up.' Now, it's a real miracle that a military group was willing to let a bottom-up approach [to the economy] take over… I will say that that process led to a situation in which you were able to get an election which ended the military junta, and you now have a democratic government. You cannot cite any similar examples from the world of entirely socialist states. So I was not an adviser to Pinochet, I was not an adviser to the Chilean government, but I am more than willing to share in the credit for the extraordinary job

[237] See, for example, the Friedman (1991b) quotation given above.

that our students did down there." (CSPAN, November 16, 1991.)[238]

The period from 1975 to the early 1980s was likely that of peak protest against Friedman. But, as Friedman's long answer in 1991 answered, the controversy over himself and Pinochet-era Chile never really went away. Friedman was still taking questions on the issue as part of one of his final interviews in 2006 (*Rutgers* magazine, Fall 2006).[239]

As Friedman well understood, his standing was materially damaged, with his image, nationally and internationally, adversely affected due to members of the U.S. and global publics seeing, and in large numbers partially or fully accepting, the criticisms made about his trip to Chile and the related charges against him. Marc Nerlove observed of his former teacher and 1969−1974 colleague: "In any case, he was a lovely man in many ways. He was, unfortunately, tarred by some of his associations in later years." (Marc Nerlove, interview, September 26, 2013.)[240]

During the period of maximum protest activity against him and of media criticism—both of which were often very angry—Friedman himself responded angrily. With regard to the protesters in particular, he, in essence, rose to the bait: Especially in 1977, Friedman provided visceral, and eminently quotable, public comments about what he regarded as an unjust attempt to make him a pariah. When protesters attended and disrupted a public talk that Friedman gave at Cornell University in September 1977, Friedman referred to them *inter alia* as "these ruffians" (*Ithaca Journal* (New York), September 28, 1977).[241] Late in the year, he gave a newspaper interview, conducted at his and Rose Friedman's new San Francisco home, specifically on the topics of the Chile-related interruptions of his public speaking engagements and of the related controversy regarding his 1975 trip. In the interview, he referred to the protesters as "bums" and

[238] Friedman's statement that no fully socialist state had ever transitioned to democracy—a stock part of his discussions in the 1970s and 1980s—had, of course, been rendered obsolete by late 1991 by the prior two or three years' events.
[239] The specific example of this interview, appearing in the fall of 2006 (the period of Friedman's death) therefore provides an illustration of Applebaum's (2019, p. 268) observation that Friedman faced questions on the matter right through the rest of his life.
[240] Nerlove remarked of Chile: "I visited there in '74… [And] many of my former students, especially [one-time students] in my 'baby' [that is, introductory graduate University of Chicago] econometrics class, were in positions of great responsibility in that government… I certainly didn't seem to have gotten tarred by having gone there during that period… I learned what hyperinflation was really like in that visit." (Marc Nerlove, interview, September 26, 2013.)
[241] The event was taped for use in the planned *Milton Friedman Speaks* television series (discussed in the next chapter). Although the series was never completed and transmitted, the recording of the event (*Milton Friedman Speaks*, Episode 3, "Is Capitalism Humane?," taped September 27, 1977, released publicly as a videotape in 1980 and much later on DVD), although edited to remove the protesters' main interruption of Friedman's talk, clearly indicated that the protesters had had a marked effect on the course of the proceedings.

remarked of his encounters with the demonstrators: “Obviously, I don’t enjoy it. It’s a frightening experience to see these crazy kids, these kooks, with the madness on their faces.” (*New York Times*, December 2, 1977.)

Friedman’s interviewer recorded his demeanor as he made these sometimes pointed remarks as being calm. A noteworthy admission in the interview concerning the movement against him was Friedman’s matter-of-fact acknowledgment that the protesters had, to a degree, achieved their aim: they had wanted to stop him from making public appearances, and he had indeed cut down his speaking commitments. He conceded that, “if you’re going to be honest,” the conclusion was that it was not true that the demonstrations had not become a consideration in the planning of his schedule. “There is no doubt that if I know I’m going to face an episode like this, I’ll be more reluctant to accept an invitation to give a speech. More important, the people who offer invitations will be more reluctant to offer.” The protesters had succeeded in introducing into the consideration “a cost, both on the speaker and the host.” (*New York Times*, December 2, 1977.)

Over time, Friedman also became more outspoken about what he felt was the organized nature of the protest movement. In the *New York Times* interview just quoted, Friedman had also maintained that many of the protesters were “mindless puppets” and suggested that there was an underlying central force coordinating the protests. But he did not give voice to specific conjecture about what that force was.

In the 1990s and 2000s, however, Friedman was considerably more forthcoming about his suspicions on the matter, with one of his final interviewers summarizing his position as: “He’s also convinced that the protests were orchestrated by Communist propagandists in Moscow.” (*Rutgers* magazine, Fall 2006, p. 27.)[242] In a 2000 interview, Friedman suggested that, in the aftermath of the Pinochet overthrow of the 1970−1973 government, “The Communists… were going to discredit anybody who had anything to do with him. And, in that connection, I was subject to abuse, in the sense that there were large demonstrations against me at the Nobel ceremonies in Stockholm.”[243] In his late-1977 interview, he had cited as evidence of the orchestrated nature of the campaign the uniformity of the literature: “Demonstrators outside were the same kind of people carrying the same banners, and their leaflets were word for word the same as [at] the other [protest] places.” (*New York Times*, December 2, 1977.) In the same interview, he suggested that “the same kind of people” attended different demonstrations, and in

[242] See also Friedman and Friedman (1998, p. 402).
[243] *Commanding Heights*, PBS website, 2000, pp. 14−15 of transcript. Also printed in Ebenstein (2012, p. 249).

his memoirs he made the bold claim that he and Rose Friedman recognized "a few faces" that were the same in protests in the Greater Chicago area and at Cornell University and in the audiences during Friedman's 1975 lectures in Santiago.[244] In a later interview, he named the December 1976 Stockholm demonstrations and post-1976 protests outside the Friedmans' home in San Francisco as additional examples of occasions when he saw "the same faces" (*Rutgers* magazine, Fall 2006, p. 27).

Friedman's written replies to critics took for granted that he and they had a common aim of seeing Chile restored to being a "liberal democratic society" (*Chicago Maroon*, October 3, 1975*a*). His subsequent comments about the nature of the protests against him nevertheless clearly indicated, especially via the implication of USSR involvement, that he did not feel that this aim was shared by all protesters and by all the protest organizers.

But, with the abuses of the Pinochet regime widely documented from an early stage of its rule, there was bound to a be a critical mass of outcry in the Western world against the junta, even if the East bloc had stayed wholly uninvolved in the matter. It was also bound to be the case that, in Western opinion, there would be a considerable body of thought holding that the appropriate means of registering opposition to the Pinochet regime's infringements of human rights should include having academics eschew travel to Chile, and that their shunning of the regime should include having no contact with members of the Chilean government on the matter of economic policy. Consequently, Friedman was bound to face controversy as a consequence of agreeing to the trip to Chile and of then meeting Pinochet and other members of the junta regime, as well as because of the University of Chicago's training of economists who later worked for the junta government.

These were also bound to be issues that caused dissension and controversy among economists. Perennial considerations factored into the debate over Friedman's 1975 trip: as Laidler (2007, p. 6), the "ethical issues raised by this affair" pertained to long-debated matters facing economists and so contributed to a permanent controversy.

In his memoirs, Friedman criticized the reticence of members of the economics profession when it came to offering public defenses of him, particularly during the 1976 period of criticisms of himself.[245] He noted Zvi Griliches as having been an exception: the Harvard University

[244] Friedman and Friedman (1998, p. 402).
[245] Friedman and Friedman (1998, p. 403).

economics professor had spoken up for Friedman in the controversy in the main student newspaper, doing so very largely on the same grounds on which Friedman had defended himself (*Harvard Crimson* (Harvard University), November 1, 1976). Earlier, Friedman had been present in person when his longtime sparring partner Robert Eisner criticized efforts to disrupt Friedman's speaking events, with Eisner contending that this would "only arouse antagonism" toward the protesters among those observing the events (*Daily Northwestern* (Northwestern University, Illinois), March 1, 1976). But Friedman, in complaining about the absence of more widespread defenses of himself, was implying that there was very considerable agreement with him among economists during the mid-1970s—and that this did not become apparent during the furor over himself and Chile, in part because of other economists' concern about themselves becoming subject to the protest movement or to other public criticism.

As already indicated, on the matter of the economic propositions that Friedman advanced about inflation, including his tracing of the problem to monetary policy and his contention that removing a massive inflation required a simultaneous monetary-fiscal response, these did indeed, by 1976, command considerable agreement in the U.S. economics profession, and this agreement increased after 1976. With regard to his free-market views and prescriptions, the center of gravity in professional opinion was not, in 1976 or later, as wholeheartedly in favor of economic liberalism as Friedman himself was. But mainstream U.S. economists certainly did not subscribe to the strongly interventionist positions often articulated by many of Friedman's public critics in 1976 and later, nor would they be as quick as Naomi Klein (2007, pp. 304–305) was to associate Adam Smith's economics with lawlessness.

Against this backdrop of notable overlap of views with Friedman on economics, there was in the mid-1970s, and continued to be in subsequent decades, a diversity of views among economists on the appropriate relationship between U.S. academics and dictatorial regimes. Among the next generation of economists after Friedman, one of the most prominent, Joseph Stiglitz, became outspokenly critical of Friedman for having gone to Chile in 1975 (see, for example, *Rutgers* magazine, Fall 2006, p. 27). Nor was there uniformity among monetarists on the matter of whether Friedman should have taken the trip. Allan Meltzer supported Friedman on the issue. But during the late 1970s, the elder monetarist Clark Warburton opposed Friedman on the matter (Michael Warburton, personal communication, May 21, 2015).

In the wider public debate, the respective positions of Friedman and his critics remained essentially unchanged after 1975–1976. Friedman stressed that he aimed to improve economic

conditions in Chile and that such economic improvement would be a force for political liberalization. His critics, in contrast, did not accept Friedman's position that support for the direction of Chile's economic policy was compatible with opposition to its political arrangements. To these critics, Friedman and other U.S. economists should have refrained from a dialogue with Chilean officials on economic matters until a government that did not engage in repression of the populace had come into power.

TRADE CREDITS AND THE SOVIET UNION

In the 1950s and 1960s, Friedman made numerous comments on the Cold War but mainly limited himself to economic aspects of the U.S.-USSR conflict, including the implications of different economic systems for living standards and employment opportunities: see Nelson (2023). By the mid-1970s, however, Friedman was increasingly inclined to come out with public commentary that was focused on the national security—as distinct from the more purely economic—aspects of the East-West competition. During this period, he associated himself with the view—advanced by many "hawkish," or hardline, critics of the defense and foreign policies emanating from the Republican administrations and the Democratic-controlled Congress in this period—that the United States was not taking the measures needed to address growing Soviet military strength.

This assessment that there was a growing danger to the Western side in the evolving superpower balance, and related warnings that hardliners made about the geopolitical outlook, challenged the consensus prevailing in U.S. public discourse during the mid-1970s that the degree of East-West tensions, and the accompanying danger of world war, had been lowered considerably since the start of the decade. Friedman largely shared, particularly from 1975 onward, the hardliners' doubts regarding the prevalent favorable interpretation of many of the foreign policy developments seen in recent years. In so doing, he substantially endorsed the position taken by the administration's defense-hardliner detractors that the threat to the Western world posed by the USSR had increased during the first half of the 1970s, just when—largely with the administration's encouragement—the U.S. public perception of that threat was decreasing.[246]

But, as discussed later, Friedman also parted company with these hardliners—many of whom were, on account of their role in, or support for, past Democratic administrations, increasingly

[246] The perceived diminution of this threat was tied to the prevalent tendency during the 1970s to refer to the Cold War as a period in the recent past, rather than as an ongoing state of affairs.

coming to be labeled “neoconservatives”—on significant specific aspects of their critique of official U.S. policy.

Détente in the 1970s and U.S.-Soviet trade links

The notion, prevalent in the late 1950s, of an *economic* contest between the U.S. and USSR economic systems had largely dissipated by the 1970s: the USSR was widely acknowledged as set to remain well behind the United States in economic performance for the foreseeable future.[247] But the military and geopolitical contest between the superpowers continued. Against the background of this ongoing competition, the Nixon and Ford Administrations advanced policies of détente that were intended to reduce tensions between the two blocs. As will be detailed below, Friedman was of the view that the Soviet Union’s threat to the United States and its allies was not really diminishing during this period, and he expressed himself publicly on this matter in the mid-1970s even though doing so meant taking a stand on subjects well outside his own expertise. But he was also called upon to comment on an aspect of the détente policy that was more clearly within the discipline of economics: proposals to expand trade with the USSR.

Friedman, who would be a longstanding opponent of general economic sanctions on countries, was well disposed toward the notion of having trade relations with the Soviet Union even while that country remained a geopolitical adversary of the United States. In 1962, in *Capitalism and Freedom*, he indicated that travel to the USSR should be unrestricted.[248] Indeed, the Friedmans actually were in the Soviet Union for a couple of weeks in late 1962, after *Capitalism and Freedom*’s completion. But in the same year in *National Review* (May 22, 1962, p. 363), Friedman had provided what was, on his part, a very rare instance of an expression of sympathy with the idea of economic sanctions—when he suggested that trade barriers against USSR hurt the United States but may be worth imposing on the grounds that they probably harmed the Soviet Union more.

---

[247] Even from the vantage point of 1970, Paul Samuelson could note: “Of course, we all know that Mr. Khrushchev is gone and that his words [of USSR economic catch-up by 1980] showed him not to have been a prophet. Far from the USSR having overtaken the United States, [it] still remains very far behind. Indeed, we still have about double the real GNP of the Soviet Union—depending upon how you calculate ruble purchasing power parity and dollar purchasing power parity. The experts, I think, would say that the Soviet Union has [aggregate output equal to] ⅓ to ⅔ [of the U.S. total], depending upon which calculation you make. And, if we split the difference, that means about one-half. Now, it is true that the Soviet Union [in the 1960s] showed a percentage rate of growth of its real GNP a little more than ours—but the remarkable thing is how little [an excess] that was.” (Instructional Dynamics Economics Cassette (Paul Samuelson series) Tape 57, August 24, 1970.)

[248] Friedman (1962a, p. 8).

Even with regard to market economies, however, Friedman was not a subscriber to the position that a nation's economic growth rested crucially on the volume of its international trade. And, in the case of the Soviet Union, he felt that even if it had ample opportunity to trade with other nations, its collectivist internal arrangements would condemn its aggregate economy to stagnation. With the contribution that Soviet exports to or imports from the United States or other countries could make to USSR economic performance certainly assessed as marginal, Friedman became more definitely in favor after 1962 of free trade with the USSR, even though he would continue to assess the Soviet geopolitical threat to be very high. Accordingly, he explicitly included the USSR when he remarked in late 1974: "I would be in favor of abolishing all tariffs against all nations." (Instructional Dynamics Economics Cassette Tape 148, June 11, 1974.)

By the time of these remarks, the détente policy had been associated with trade agreements between the United States and the USSR, and the Ford Administration was proposing the next step of granting the Soviet Union most-favored-nation (MFN) trade status. Friedman went only partway in endorsing this proposal. He indicated that he was not opposed to the Soviet Union being treated symmetrically with other countries in ordinary goods trade with the United States and, in particular, that he agreed with the administration that a granting of MFN should not be conditional on securing USSR concessions outside the trade area. In particular, he agreed that MFN conferral should not be conditional on the USSR's government expanding the rights of its citizens, including the right to emigrate (Instructional Dynamics Economics Cassette Tape 148, June 11, 1974).

The sting in the tail in Friedman's support for the administration position was one that also applied to the U.S. government's existing détente-related trade agreements. Although these agreements had involved sales of American-made goods to the USSR, the purchases had in part involved some form of U.S. government-provided trade credits, under which the Soviet Union was able to borrow from the U.S. government the funds that settled the purchase. This practice was not altogether out of line with U.S. government-brokered trade agreements with other countries. But, to Friedman, the existing practice was itself a problem—being governmental subsidization of the transactions. With regard to the possibility of MFN arrangements applying to the USSR, he opposed them insofar as they helped continue to "make it possible… for the U.S. taxpayer to subsidize the Soviet Union." He urged that MFN should be granted together with the "strict specification that neither directly nor indirectly will the U.S. in any way subsidize [USSR-related] trade, either by guaranteeing credits, by insuring against expropriation, or by

direct subsidy or direct loans to the Soviet Union. Of course," he added wryly, "if we did that, the Soviet Union's enthusiasm for this measure would decline greatly." (Instructional Dynamics Economics Cassette Tape 148, June 11, 1974.)

This position—that there should be free trade in goods with the USSR, including sales of American agricultural products to the Soviet Union, but that the U.S. government should not extend trade credits or loans in this process—was one that Friedman reaffirmed during the Carter and Reagan years.[249] He was, most notably, an outspoken critic of President Carter's grain embargo against the Soviet Union (see the discussion of 1980's events in Chapter 10).

In the event, MFN status for the USSR did not go ahead in 1974−1975. In large part, this was because Congress made humanitarian concessions a *quid pro quo* of MFN, and the USSR refused to accept such linkage. That refusal meant that the U.S.-USSR Trade Agreement that the countries signed in 1972 did not come into effect (see Garthoff, 1994, pp. 509−513). Another factor making for the failure of the agreement was that one key trade deal of 1972 that had proceeded over the intervening period—sales of grain to the USSR—had proved to be highly favorable to the Soviet Union, because it received the grain at the prices prevailing before the 1972−1974 surge in world commodity prices. The trade issue had consequently become a politically negative factor for the Ford Administration—with Jimmy Carter, seeking the Democratic presidential nomination, using one campaign appearance to criticize "the so-called 'advantages' of détente," remarking in this connection that "every time we've had a major trade with Russia, we've lost." (*Houston Post* (Texas), December 12, 1975.)

To Friedman's disapproval, the "Great Grain Robbery" episode, as it became known, was added to the catalogue of cost-push explanations for recent high U.S. inflation—the suggestion being made that the sale had helped raise U.S. grain prices and that this price pressure had spread elsewhere. Walter Heller invoked the grain sale as one of the reasons for the post-1972 surge in U.S. inflation.[250] So did Arthur Burns. In a Congressional hearing (held on September 4, 1975) that had been convened on the economic effects of the grain sales, the Federal Reserve chairman stated that "concern about the effects of rising food prices on the overall rate of inflation is clearly warranted."[251]

---

[249] For example, he did so in *Milton Friedman Speaks*, Episode 8, "Free Trade: Producer Vs. Consumer," taped April 27, 1978, p. 26 of transcript; in *Newsweek*, November 15, 1982; and in Friedman (1989d, p. 369).
[250] See his remarks quoted earlier in this chapter.
[251] In Committee on Agriculture and Forestry, U.S. Senate (1975, p. 3).

Almost a year earlier, concern about a new grain shortage had led the Ford Administration to cancel corn and wheat shipments to the USSR, overriding U.S. exporters' commitments to make about $500 million in sales. This action was taken on October 5, 1974, and was only partially reversed in a follow-up trade arrangement made two weeks later (Garthoff, 1994, p. 509). Friedman publicly criticized Ford for this intervention, believing that the transactions should have been allowed to proceed as contracted (*Chicago Tribune*, October 18, 1974). As for inflation, he noted that the grain deal—being adverse to the United States' terms of trade—may have led to a small shift up in the American price level—but that it had played only a trivial role in the overall behavior of inflation in the 1970s (*Newsweek*, May 12, 1975).

While opposed to such U.S. government restrictions that impeded regular U.S.-USSR trade, Friedman concurred with prohibitions of shipments to the Soviet Union of U.S.-produced goods of a military or strategic nature.[252] In the late 1970s, he expressed concern that "technology and equipment" exports to the USSR had gone too far since 1972.[253] He contended during the same period, however, that the items whose export should be prohibited on security grounds constituted, on the whole, "minor exceptions" to the general rule that U.S. trade with the USSR should proceed freely.[254]

Of course, a more general question was whether trade relations with the USSR could strengthen the Soviet economy and thereby put it in a position to build up its military forces still further. A declaration that this was what actually happened would be made by one U.S. foreign policy hardliner, who stated (Lee, 1980, p. 101): "In the 1970s, the Soviet military buildup has been greatly facilitated by trade, credits, and loans from the U.S. and its allies."

This assessment, however, was the kind of economic proclamation by U.S. defense hardliners that Friedman tended to regard as misconceived. As indicated above, Friedman did oppose U.S. government measures that were literal subsidies of Soviet commerce because they offered non-commercial terms to the USSR. Indeed, in one of his interventions in this period on foreign policy, Friedman in 1977 included trade credits, as well as government-guaranteed loans to the USSR and Eastern Europe, provided by the United States and its allies, together with U.S. foreign policy setbacks as steps that put the Western world closer to a future of USSR world

[252] See, for example, Friedman (1989d, p. 368).
[253] Friedman (1977a, p. 26).
[254] *Milton Friedman Speaks*, Episode 8, "Free Trade: Producer Vs. Consumer," taped April 27, 1978, p. 13 of transcript.

domination.[255] Usually, however, Friedman was much more circumspect. He was, as already noted, not one who put great weight on trade as a driver of countries' real output growth, and he certainly did not see it as a means by which command economies could make major strides. With regard more specifically to the Soviet Union, while he acknowledged the size of the economy as a broad constraint on the regime's choices, Friedman was not a strong subscriber to the view that its decisions regarding defense spending had a continuous relationship with the country's total volume of production, and he viewed the Soviet government as having considerable scope to maintain or raise the defense share of output in the face of economic pressure.[256]

With respect to the capital account of the balance of payments, former U.K. diplomat Duncan Wilson (1975, p. 128) suggested that as part of its motivation for détente, the USSR sought injections of capital funds from the West as a means of expediting a move to an increased growth rate of aggregate output. On the surface, historical precedents seemed supportive of the notion that a capital inflow might well benefit a country's growth. In this connection, Mussa (1986a, p. 112) observed: "In earlier periods, direct purchases of foreign bonds by individual investors played an important role in private international capital movements. British investors, for example, helped finance railroad construction in the United States, Argentina, and tsarist Russia."

But Friedman had grounds for doubting that these precedents applied to the case of the United States and other Western nations lending to the USSR. He was himself often a proponent of the benefits that a country could accrue from a capital inflow, but his arguments in this connection were made in the context of private-sector-produced capital flows between market economies. In contrast, Friedman did not believe that an injection of foreign capital could be counted on to have a beneficial effect on Soviet economic growth: for he was impressed by the degree to which a command economy like the USSR's could, in its process of capital accumulation, allocate the capital to wasteful activities.[257]

In any event, and consistent with his opposition to the geopolitical competition being a grounds

[255] See Friedman (1977a, pp. 25–26).
[256] See Chapter 15 below.
[257] Consistent with this, the study of the Soviet economy by Hardt and Holliday (1973, p. 16) cited misdirection of capital expenditures as a reason why the Soviet Union's productivity level was far behind that of the United States despite the former country having much higher had a long record of higher ratios of investment spending to GNP. See also the analysis of Friedman's views on this matter in Nelson (2023).

for imposing general economic sanctions, Friedman did not oppose the private sector of the Western countries being a source of loans to the USSR (meaning, necessarily, the public sector of that country), provided that these were not subsidized by Western governments.[258] Similarly, when in the 1980s, although he felt that loans to the East bloc were taking away funds that would have been deployed more productively in the Western world, he did not regard it as appropriate for existing loans to the East bloc by U.S. commercial banks to be turned into an economic weapon against the USSR: he instead regarded it as appropriate for these lending relationships to continue, if the banks wished.[259]

The military strength of the Soviet Union and the United States

Friedman felt that the way to respond to the Soviet bloc in the 1970s was through strengthening of the Western, and especially U.S., military effort. As was discussed in Chapter 3, Friedman felt that the United States' status as a leading technological power should be put to advantage in the military area by a focus on capital *vis-à-vis* labor in defense policy. He was concerned that this was not happening in practice. In this connection, in a public letter of December 2, 1970, Friedman referred to the "current mood of the country and of Congress is starving the military for research funds… I have much sympathy with the view that the present climate of opinion is reducing too much of the funds available for military research."[260]

U.S. defense spending was falling in the early 1970s as a result of America's lowering of troop commitments to the Vietnam War, but Friedman's remarks were referring to a public mood (itself in good part a backlash against the nation's involvement in Vietnam) urging more general cuts in U.S. defense spending. He opposed this prescription. Friedman stressed that the contest with the Soviet Union had not ended—and was concerned that the decline in U.S. defense spending was liable to become excessive, especially in view of the fact that the USSR's defense spending had been rising in recent years and this increase was set to continue. "Our military strength, *vis-à-vis* Russia, not only has been declining, but [it also] looks as if it's going to decline much further," he observed in a television appearance taped near the end of Nixon's third year in office (*Firing Line*, PBS, January 5, 1972, p. 6 of transcript).

---

[258] See Friedman (1977a, pp. 25–26) and *Milton Friedman Speaks*, Episode 8, "Free Trade: Producer Vs. Consumer," taped April 27, 1978, p. 26 of transcript.
[259] Again, see Chapter 15 below for a detailed discussion.
[260] In Committee on Appropriations, U.S. House of Representatives (1971, p. 397).

Four years on, U.S. real defense spending had indeed declined further: in 1975, it was nearly 15 percent below its 1971 level, with an additional small fall occurring in 1976 (Council of Economic Advisers, 2011, Table B‒6, p. 197). Furthermore, the Soviet military expansion had continued during these years of falling U.S. military expenditure. Against this background, Friedman, in a column critical of rising government spending under President Ford, identified the defense area as one that warranted increases, in light of the Soviet Union's military buildup (*Newsweek*, February 9, 1976). He therefore implied that the course of defense spending in the United States in the 1970s had been the opposite of that warranted by the behavior of its principal geopolitical opponent.

This stance was part of a wider critical attitude that Friedman had adopted toward the conduct of East-West policy under the Ford Administration, including under U.S. Secretary of State Henry Kissinger. After having been critical of Kissinger's ventures into economic policy, Friedman started expressing increased doubts about Kissinger's stewardship of foreign policy, too.

III. PERSONALITIES IN INTERNATIONAL ECONOMIC POLICY AND GEOPOLITICS, 1975–1976

HENRY KISSINGER

In December 1972, at the tailend of President Nixon's first term and about ten days ahead of Friedman's traveling to Rochester, Minnesota, for his heart operation, one of that city's local newspapers put on its front page a wire item concerning a change in U.S. Cabinet arrangements. The article reported that Secretary of the Treasury George Shultz would have an expanded set of responsibilities in economic policy in the president's second term, along lines intended to allow Shultz to oversee the whole of U.S. economic policy (*Rochester Post-Bulletin* (Minnesota), December 1, 1972). The wire report interpreted this revamp of Shultz's role as giving him a status that was the counterpart in economic matters to that possessed by Henry Kissinger—at the time, the president's national security adviser—in foreign policy.

This parallel was very inexact. In particular, the independence of the Federal Reserve meant that U.S. economic policy was not amenable to being centralized to the same degree as decisions on U.S. foreign policy. But the reference that the article made to Henry Kissinger's role underscored the fact that, even before he was assigned the additional post of Secretary of State in August 1973, Kissinger was, along with the president, the leading foreign policy figure in the

administration. In this capacity, Kissinger had already established the globetrotting celebrity image that would subsequently lead Friedman to remark, in connection with the travels that came with his receipt of the Nobel economics award in 1976, "I felt to some extent like Henry Kissinger."[261]

From academia to the center of policymaking

In common with Friedman, Kissinger had a career background as a university professor—in Kissinger's case, at Harvard University. Also like Friedman, Kissinger had, as an academic, been able to include in his output research work, popular writings, and other commentary on public policy, while also engaging in occasional advice to U.S. presidential candidates. Indeed, during 1964, the year in which Friedman was an economic adviser to Barry Goldwater, Kissinger's role in the primaries portion of the campaign had been as a foreign policy adviser to Nelson Rockefeller, whom Goldwater defeated for the Republican presidential nomination. Following the primaries, in a pre-election display of unity on the Republican side, both Friedman and Kissinger were contributors to *The Conservative Papers*, a book published during the 1964 presidential campaign proper and featuring contributions by GOP-supporting public intellectuals.[262]

In 1968, both Friedman and Kissinger had advisory roles in the same presidential campaign—that of Richard Nixon. In this campaign, however, Kissinger's participation was heavy, while Friedman's was, in contrast, very modest. Consequently, they never met during 1968's campaign activities. Friedman and Kissinger in fact never encountered one another at all in the 1950s and 1960s, although Friedman had had correspondence with Kissinger in 1958 on a routine matter (when he sent Kissinger a letter of recommendation for a third party).[263] They were both guest speakers (at different sessions) for the annual conference for bank correspondents held by the First National Bank of Chicago at the Conrad Hilton Hotel, Chicago, on November 21–22, 1966.[264] Friedman did not actually meet Henry Kissinger until the 1980s, when George Shultz, by then U.S. Secretary of State, arranged a social occasion in California

[264] Reflecting in part the ranking of their national fame at this point, Kissinger was perceived as the star speaker obtained for the event (*Chicago Tribune*, October 30, 1966).

that both Friedman and Kissinger attended.[265]

Kissinger, of course, was Shultz's most famous predecessor in the position, having been Secretary of State in 1973−1977 under Nixon and then Ford. Kissinger's years in that role were the culmination of a major divergence between his career trajectory and Friedman's. Friedman at the end of the 1970s would be described in one commentary as the "Henry Kissinger of economics," on account of the high profile that each had in their respective fields (*Arkansas Gazette* (Little Rock), October 6, 1979). But with regard to most U.S. government economic decisions, and certainly those in the monetary area, Friedman knew, and talked to, many key figures but was not himself a participant when it came to taking actions. Kissinger, in contrast, became immersed in U.S. policy formation. Both had become, by the late 1960s nationally known professors who published public-policy work alongside research, but, of the two, only Kissinger then moved from celebrity academic to full-time government service.

Kissinger became national security adviser at the onset of the Nixon Administration in 1969. Notwithstanding the job title, Kissinger's adviser position was a *de facto* policymaking role, as the 1972 press item quoted above implied. Notably, during Kissinger's tenure, Kissinger's contributions to foreign policy were often in practice more central than those of Nixon's first Secretary of State, William Rogers.

Hedley Bull's (1980, p. 487) characterization therefore applied to the whole of Kissinger's 1969−1977 tenure in the Nixon and Ford Administrations: Kissinger, "in stepping so effortlessly into the world of high policymaking, acted out the secret dreams of countless academic experts." Notwithstanding his disclaimers, it is highly likely that, in the field of economics, Friedman counted among those many experts who aspired to be a policymaker—even if, in his ideal world, the policymaking would largely involve enforcing and overseeing an automatic monetary policy rule.

As of 1973, Friedman seemed to like much of the substance as well as the style of the Nixon Administration foreign policy with which Kissinger had become closely associated. When, in June of that year, Friedman said that, notwithstanding his disapproval of Nixon's domestic economic measures, he felt that the president had done "a magnificent job in many areas," he likely had in mind foreign policy (*The Sun* (Baltimore), June 15, 1973, p. C16).

[265] Friedman may, however, have been an audience member at a Kissinger speech or speeches on occasions before this direct interaction.

The administration's negotiations with China likely played a part here. Although Friedman abhorred the rule of Mao, he was receptive to improving U.S.-China diplomatic and economic ties. Friedman wrote very little on China during the 1970s, but he clearly approved of the Nixon-Kissinger efforts, developed early in the decade, to establish more regular relations with China, and he reaffirmed this approval of a number of Nixon's "imaginative" foreign policy initiatives in later years.[266]

As of the first quarter of 1975, Friedman still seemed predominantly favorably disposed toward the Kissinger record, describing him as "great man" (*Newsweek*, March 31, 1975). From April 1975 onward, Friedman would turn to a more negative perspective on Kissinger's achievements, as discussed below. Even by March 1975, however, Friedman had reached the conclusion that there was an important area in which Kissinger lacked talent: economics.

Kissinger's lack of economic expertise

The judgment that Kissinger was no expert in this field was not novel to Friedman: his "critics accuse him of not knowing much economics," the *New York Times*' Leonard Silk observed (*Kansas City Star* (Missouri), February 14, 1974), while the general skepticism about Kissinger's command of economics was registered in such headlines as "Henry Is Right: World Economics Expert He Ain't" (*Arizona Republic* (Phoenix), April 18, 1974) and "Henry the Economist" (*Omaha World-Herald* (Nebraska), June 3, 1975).[267]

Doubts about Kissinger's command of economics were borne out in the unscripted question-and-answer portion of a National Press Club appearance that Kissinger made on February 3, 1975, on the subject of energy. In describing the domestic oil-price proposals that the administration had advanced, he cast the proposed rebate to consumers as one that implied that "the inflationary

[266] See Friedman and Friedman (1998, p. 388) for this quotation.

[267] Earlier, an analysis of some of Kissinger's past writings, as well as his absence from much of the August 1971 U.S. government talks on international economic policy, had been seen as indicating "Dr. Kissinger's almost obtuse disregard for matters economic" and that economics was his "blind spot" (*Financial Times* (London), March 20, 1973). It would seem on the surface that strong reinforcement of the judgment that Kissinger lacked expertise in economics received confirmation in the diaries of Arthur Burns, who worked with Kissinger in the White House during 1969 and subsequently in Federal Reserve-Administration meetings. But Burns' diary description of Kissinger as "a brilliant political analyst, but admittedly ignorant of economics" (in his November 26, 1971, diary entry, in Ferrell, 2010, p. 66) was undercut by the fact that, in the same passage, Burns rendered a verdict of "a no less confused amateur economist" on George Shultz—who certainly *was* a trained economist, but who was at loggerheads with Burns because of Shultz's opposition to incomes policy as an anti-inflation device (and who, in espousing a free-market solution to the energy problem in 1973–1974, would have a further major clash with Burns).

impact [of price decontrol] will be severely minimized, if not eliminated."[268] In so doing, Kissinger confused the concept of preventing an impact on inflation from coming from oil price decontrol with the concept of shielding consumer purchasing power from the measure.

This February 1975 speech was part of Kissinger's efforts as Secretary of State to become a force in economic policy. Eight months earlier, the London *Financial Times* (May 28, 1974) had already noted "Dr. Kissinger's avowed interest in giving the State Department a bigger say in foreign [that is, U.S. international] economic policy." U.K.-based economics commentator Malcolm Rutherford similarly referred, in early 1975, to "Dr. Henry Kissinger, the U.S. Secretary of State, who is now devoting much of his attention to economics" (*Canberra Times* (Australia), January 9, 1975).[269]

The issue on which Kissinger focused in attempting to establish an economic-policy role for himself was that of energy—in particular, dealings with OPEC. The Secretary of State's energy policy proposals would generate ire on the part of Friedman, who considered the quality of the economic analysis underlying them to be very poor and the outcomes that they would produce, if implemented, to be highly undesirable.

Political versus economic solutions

Crucially, Kissinger's involvement in this matter began in earnest during the initial embargo period (through March 1974) that occurred in the first stage of the oil shock. That entry point was significant, because the steps that Kissinger proposed in response to the embargo—which was clearly a political action, and not just an economic one, on the part of OPEC—were those he continued to stress when OPEC kept the world oil price high after it lifted its prohibition of petroleum sales to the United States.[270] In this post-embargo period, the oil shock remained, in

---

[268] In Joint Economic Committee (1975h, p. 75).
[269] Rutherford noted that Kissinger had told reporters at a press conference in late 1974 "that no adequate theory exists to deal with the concurrent problems of inflation and recession." In so doing, Kissinger was taking the stance—common among non-economists, but anathema to Friedman and to many Keynesians, too—that economic analysis could not account for the phenomenon of stagflation. Even though he returned, after 1975, to avoiding coverage of economic matters, Kissinger repeated this stance on stagflation. He did so, for example, in a television appearance in early 1980, when he remarked: "there's no question that the economic performance of the United States over a substantial period of time has been unsatisfactory... a conjunction of low productivity, high inflation, high unemployment, and other factors that is totally unprecedented and for which our government have not found a theoretical or a practical tool." (*The Money Programme*, BBC2, February 3, 1980, p. 2 of transcript.)
[270] Consistent with this interpretation, Paul Samuelson (in Instructional Dynamics Economics Cassette (Paul Samuelson series) Tape 187 (Paul Samuelson series), [late] September 1975) characterized Kissinger as believing

the form of high oil prices, but had become basically an economic move by OPEC, rather than a political one. Kissinger's proposed policy responses, however, reflected a focus on international negotiation and on contingency planning. They therefore reflected a perspective that the oil shock was fundamentally a political problem rather than an economic one and, consistent with this posture, Kissinger told an international gathering of policymakers in September 1974, held at Camp David, that "we must respond to the political as well as the economic implications of current trends."[271]

During the embargo, Kissinger proposed cooperation among consumer countries to share a fixed supply of oil (*Financial Times* (London), December 19, 1973). In elaboration of this position, later in the embargo, Kissinger, in the opening address to a February 1974 energy conference, stated: "The United States declares its willingness to share available energy in time of emergency or prolonged shortages." (*The* [*Evening*] *Post* (Wellington, New Zealand), February 12, 1974). And even in the post-embargo period, Kissinger's thinking was oriented toward embargo scenarios rather than dealing with high prices without an embargo: for example, in his February 1975 talk he cited as a reason for adopting his proposals the need to be well situated "in the event of a new embargo."[272]

In both the pre- and post-embargo periods, Kissinger saw the matter of oil in terms of collective actions by governments: cooperation among the United States and its allies on energy policy, and international negotiation between consumer-producer relations. This contrasted with Friedman's view that the appropriate U.S. policy response to the oil price increase was to allow the price system to operate freely and so have the market generate forces making for new energy supplies and lower prices. He was accustomed to viewing the market system as impersonal, as it aggregated many individual demands and supplies and equilibrated them—often without direct interaction between the market participants. In contrast, the Kissinger conception of the oil price as something to be negotiated made it a foreign policy matter, with the world's energy solutions envisioned as flowing from discussions between senior members of different national governments.

Kissinger therefore came into the energy problem predisposed toward looking at it in terms

---

that, in the energy area, "the main problem is to show the rest of the world that the U.S. can't be bullied by an oil boycott—that we mean business and are going to make ourselves independent of foreign supplies of oils."

[271] From his remarks, in Galpern (2012, p. 31), at a meeting of G5 officials held on September 28, 1974.

[272] Joint Economic Committee, U.S. Congress (1975h, p. 69).

different from those in which economists viewed it. Nevertheless, in what was seen at the time as helping to counter the impression that he was shunning economic analysis, Kissinger's February 1974 speech on oil invoked the concept of Pareto optimality (*Kansas City Star* (Missouri), February 14, 1974). This particular economics reference was, however, one that was unlikely to cut much ice with Friedman—in view of his preference for individual-market-based analysis of issues such as energy supply over general equilibrium-based application of the Pareto type to these matters.

Also in the February 1974 speech, Kissinger stated: "Our ultimate goal must be to create a cooperative framework within which producers and consumers will be able to accommodate their differences and reconcile their needs and aspirations." (*The* [*Evening*] *Post* (Wellington, New Zealand), February 12, 1974.) This was a position that Kissinger maintained as he continued to engage in energy policy in the no-embargo, but high-oil price, environment, of the rest of 1974 and 1975.

In contrast, Friedman believed that the demand-and-supply equilibration via market forces provided just such a "cooperative framework." In such a system, individual consumers' behavior, not consciously coordinated but guided by price behavior, would, in combination with supply incentives, produce pressure on price and supply that were in the needed directions. Kissinger instead believed, as he put it privately in September 1974, that "we should develop a coordinated response"—with his conception of coordination here again meaning that between governments: "the prices should be subject to political decisions by consumer governments."[273]

In a study discussed further below, Friedman's former student G. Warren Nutter (1975, p. 17) suggested that Kissinger's "limited exposure to the subject of economics" was evident in his concentration on personalities, particularly leading figures in government—rather than impersonal mechanisms—in the solution of problems. Nutter reached this conclusion after analyzing Kissinger's approach to political and military relationships. But, as already implied, evidence in favor of Nutter's thesis was very clear in Kissinger's approach to heavily economic matters such as oil prices.

One item in Kissinger's proposals was what, at the September 1974 meeting, he called "financial

[273] From his remarks at a meeting of G5 officials at Camp David, September 28, 1974, in Galpern (2012, p. 30).

solidarity" among oil-consuming nations.[274] Under his proposed arrangement, countries' governments would leave in what Kissinger variously called a "common trust fund" (Galpern, 2012, p. 42), a "solidarity fund" or a "mutual insurance fund" (Joint Economic Committee, U.S. Congress, 1975h, p. 69), intended as a means of helping finance the higher levels of member countries' current account deficits that were expected to result from the oil shock. This $25 billion fund was indeed set up in January 1975 (Joint Economic Committee, U.S. Congress, 1975h, p. 69). But it was rendered redundant by the success, discussed earlier in this chapter, of private-sector petrodollar recycling processes as a means of financing the consumer countries' current account deficits following the oil shock.

But it was another part of Kissinger's energy package—the proposed management of the oil market itself—that Friedman would seize upon and that would underlie Friedman's negative judgment regarding the Secretary of State's economic aptitude. In the September 1974 multi-country meeting of economic policymakers, Kissinger suggested that "we must demonstrate that major consumer countries are willing to protect their interests through consumer solidarity" (Galpern, 2012, p. 32). Kissinger's public-policy suggestions about how to implement such "consumer solidarity" in the world oil market would generate a Friedman critique.

Consumer solidarity proposals

Kissinger's proposal was essentially that the oil-consuming nations form a united front—in effect, a monopsonistic cartel—as a means of countering the oil-producing cartel of the OPEC nations and of allowing the world oil price to be subject to a negotiation process encompassing oil-producing and oil-consuming nations. Federal Reserve Chairman Burns was involved with Ford and Kissinger in designing these proposals. Burns endorsed the idea in Congressional testimony.[275] Reacting to this testimony the following day, Friedman added to his considerable stockpile of criticisms of Arthur Burns by taking issue with the idea of a consumer cartel. "He [Burns] recommended an agreement among oil-consuming nations to try to drive down the international price of oil. I don't believe producer cartels hold up, [and] I don't think consumer cartels hold up. I think that would be pure window dressing, that the market price of oil is, in any event, going to come down." (Instructional Dynamics Economics Cassette Tape 151, August 7, 1974.

---

[274] From his remarks at a meeting of G5 officials at Camp David, September 28, 1974, in Galpern (2012, pp. 32, 42).
[275] See Burns' testimony of August 6, 1974, in the Joint Economic Committee, U.S. Congress (1974b, p. 291).

By the time of Burns' public endorsement of it, Kissinger had already been pushing the idea of consumer solidarity for several months. A number of the reservations that Friedman would articulate about Kissinger in response to this stance were anticipated, in general terms, by newspaper columnist Michael Padev, who commented after Kissinger, in the early post-embargo period, had delivered a speech on the world economy, including the oil crisis, to the UN General Assembly. "Dr. Kissinger has often jokingly told newsmen that he is not 'the world's greatest economic expert,'" Padev remarked. "His UN speech proves him absolutely right. It is a real pity that a man of superb intelligence and such penetrating understanding of international political problems should talk such nonsense about the world's economy—and the methods to improve it." (*Arizona Republic* (Phoenix), April 18, 1974.) As will be seen, about eleven months later Friedman would articulate sentiments concerning Kissinger very similar to those voiced by Padev.

The campaign for a joint consumer-country position to be established as a stepping stone to a meeting between consuming and producing countries was a major activity in which Kissinger engaged through mid-1975. His public interventions on the matter included another UN address on September 23, 1974, in which he highlighted his vision of oil prices as something to be negotiated: "both producers and consumers have legitimate claims," he observed, in calling for a "new understanding between consumers and producers."[276] Kissinger gave another speech on the matter on November 14, 1974, this time delivered in the city of Chicago to the University of Chicago Board of Trustees, and used it to outline a "Blueprint for Consumer Cooperation."[277]

In a summary of his University of Chicago speech that he sent to U.S. ambassadors, Kissinger indicated that he would make the case that "cooperation among the major oil-consuming areas… is the fundamental prerequisite for an effective program of action."[278] Again, this perspective went against Friedman's longtime position that the market system provided a means of cooperation between agents, including across countries, and that an explicit governmental program of action was not needed to generate such cooperation.

The element of Kissinger's energy policy initiatives that would give rise to a major backlash, on the part of Friedman and others, against the Secretary of State would be his willingness to contemplate, and even help enforce, high oil prices as part of a negotiated settlement with OPEC.

[276] Galpern (2012, p. 28).
[277] Galpern (2012, p. 74).
[278] From Kissinger's telegram of November 14, 1974, in Galpern (2012, p. 76).

During 1974, Kissinger claimed to be interested in substantial oil price reduction. This was also the stance that he took in internal government discussions. For example, Kissinger suggested at an Oval Office meeting with President Ford on August 17, 1974 that "we have to find a way to break the cartel."[279] Likewise, Kissinger's November 1974 telegram to ambassadors explained his aim as being to "create the objective conditions for an eventual price reduction."[280] But his actual proposals indicated how much he was willing to compromise on this matter. Seeing the main problem as the danger of another embargo rather than high oil prices *per se*, and perceiving the pricing process as a matter of negotiation, he felt that OPEC would, in exchange for making guarantees on future supply, would have to be provided with a major concession: the consumer countries' explicit acceptance that much of the 1973−1974 oil price rise would not be reversed.

Furthermore, even if the world oil price were now to fall substantially, Kissinger wanted some of that decline prevented from reaching retail gasoline prices in the consuming countries. This wish arose from the fact that a prominent part of his proposals involved the consumer-country governments following policies aimed at promoting oil substitutes such as synthetic fuels. The development of oil substitutes, Kissinger believed, required keeping the petroleum price at home high enough to make them economically viable. "We do need some price protection," he insisted—meaning protection from eventualities in which domestic petroleum prices in the consumer countries fell by more than a specified amount.[281]

In effect, Kissinger was proposing an oil price stabilization scheme, possibly at quite a high price after tax. With respect to an ultimate agreement with producers, Kissinger had, by December 5, 1974, become amenable to arranging a constant world real oil price if the price was acceptable (Galpern, 2012, p. 86), and with respect to consumer countries' policies about prices at home, Kissinger stated, in a meeting on January 30, 1975, that "we could have agreement on a common overall price" of domestic price of oil across consumer countries.[282] Going public, in the speech on the oil crisis that Kissinger gave on February 3, 1975, he indicated that he did not want to return to a world of "[u]nconstrained consumption of cheap oil" and so, while he wanted oil prices down from their current "excessive" level, he also wished the consuming nations to put a

[281] From Kissinger's remarks at a meeting with U.S. Treasury officials on December 9, 1974, at the Secretary of State's office (Galpern, 2012, p. 88).
[282] From Kissinger's remarks in a meeting that he and Ford had on January 30, 1975, with U.K. prime minister Harold Wilson and U.K. foreign secretary, James Callaghan (Galpern, 2012, p. 126).

floor under the price of oil in their countries.[283] It would be a matter of further study to determine "the level at which prices should be protected," but it had to be "high enough to encourage the long-range development of alternative energy sources.[284] This would be part of an "eventual consumer-producer agreement."[285]

After this feature of the Kissinger energy plan was unveiled, members of Congress would label the plan "the Administration' Oil Floor Price Proposal" (Joint Economic Committee, U.S. Congress, 1975h).

It was against this background that Friedman made an intervention on the matter, in his *Newsweek* column of March 31, 1975. "Some people have a talent for economics; some, though highly gifted in other respects do not," he noted by way of introduction. Friedman then relayed his conclusion that, on the basis of "Henry Kissinger's pronouncements on economic matters," the Secretary of State fell into the latter category of individual. Friedman zeroed in on the consumer-cartel/floor-price proposal: if it succeeded, it would make the 1973–1974 oil price increase permanent by cutting off many of the demand and (non-OPEC) supply forces making for a decline in the oil price. Already resentful of U.S. government impediments to domestic oil price adjustment, Friedman objected to the Kissinger effort to move the oil market even further away from free-market conditions. As indicated earlier in this chapter, Friedman believed that, left to themselves, these forces would break OPEC and put the oil price below the pre-1973 price. The consumer cartel would probably not be assembled, Friedman judged, but if it did, the United States might be left "holding the bag" with the responsibility of enforcing the floor price when market forces were tending to drive the oil price below that floor. Friedman concluded the column: "Henry, do stick to politics." (*Newsweek*, March 31, 1975.)

By the time of Friedman's piece, Kissinger had also been criticized by Paul Samuelson in his own *Newsweek* column (March 24, 1975): "Recently I made headlines when I referred contemptuously to Henry Kissinger, 'boy economist,' with his new frenzy to guarantee permanently the high price of oil. The charge stands." The headlines to which Samuelson referred stemmed from a February 12 appearance in Gainsville, Florida, in which Samuelson reacted to Kissinger's floor-price speech of earlier in the month. "I think Kissinger should stay

[283] In Joint Economic Committee, U.S. Congress (1975h, p. 70). Kissinger had stated bluntly in a meeting with Ford and French government officials on December 15, 1974: "We never thought that consumer solidarity would produce lower prices." (In Galpern, 2012, p. 95.)
[284] Joint Economic Committee, U.S. Congress (1975h, p. 72).
[285] Joint Economic Committee, U.S. Congress (1975h, p. 72).

in power politics," Samuelson had remarked on that occasion. "… Some people are tone-deaf to economics. Kissinger is not cut out to understand economics. He's promising us [via his proposals] a high price of energy for a long time to come." (*The Star-Press* (Muncie, Indiana), February 13, 1975.)

The Friedman and Samuelson remarks in February-March 1975 were notable not only for their common ground regarding Kissinger's lack of economic expertise but also for Samuelson's implication that oil prices would likely come down substantially, provided that Kissinger's plan was *not* adopted. That they both took this stance reflected the prevalence in economic commentary in the first half of 1975 of the belief (a belief that, as discussed earlier in this chapter, would turn out to be confounded) that the oil price might soon fall considerably from its post-shock value—even though most analysts did not see the price as likely to decline by as much as Friedman was predicting.

The high point of Kissinger's economic interventions was in May 1975, when he gave three speeches on world economic policy—one on May 13 in Kansas City, one in Paris on May 27 to the International Energy Agency (the multi-government body intended to respond to the oil shock), and a May 28 speech, also in Paris, to the OECD (*Omaha World-Herald* (Nebraska), June 3, 1975). Despite this continuing public activity in favor of the consumer-cartel idea, the administration's proposals in this area were already floundering. Part of the problem was internal. Notwithstanding the support that they had from Burns and Kissinger, there was, in fact, high-level disagreement within the administration about forming a consumer-cartel bloc, Secretary of the Treasury William Simon was known to have objections to the notion that were similar to Friedman's, with Simon reportedly critical of the idea of negotiating prices with OPEC rather than letting the market system operate (*Omaha World-Herald* (Nebraska), June 3, 1975).

But the idea was also failing to generate wide support in U.S. public opinion and among America's allies. Shortly after Simon's testimony in March 1975, the Ford Administration had tried and failed to advance the cartel idea through international forums and was judged as having been unsuccessful in what was described as its efforts to "lay the groundwork for a grand meeting of oil producers and consumers" (*The Courier-Journal* (Louisville, Kentucky), September 2, 1975). Specifically, attempts in May to set up a conference of oil producers and consumers had broken down (*The Courier-Journal* (Louisville, Kentucky), June 3, 1975). No

consumer-producer conference materialized in later months, either.[286] A Department of State telegram sent to Kissinger on October 23, 1975, in effect acknowledged the proposals' declining momentum: "fewer industrial countries now think that the solution can be found in negotiations with the producers than did six months ago."[287]

Along the way, the concessions that the administration had made in its attempts to attract greater support from other oil-consumer governments to its proposals were telling. At a meeting with President Ford and the Secretary of State on January 30, 1975, Prime Minister Harold Wilson had suggested to Kissinger that there might be a case for a general program of stabilizing world commodity prices, not just oil. At that time, Kissinger had replied negatively.[288] By September 1975, however, the administration was indicating its willingness to contemplate broad-based stabilization of global commodity prices (*The Courier-Journal* (Louisville, Kentucky), September 2, 1975). This move amounted to serious contemplation, at the U.S. official level, of the kinds of schemes to which Friedman had voiced opposition in U.K. debates on the matter in the mid-1950s.

Despite the absence of a real groundswell of support for a consumer cartel, the U.S. and other governments continued to go through the motions and produced an agreement at a conference held on January 30–31, 1976, in Paris of the 18-government International Energy Agency on a consumer bargaining position (Sobel, 1977, p. 30). But this energy conference's decisions lacked substance for reasons similar to those that Friedman had cited in downplaying the importance of the Jamaica exchange-rate conference held earlier in the month. The Jamaica conference had ratified a system (floating exchange rates) that the authorities were largely compelled to accept anyway, while the Paris conference gave the consuming countries a supposed bargaining stance (a $7 oil price) for a price-setting dialogue with the OPEC cartel that OPEC—which was for the moment secure in its ability to enforce a much higher world price—had no interest in commencing.

[286] At a late stage in this process, Paul Samuelson returned to the Kissinger plan by describing it in his audio commentaries: "You fight oligopoly by oligopsony. A monopoly of a few sellers is to be checked by the countervailing power of the monopoly of a few buyers. And so Dr. Kissinger is to get together with the Japanese and the Germans and the French and form a tight little buying cartel. Then… there's [planned] to be hard horse-trading and dickering at some international conference." (Instructional Dynamics Economics Cassette (Paul Samuelson series), Tape 187, [late] September 1975.) One deviation between the actual 1974–1975 negotiations and this characterization was that Kissinger had not, in fact, been able to get France to agree to his scheme, and France declined to become a member of the International Energy Agency.
[287] In Galpern (2012, p. 296).
[288] See Galpern (2012, pp. 126–127).

By this point, Kissinger's economic interventions had receded. He would later remark about his areas of expertise: "I have never claimed any great confidence in economics." (*The Money Programme*, BBC2, February 3, 1980 p. 3 of transcript.)

Promotion of new alternatives to oil

As noted, part of the rationale for the oil price floor in the package pushed by Kissinger in 1974 and 1975 was the intention to guarantee an ongoing price environment conducive to the promotion of new, non-oil, sources of energy. A related Ford Administration proposal was to create a new Reconstruction Finance Corporation (RFC) that would invest government funds in firms that were attempting to develop alternatives to oil. Nelson Rockefeller, vice president in the administration, was a proponent of this idea and, having failed to obtain Congressional acceptance of it while in office, tried to revive interest in it after he left office, by testifying in favor of it early in the tenure of the Carter Administration.[289]

In contrast, Friedman rejected the notion that government seed funding was needed to get the private sector involved in energy substitutes on the scale needed: provided that the oil price was decontrolled and the revenues associated with these prices were allowed to accrue to the private sector, he saw the market system as capable of generating adequate incentive to expand energy supply on a large scale. Friedman was also specifically opposed to reestablishing an RFC. He had acknowledged previously that the original RFC had proved useful in the 1930s as a means of official recapitalization of the banking sector. In the environment of the 1970s, however, Friedman was concerned that a revived RFC might lead to an extensive government ownership stake in the nonfinancial U.S. business sector, especially if the nationwide general price controls (whose return Friedman believed was a strong possibility—see Chapter 5 above) put many major firms in a precarious financial state.[290]

Friedman's growing disaffection with détente

The decline in prestige of the U.S. presidency that the Watergate scandal generated and the public backlash against President Ford after his September 1974 pardon of Richard Nixon helped produce a leadership vacuum that further raised Henry Kissinger's stature. The Secretary of State's high standing during the Ford years did go through some fits and starts: in October 1974,

[289] See his testimony of September 13, 1977, in Committee on Finance, U.S. Senate (1977).
[290] See his remarks in Friedman and Kristol (1976, p. 16).

for example, Friedman noted that Kissinger seemed to be losing his status as a media favorite (Instructional Dynamics Economic Cassette Tape 157, November 6, 1974), while in the same vein, in early 1975, Paul Samuelson observed that Arthur Burns seemed to have displaced Kissinger in achieving plaudits for statecraft—a turn of events that, Samuelson reported, had left the Secretary of State unhappy (*Newsweek*, March 3, 1975).[291] But, riding out these fluctuations, throughout the whole of the Ford presidency Kissinger retained his status as a leading national and international figure.

Friedman, however, was developing more reservations over these same years about the Kissinger approach to global international relations. From his starting point of having a high regard for Kissinger's stewardship of U.S. foreign policy, Friedman had greater doubts about it after March 1975, specifically in the area of East-West geopolitics. In this period, he no longer primarily limited his reservations regarding the Secretary of State, as he had in his March 1975 column, to Kissinger's grasp of economic analysis.

One key step along the way to Friedman's doubts about the Ford-Kissinger foreign policy was the fall of Saigon in April 1975—in effect, the confirmation of Communist victory in Vietnam, decisively superseding the apparent peace settlement of 1973. Although Kissinger blamed Congress, in withholding funds and authorizations, for a large part of the failure of the 1973 settlement to hold, Friedman made clear that he did not exclude the administration from culpability. Friedman was visiting the Pacific at the time of the fall of Saigon, and he came back to his own country gloomy about its international role: "When Britain gave up its task as a guardian of the world's peace, the U.S. took up that task," Friedman remarked on May 2, 1975, in a television commentary. "We are now giving up that task. Who can, or will, replace us?"[292] Friedman expressed the same sentiment in his audio commentary series during this period (Instructional Dynamics, Economics Cassette Tape 167, early May 1975).[293] In the same commentary, he concluded: "I believe, therefore, that the next five or ten years are going to be very dangerous years, not only in the Far East, but throughout much of the world."

---

[291] Burns' rising prestige showed that Friedman's critique remained a minority view. In particular, cost-push views of inflation remained prevalent and, despite intensified debate in the media and Congressional circles on the matter, the general public remained disinclined to blame high U.S. inflation on Burns' prior actions. As Burns himself acknowledged shortly before the beginning of the Ford Administration (see his testimony of August 6, 1974, in Joint Economic Committee, U.S. Congress, 1974b, p. 281), the subject of monetary policy remained largely a mystery to the public.

[292] *CBS Morning News*, May 2, 1975, p. 13 of transcript.

[293] Friedman made a similar remark in early 1977, just after the end of the Ford Administration. See Friedman (1978b, p. 10).

The strategic nuclear balance

As these comments indicated, Friedman's concerns about the growing strength of the USSR went beyond the case of Vietnam or the future of the Asia-Pacific region and encompassed the United States' overall place in the general world power balance. By the start of the second half of the 1970s, Friedman was becoming skeptical about the policy of détente with the Soviet Union that had been launched by Nixon and Kissinger. In this rethinking, Friedman largely lined himself up with defense and foreign policy hardliners in the United States who were critical of the Kissinger approach to U.S.-USSR diplomacy.

The detente policy had much mainstream support in the United States, and a longtime critic of the Nixon presidency, Paul Samuelson, had praised détente in 1973 as an outstanding achievement of the administration (*Newsweek*, November 26, 1973). But Friedman, although not an outright critic of the administration's foreign policy through 1973, had a more reserved judgment than Samuelson on the policy moves associated with detente. As already noted, he was concerned from the start of the 1970s about the possibility of a precipitate decline in U.S. military spending, and on television in 1972 he had already spoken of the need to develop a consensus in favor of a "rebuilding of defense" after the Vietnam War commitments were wound down.[294] Furthermore, the possibility of World War III, while remote, was sufficiently prominent in Friedman's mind even in 1972 for him to mention it in an interview as one scenario (*Vision* (London), 1972, p. 44).

Friedman was also inclined to be wary about political agreements with Communist countries—one example of which was the Federal Republic of Germany's dealings in the early and mid-1970s with East Germany through its Ostpolitik policy, which Friedman judged to an initiative that "opens up all sorts of possible dangers" (Instructional Dynamics Economics Cassette Tape 117, March 14, 1973).

Over the period from 1972 to 1975, Friedman's exposure to defense hardliners who were critical of Kissinger also increased. This category of critics of the administration, as one observer put it, "accused [Kissinger] of being too easy on the Soviets" (*Omaha World-Herald* (Nebraska), August 19, 1975), particularly in the area of arms negotiations. Some of these hardliners were

---

[294] *Firing Line*, PBS, January 5, 1972, p. 10 of transcript. In addition, in Instructional Dynamics Economics Cassette Tape 100 (May 31, 1972), Friedman expressed concern that, currently, it was likely that "the public reaction to any further military expenditures is negative."

longtime Republicans or Republican supporters. In this category, there were two, in particular, with whom Friedman was good friends. One of them, noted earlier in this chapter, was U.S. conservative columnist-publisher William Buckley, and another was Buckley's brother James, who in his capacity as a U.S. Senator from New York had opposed the Strategic Arms Limitation Treaty (SALT) agreement with the USSR that the Nixon Administration negotiated and that Congress approved 1972.

During 1972, Friedman also had occasion to have a dialogue with many neoconservatives, who were primarily Democrats or former Democrats.[295] The neoconservative movement, in common with longer-standing conservatives like the Buckley brothers, was very critical of the détente policies pursued by Kissinger, Nixon, and Ford. Conservatives and neoconservatives were, consequently, considerably aligned on matters of defense and foreign policy.

Friedman's growing reservations about Kissinger's superpower diplomacy had by 1976 led him to voice doubts about U.S. foreign and military policy in his *Newsweek* column. In what likely reflected, in part, his dialogues with neoconservatives, Friedman observed in his column that "[m]any experts believe that the Soviet Union is already militarily stronger than the U.S." (*Newsweek*, February 9, 1976.) A few months later, in sharp contrast to Kissinger's reference in 1973 to the Soviets as "our former adversaries" (*Time* magazine, July 30, 1973), Friedman bluntly referred to them as "our Communist enemies" (*Newsweek*, May 3, 1976). Friedman viewed the regional interventions made by the Soviet Union as part of a process that he described in the spring of 1976 as one in which the USSR was testing President Ford's resolve on the world stage (Feldberg, Jowell, and Mulholland, 1976, p. 44–45).

In the ongoing competition, a key issue beyond the matter of which countries had come into the Soviet orbit was that of the relative strength of the United States and the USSR as military superpowers. In this connection, a central part of the hardliner critique of Kissinger was that the steps that he and his subordinates took in their various negotiations with the USSR, especially those in the forum of the Strategic Arms Limitation Treaty (SALT) talks, were essentially confirming, and threatening to perpetuate, the United States' loss of clear-cut strategic (that is, intercontinental-weapon) nuclear superiority by conceding a numerical lead in certain aggregates of weapons, including missile numbers, to the Soviet Union.

[295] The occasion that led Friedman to his dialogue was soliciting comments on his paper "Capitalism and the Jews." Friedman later recalled that the comments on this paper had come from those who became "among the most prominent neoconservatives." (From his August 1982 remarks in Elzinga, 1985, p. 459.)

In this respect, it is important to note that, even though some of the neoconservatives (such as Eugene Rostow) had been officials in the 1960s Democratic administrations, the critique made by defense hardliners of the détente policy was one that encompassed 1960s and 1970s defense procurement and foreign policy decisions and did not pertain solely to the policy actions initiated by Kissinger. Notwithstanding the change in U.S. administration that occurred in 1969, the U.S. officialdom, and the defense and foreign policy circles generally, that, as discussed presently, underestimated the Soviet Union's nuclear buildup in the mid-1960s overlapped considerably—both in personnel and thinking—with the officialdom that negotiated arms-control agreements during (and after) the 1969−1977 Kissinger years in foreign policy. Correspondingly, both the 1960s Democratic administrations and the successor Republican administrations were accused by the hardline critics of underestimating the USSR's nuclear ambitions.

In particular, an issue that outside critics of the 1970s administrations stressed and on which they believed the 1970s administrations were too complacent—the loss of the U.S. nuclear-missile lead—had occurred during the 1960s. The Kennedy Administration had engaged in a major nuclear-missile construction program in the early 1960s in response to a perceived deficit in U.S. intercontinental missile numbers compared with the USSR fleet. But the near-simultaneous advent of satellite technology in the early 1960s would establish definitively that the USSR did not have large strategic nuclear missile numbers after all. And with the very sizable U.S. missile buildup already in motion, a period followed in which there was, as Lee (1977, p. 29) put it, a "widespread belief that the Soviets had opted out of the intercontinental missile competition" and the United States, not the Soviet Union, was regarded as poised to acquire a permanent nuclear lead.[296] Indeed, in a remark that would be continually hurled back at him in the 1970s and 1980s, Robert McNamara, Secretary of Defense in the Kennedy and Johnson Administrations, stated in 1965 that the Soviets "have decided that they lost the quantitative race and they are not seeking to engage us in that contest. It means there is no indication that the Soviets are seeking to develop a strategic nuclear force as large as ours…"[297]

Friedman himself had already expressed doubts during the 1960s about McNamara's record regarding choices on weapons procurement (Instructional Dynamics Economics Cassette Tape 10, January 1969). These doubts would have been reinforced when, as seems likely, Friedman became familiar with some of the many 1970s critiques penned by hardliners of McNamara's

[296] Similarly, Wohlstetter (1977, p. 133) remarked: "It was common in and out of government through the mid-1960s to hold that the Soviets… would not try to catch up."
[297] Among the many quotations of this statement was that given by Graham (1979, p. 75).

projection of Soviet missile strength. For, in fact, contrary to McNamara's postulate about likely Soviet behavior, the USSR not only did endeavor to catch up in missile numbers—it also did, in fact, do so, by engaging in a large-scale missile buildup over the middle and late 1960s. Holloway (1970, p 11) observed: "The pace and scale of this deployment surprised many observers who had thought in 1964 that the Soviet Union might be prepared to accept a position of strategic inferiority rather than incur the enormous costs of such a buildup." Contrary to initial administration expectations, the USSR built up its land-based strategic nuclear fleet of intercontinental ballistic missiles (ICBMs) during the 1960s on a scale that matched the American deployment. Ultimately, in fact, the Soviet Union's land-based missile silos were in excess of the U.S. total: by 1971, the Soviet Union had deployed over 1500 land-based intercontinental ballistic missiles (ICBMs), surpassing the size of the U.S. fleet, which had leveled off in the late 1960s at 1,054 missiles (Miller, 1982, p. 292; Zaloga, 2002, p. 241).

A parallel with the Keynesian-monetarist debate

In light especially of this development, and U.S. policymakers' acquiescence to it in the SALT agreement of 1972, the U.S. government perspective on USSR strategic power and how American diplomatic and defense policies should respond to it were subject to withering criticism during the 1970s on the part of hardliners outside the administration. The parallel between this critique of U.S. national defense policy that a group of individuals outside the administration made and the monetarist critique of U.S. economic policy in the 1960s and 1970s was not lost on Lawrence Freedman (1982, p. 41), who observed that "arms controllers appear as the Keynesians of strategic studies, accused of misguided idealism… In the dock some plead guilty and promise that they are now reformed characters… while others merely look crestfallen[,] wondering where it all went wrong."

The parallel is reinforced by the fact that, as already stressed, defense hardliners' criticism of Kissinger in the 1970s on the subject of the U.S.-USSR strategic competition focused largely on elements of commonality between U.S. government thinking on superpower relations between the 1960s and the 1970s.[298] In a parallel vein, monetarists applied similar criticisms to the macroeconomic policies of the Kennedy-Johnson administrations and to the 1971−1974, post-U-turn, Nixon Administration as well as to the Federal Reserve of both eras. And Friedman and other monetarists found plenty of fault with inflation policy in the Ford era, too, because,

[298] As noted, there was commonality despite the fact that the Democratic administration of 1961−1969 was one to which Kissinger was opposed in the presidential campaigns of 1964 and 1968.

notwithstanding the presence of such Friedman admirers as Alan Greenspan and William Simon in senior economic positions, nonmonetary interpretations of, and approaches to, inflation continued to emanate from the president and various other administration officials over 1974–1977, as was discussed in Chapters 3 and 5. Crucially, too, the nonmonetary view of inflation was expounded throughout the Ford years by the Federal Reserve leadership, thanks in large part to the continuation of Arthur Burns as the central bank's head.

In pursuing further this parallel between monetarists' criticism of U.S. economic policy and hardliners' criticism of U.S. foreign policy, it is straightforward to discern a very specific similarity between the two debates: that between the U.S. intelligence authorities' protracted underestimation of the USSR's missile buildup in the 1960s and 1970s and the U.S. economic authorities' long-lasting overestimation of potential output (and underestimation of excess demand) in the same decades. Even the terms in which these errors were described—although taking place in different social-science literatures—exhibited similarities in wording.

Simple juxtapositions of quotations from the two literatures—those of monetary economics and of strategic or defense studies—bear this out. For example, in the defense literature, Wohlstetter (1975, pp. 170, 179) observed: "For over a decade, beginning in the early 1960s, we [in the United States] systematically expected the Soviets to deploy fewer offense vehicles than they did… [W]e systematically underestimated the Soviet buildup." In the economic-research literature, Orphanides, Porter, Reifschneider, Tetlow, and Finan (2000, p. 119): "the output gap as measured recently lies almost uniformly above the contemporaneous estimates: The real-time estimates of potential output over this period were systematically overly optimistic." Again, in the defense literature, Luttwak (1985, p. 215) referred to "the systematic underestimation of the Soviet ICBM force from the mid-1960s onward, and Daniel O. Graham observed in mid-1975: "during the time period our projections were consistently underestimations of the Soviet effort."[299] In the economic-research literature, Woodford (2003, p. 93) noted the "systematic overestimation" of potential output in the 1960s and 1970s. A final comparison: In the defense literature, Wohlstetter (1977, pp. 124, 127) stated: "Our longer-term predictions about the Soviet strategic triad were under the mark for eleven years… [A] study of differences between predicted and actual number of [USSR] silos suggests both underestimation and *increasing* underestimation." Correspondingly, Orphanides (2000, p. 14) observed: "Comparing the real-time and original series on the output gap reveals systematic one-sided measurement errors."

[299] Testimony of July 21, 1975, in Joint Economic Committee, U.S. Congress (1975h, p. 97).

Orphanides (2000, p. 14) added that "error in the measurement of the output gap, although already substantial at the beginning of the sample in 1965, worsened significantly during the early and mid-1970s before gradually improving later on."[300] This is one respect in which the parallel between the two branches of systematic errors (in USSR missile buildups, on the one hand, and in U.S. output gaps, on the other) breaks down. Whereas U.S. government misestimates of potential output built up further after the early 1970s, the corresponding official misestimates of the Soviet missile fleet came to an end with the SALT agreement of 1972, under which both the United States and the Soviet Union agreed to numerical limits on their missile deployments. The particular agreement was for each side to hold their missile deployment at the levels reached in 1972. This was, as chief U.S. SALT negotiator Gerard Smith would recall, "the so-called freeze of 1972."[301] To the economics profession, the "freeze" of the early 1970s referred to either the Nixon wage-and-price freeze of August 1971 or to the attempted price freeze of 1973. To those in the strategic world, however, the freeze referred to the missile-number caps imposed on the superpowers by the 1972 SALT agreement.

Being a freeze, the SALT agreement that Kissinger and his team negotiated was a ratification of the existing situation, and so it confirmed the USSR's lead in missile numbers. The agreement set a ceiling on each sides' deployed ICBM fleet—of 1618 missiles for the USSR and of 1054 for the United States—and imposed maxima of submarine-launched ballistic missiles of 950 for the Soviet Union and 710 for the United States, along with other conditions (Committee on Foreign Relations, U.S. Senate, 1979c, p. 106; Miller, 1982, pp. 177−179). Friedman's off-the-cuff reaction to this corresponded to a common response in the United States to the headline numbers: they seemed "on the surface to permit Russia a superiority in both land-based and submarine-based missiles" (Instructional Dynamics Economics Cassette Tape 100, May 31, 1972).

Advocates of the SALT agreement could point out that the United States had a heavy lead in strategic aircraft (nuclear bombers capable of intercontinental delivery), which were not covered by the 1972 restrictions. They could also highlight the fact that the United States had a wide lead in technology as well as a large numerical advantage in the number of missile warheads. But concern remained that the technological and warhead leads might prove ephemeral. In the event, the number of warheads in the USSR arsenal did eventually largely catch up with the United States' total, even when bombers were included in the comparisons (see, for example, *Financial*

[300] See also Orphanides (2003, p. 644).
[301] Testimony of July 16, 1979, in Committee on Foreign Relations, U.S. Senate (1979b, p. 29).

Times (London), November 1, 1985; *Durham Morning Herald* (South Carolina), November 14, 1985). In technology, however, it continued to lag badly. Friedman's longstanding position that the Soviet system was not well positioned to adapt and innovate proved correct.

Hardliners' negative verdict on the details of the administration's arms agreements in the 1970s was accompanied by a more general critique of doctrine underlying policy and the attributions—in the hardliners' view, mistaken and overly benign—it made to Soviet military ambitions. Secretary of Defense McNamara had in the mid-1960s adopted an assured-destruction nuclear strategy under which nuclear war would be deterred by the knowledge on both sides that neither could win a war—rather, it would lead to unacceptable damage to both combatants (see, for example, Ball, 1980, pp. 179, 201; Freedman, 1981, pp. 245–248).

This strategy, expounded by McNamara and widely viewed as also underlying Kissinger's negotiations, was one in which both sides were assumed to subscribe to a doctrine of mutual destruction or mutual deterrence. That is, both sides were ascribed the view that nuclear missile buildups were not made with the aim of maintaining a state of stalemate between the two sides—and not of improving their own side's chances of military victory. Despite some heterogeneity of views within the U.S. government over the 1970s, this doctrine remained that governing U.S. arms negotiations in the 1970s. In contrast, hardliners questioned both whether the USSR should accept the mutual-destruction doctrine and whether it was wise for the United States to use it in its own strategy. Doubts about the mutual-destruction doctrine were expounded not only by neoconservatives but also by some other defense specialists—including Friedman's former University of Chicago departmental colleague, Martin Bailey (1972).

This is not a dispute on which Friedman dwelled during his years at the University of Chicago. Indeed, he had himself in the early 1960s taken for granted that nuclear war with the Soviet Union was synonymous with the destruction of the United States.[302] In the 1980s, however, now stationed at a body—the Hoover Institution—that had many foreign policy and defense experts of the hardline persuasion, Friedman became more interested in, and somewhat sympathetic toward, notions that nuclear war was something for which preparation was needed by defense planners rather than an event that would quickly lead to global destruction.[303]

[302] See Friedman (1962a, p. 201).
[303] See Chapter 15 below.

Splits with neoconservatives on economics

Neither in his late University of Chicago years nor in his time from 1977 at the Hoover Institution did Friedman did not fall into line with neoconservatives and other defense hardliners on all their assessments of the Soviet Union and its competition with the United States. Indeed, he made clear that, in important respects, those critics shared the fault he attributed to their frequent target, Henry Kissinger, of being poor on economics. Even in August 1982, by which time many neoconservatives' positions on economics had moved considerably toward his own, Friedman still maintained: "I do not regard the neoconservatives as defenders of free markets. We must be very careful to distinguish [views on] foreign policy aspects from [those on] domestic policy aspects."[304]

These 1982 remarks were in part informed by Friedman's experience in the 1970s, when he had a low estimation of the economic understanding of the prominent neoconservatives. Perhaps most notably, Senator Henry Jackson was a major early neoconservative politician. Friedman's disdainful verdict on Jackson's economic views was analyzed in the previous chapter.

Friedman had even less occasion to be impressed by an economic proposition offered by the fringe of hardliners. Notably, a book-length critique of Kissinger coauthored by conservative activist Phyllis Schlafly suggested that the 1972−1974 commodity price explosion (and so, went the logic of these critics, the breakout in U.S. inflation after 1972) reflected the successful execution of a Soviet Union plan, which its improved strategic arsenal allegedly allowed it to carry out with impunity (see Schlafly and Ward 1975, pp. 605−607). The implication was that the USSR was masterminding Western economic difficulties, including high inflation, in conjunction with its efforts in negotiations with Kissinger to consolidate military advantages. To Friedman, in contrast, it was misguided to think that world commodity prices could be steered by the Soviet government. And, of course, he in any event regarded it as poor economics to attribute inflation in the United States and its allies to the rise in commodity prices.

A number of other hardliners had more gravitas than Schlafly in public debate but also made economic prescriptions and diagnoses with which Friedman sharply parted company. A call that frequently emanated from hardliners was for trade restrictions to be made a weapon against the USSR. Some hardliners favored a full-scale embargo, while many others sought to make freer

---

[304] In Elzinga (1985, p. 55).

U.S.-USSR trade conditional of changes in the Soviet Union's internal or foreign policies. In particular, Senator Jackson was a major force in Congress' decision, discussed above, to link U.S. conferral of MFN on the USSR to specific undertakings by the Soviet Union regarding its own policies outside the area of trade. In contrast, as earlier noted, Friedman favored normal trade relations with the Soviet Union, limiting his opposition to trade to the narrow area of U.S. export of strategic technology.[305]

Friedman also disagreed with numerous defense hardliners on the sources of strength in the U.S. economy. For example, retired U.S. colonel R.D. Heinl Jr. granted (*New Hampshire Sunday News* (Manchester), May 3, 1970) that "the Russians have a gross national product less than half of ours" but qualified this by saying that U.S. GNP "includes such frivolities as the production value of Cadillac tail-fins." Similarly, neoconservative Richard Pipes (1976, p. 21) suggested: "Consumerism… leads to a decline in public spirit and an addiction to comfort that significantly diminishes the state's ability to mobilize the citizenry." In contrast, Friedman regarded the existence of consumer sovereignty in a market economy as a sign of strength. This was especially the case because the associated higher degree of productive efficiency raised total national output and so made any given defense effort a smaller strain on a country's resources.

Warren Nutter's critique of Kissinger

One foreign policy hardliner whose economic analysis Friedman did rate very highly was his first-ever Ph.D. student, Warren Nutter. The two of them had already, in the late 1950s through the mid-1960s, they had been on the same in the public debate on Soviet economic strength: both had been on the—ultimately successful—side of the debate that maintained that the USSR economy lacked dynamism.[306] By 1975, Nutter was more specifically focused on foreign policy issues. Nutter had behind him a spell (1969–1972) as an Assistant Secretary of Defense in the

[305] Some defense hardliners shared Friedman's view that trade with the Soviet Union should be normalized, other than exports specifically of military significance. Notably, former Ambassador to the USSR, Foy Kohler, remarked in August 1977 that "unquestionably it is essential that we do not give them technology that really would step up the military-industrial sector of their economy… I personally would like to see normal trade with the Soviet Union but I see no reason… [for] those massive credits that certainly Brezhnev had in mind and sometimes, at least, Nixon seemed to be voicing [support for].") (In American Bar Association, 1978, p. 10.) Similarly, earlier, in testimony in Committee on Foreign Affairs, U.S. House of Representatives (1974, p. 89), Kohler had stated that he supported USSR trade with the United States on the same terms as, but no better terms than, those applying to other U.S. trading partners. In addition, history professor Walter Laqueur, invited by Senator Henry Jackson to testify before what was essentially an anti-détente Congressional hearing on April 17, 1973, had earlier observed: "I don't think that the West should indirectly subsidize the Soviet defense budget [but] it should have trade with the Soviet Union." (In Committee on Government Operations, U.S. Senate, 1973, p. 21.)
[306] See Nelson (2023) for a detailed discussion.

Nixon Administration, and he regarded military developments both during and after his time in government with alarm. He was critical of U.S. conduct of the Vietnam War—blaming both the administration and Congress for what Nutter considered a sustainable stalemate embedded in the 1973 settlement.

Nutter, like Friedman, had been disaffected with official U.S. policy in this area in part by the change in the situation in Vietnam from negotiated settlement in 1973 to Communist victory in 1975. Nutter saw the lack of sizable Congressional support after 1973 as partly responsible for this outcome: he had been one of those unsuccessfully trying to secure financial support for the anti-Communist forces in the leadup to the fall of Saigon (Committee on Appropriations, U.S. House of Representatives, 1975, pp. 45, 73–74). But, like Friedman, he also blamed Kissinger and the administration for the April 1975 outcome and, in Nutter's case, his disillusionment was magnified by his own having been a member of the first Nixon administration. Nevertheless, in his book on Kissinger, Nutter's focus was not the Vietnam War but instead the overall U.S.-USSR world power balance—including the content of the nuclear agreements that Kissinger had negotiated with the Soviet Union.

In his critique of Kissinger, Nutter (1975, p. 23) passed a negative judgment on the SALT agreement, contending that it allowed "a sizable expansion of the Soviet arsenal." Furthermore, on the basis of a comparison of Kissinger's pre-1969 writings as an academic with the policies he propounded as a member of the Nixon and Ford Administrations, Nutter (1975, p. 12) argued: "Secretary Kissinger hails agreements that Professor Kissinger would have strenuously opposed."[307] Friedman's negative verdict on U.S. foreign policy of the mid-1970s was likely reinforced by the Nutter analysis.

Venturing into foreign policy commentary in ***Newsweek***

Friedman had remarked in early 1972: "I have no competence in the area of international affairs… which is why I've been keeping quiet about it."[308] This was a sensible self-denying ordinance. And, certainly, various statements that Friedman made in later years seemed to reaffirm it. In April 1975, for example, Friedman told a journalist that, because he was "not a

---

[307] There had, of course, been previous analyses contrasting Kissinger's position after 1969 and the points of view expressed in his pre-1969 writings, including one in *Commentary* magazine (June 1974).

[308] *Firing Line*, PBS, January 7, 1972, p. 7 of transcript. (The transcript used "confidence" instead of "competence," but the latter word makes more sense in context and would be in line with Friedman's way of speaking.)

political expert," he would bypass the journalist's questions about how a Third World War figured as an eventuality.[309] In a 1976 interview (Rogge, 1976, p. 3), he stated that he did not think it was appropriate to comment publicly regarding topics on which he was not expert. And, in the spring of 1977, Friedman seemed to be conscious of the potential harm that such commentary could do to one's own standing, as he observed that the recent writings of neoconservative Irving Kristol on economics had started to undercut Friedman's confidence in the reliability of Kristol's statements on other topics (Instructional Dynamics Economics Cassette Tape 213, May 11, 1977).

Nevertheless, in 1976, in particular, but also in late 1977, Friedman went against the spirit of these injunctions, by producing commentaries, most notably in *Newsweek*, that dealt specifically with the foreign affairs of the United States. In a kind of parallel to Henry Kissinger's ill-fated ventures in 1974 and 1975 into U.S. economic policy, Friedman made forays into geopolitical punditry. The most sustained series of commentaries appeared in the second half of the spring of 1976. They were poorly judged and confirmed Friedman's status as a novice in the foreign policy field.[310]

In April-May 1976, after making trips in April to the minority-rule states of Rhodesia and South Africa, Friedman discussed the United States' approach to these countries. His various commentaries in this area—appearing in *Newsweek* columns (May 3 and 24, 1976), his audiotape series (Instructional Dynamics Economics Cassette Tape 189, April 1976), and on *CBS Morning News* (April 29, 1976) would do him little credit.

In his cassette commentary, he stressed the degree to which the private enterprise had provided a means by which South Africa's different races had worked together to build the economy—a perspective that definitely underplayed the extent to which South Africa's legal system restricted opportunities of the Black majority in the private sector and public sector alike. In his column on South Africa, Friedman opened by noting his continuing "abhorrence of the apartheid policies" practiced in that country. But he went on to catalogue the similarities between South Africa and the United States. In doing so, Friedman intended this to underline the need for a deeper appreciation of South Africa's situation. But taking this tack in his commentary could also easily have been interpreted as neglecting the great dissimilarity between the two countries that lay in the fact of minority rule in South Africa. In his CBS television commentary, Friedman pushed

[309] See Friedman (1975g, p. 11).
[310] Friedman's columns on South Africa would be sharply criticized by Rayack (1987, pp. 177–178).

the tenuous parallels even further, asserting, "Neither Rhodesia nor South Africa is an ideal democracy, just as we are not."[311]

In putting undemocratic countries like Rhodesia and South Africa on the same footing as the universal-franchise United States, Friedman was putting his own country in a bad light. Parallels between the United States and South Africa or Rhodesia of this kind were more associated with radical critics of the United States. The superficial comparisons that he made underlined the fact that Friedman was better suited to talking about Adam Smith rather than Ian Smith.

The foreign policy scenario that Friedman evoked in his foreign-policy-centered columns on the minority-rule southern African countries was that sanctions might "drive [them] into the arms of the Soviet Union" (*Newsweek*, May 24, 1976). He was particularly fixated on this possibility with regard to South Africa and focused on it not only in a 1976 column but also in a follow-up column, "South African Nightmare" that appeared in the first year of the Carter Administration (November 28, 1977). Angola had become a Soviet Union-dominated government in 1975, and Friedman suggested in the 1976 column that Kissinger had "learned nothing from Vietnam or Angola" (*Newsweek*, May 24, 1976) in the Soviet Union acquiring client states. In contrast to the cases of Vietnam and Angola, in which the USSR acquired satellites in the wake of military conflict, Friedman suggested that economic sanctions imposed by the West might prompt the apartheid government to form a voluntary alliance with the USSR. This far-fetched speculation was an example of what Hirsch and de Marchi (1990, p. 66) perceptively described, in another connection, of times when his appetite for debate "tempted Friedman into areas where he was not an expert." Friedman was now breaking the dictum that one should stick to talking about things that one knew about: he was devoting what was ostensibly an economics column to a foreign policy subject. Friedman was trying his hand at assessing the state of world affairs—and the commentaries that resulted from this attempt were not impressive.[312]

The basic position that Friedman took when discussing southern Africa was in keeping with a general reluctance—voiced previously in his opposition to limitations on U.S.-USSR trade, as discussed above—to use controls on trade, capital, and travel as weapons against countries whose policies the United States opposed. Friedman's basic position on southern Africa was

---

[311] *CBS Morning News*, April 29, 1976, p. 7 of transcript.
[312] Friedman's thoughts on South Africa and the USSR were, however, taken sufficiently seriously by some defense specialists for his *Newsweek* column on the subject to be cited in the lead article of the 1977 edition of the prestigious readings collection *American Defense Policy*. See Pfaltzgraff (1977, p. 16).

also not unlike that taken by a variety of critics of the Ford Administration foreign policy on the Republican side, including Ronald Reagan.[313] Like Reagan, Friedman expressed the concern that the regime to which minority rule could give way would not be one practicing pluralistic democracy in the context of a market economy but, instead, a collectivist state. This fear was not altogether unfounded, as the subsequent case of Zimbabwe showed, although it proved far too pessimistic, indeed completely off base, with respect to South Africa.

But the question remains why Friedman felt qualified to write about these issues in the first place. A number of factors likely played a part. First, his very recent trips to southern Africa made him feel inclined to comment, even though his main television and magazine outlets had been given to him on account of his economic expertise and had not been envisioned as a vehicle for general foreign affairs commentary. Second—and a matter closer to his economic expertise—he had a strong dislike of economic sanctions, as already stressed. Third, Friedman likely felt that concern about the threat of world Communism had faded too much in recent years in the United States. He had called Marxists "the most extreme opponents of our system" in the original write-up of his Price Theory lectures in 1951—and he continued to use that description a quarter century later, in the revised edition of his *Price Theory* text.[314]

Some years before his 1976 visit to the area, Friedman had taken a degree of interest in the economics and politics of southern Africa, and he had raised the subject with his Rhodesia-born departmental colleague Stanley Fischer. Fischer found Friedman highly ill-informed on the subject. "Milton didn't know where I was from, and we were walking along. And he was busy expounding to me on South Africa and Rhodesia." Fischer's judgment on what Friedman had to say on this topic was: "Absolute crap." Fischer assessed that, on issues like this, Friedman picked up pieces of information from various sources and then followed an unfortunate practice in which "he chanced his arm on playing facts" by generalizing from the impressionistic and anecdotal evidence to which he had been exposed (Stanley Fischer, interview, August 30, 2013).

This occasion had been one of private conversation, but during the same period of the early 1970s it had also been observed (*Financial Times* (London), September 17, 1970) that Friedman was willing to talk publicly on matters beyond economics. For the most part, however, these interventions had involved the application of economic principles to areas of social policy

[313] See, for example, Reagan's radio commentary dated July 6, 1977, in Skinner, A.G. Anderson, and M. Anderson (2001, pp. 185–186).

[314] See Friedman (1951c, p. 72; 1976b, p. 199).

closely intertwined with economics or had considered aspects of defense or foreign policy that were amenable to economic analysis. His critiques of the draft and of trade sanctions were examples of his cross-disciplinary interventions. In contrast, when Friedman was emboldened by his 1976 visit to southern Africa to talk publicly about that subject, he was really venturing into geopolitics.

This was not his forte. With regard to political, cultural, and constitutional matters outside the United States, Friedman had little experience and, often, only superficial knowledge. Continental Europe was, as discussed in other chapters, one example of the limitations of his knowledge. Africa was another. His commentaries on South Africa exemplified this fact. Friedman's experience in news commentary and his extensive travels probably made him overconfident of his ability to speak authoritatively on world affairs. Instead of being authoritative, however, Friedman's foreign policy commentaries in the mid-1970s provided a demonstration of a statement he had made in another context: "I do not know that I have any insights, but I have opinions."[315]

The Soviet Union's combination of military strength and economic weakness

The reservations that Friedman expressed in the mid-1970s about the East-West military balance were contributions that dated better than his speculations about southern Africa. In talking about the global balance of power, he was correct in suggesting that Soviet military strength was expanding while U.S. defense spending was declining. And he was on the right track in the general point, though not in the specific examples he chose, in implying that the USSR was, during the 1970s, trying to expand its empire, notably in the Third World. The fact that these points, associated with hardliners in the era of détente, became more widely accepted after the mid-1970s in U.S. political discourse was reflected in the trajectory of U.S. military spending, which troughed in 1976 and expanded strongly from 1980 onward under Presidents Carter and Reagan.

An aspect of Friedman's perspective on the Soviet Union that also did him more credit in retrospect was that the fact, for all his concern about the geopolitical advances of the USSR, he repeatedly took heart in the United States' clear-cut economic advantages over the Soviet system. In the late 1950s through the mid-1960s, Friedman and Warren Nutter had been isolated

[315] Testimony of June 21, 1973, in Joint Economic Committee, U.S. Congress (1973, p. 139).

in stressing Soviet economic weakness. By the 1970s, in contrast, that perspective had become widely accepted.[316] The weakness of the level and growth rate of Soviet productivity had become increasingly recognized after the mid-1960s, and the fillip that the oil shock gave to the oil-exporting Soviet Union did not materially reverse the economic fortunes of the USSR or the East bloc.

The bad USSR economy, reinforced by the inflexibility of the Soviet government on domestic economic matters, would prove to be a trump card for the United States in the global competition by the early 1980s. In the intermediate period of the 1970s, however, the USSR's chronic economic problems coexisted with growing Soviet military strength.

Nevertheless, the worst-case scenarios sketched by Friedman, as well as of defense hardliners, in which the USSR became dominant outside Eastern Europe, did not materialize. Soviet dominion in Western Europe or in more of Asia was, in the event, avoided. The avoidance of this outcome in part likely reflected the compensating policy changes in the United States. But it may also have reflected hardliners simply being too dire in their assessments during the 1970s of the shift in the military balance between the USA and the USSR, as well as of the Soviet Union's likelihood of success in acquiring new client states.

The fact that the USSR's internal economic management was producing and guaranteeing the country's underlying weakness was one reason why Friedman was unenthusiastic about the use of economic or financial sanctions as a U.S. government weapon against the USSR or the East bloc. After 1982, the policies of the Reagan Administration largely refrained from such sanctions. On that score, the administration followed an approach that was closer to Friedman's prescriptions than it was to that prescribed by many neoconservatives.[317]

Confirming the intrinsic economic weaknesses associated with a planned economic system, the Soviet bloc would ultimately collapse, even in the absence of the systematic use of sanctions against it. As already noted, Friedman and Warren Nutter had stressed these weaknesses in 1956–1965, challenging the consensus of that period (a consensus later characterized as one in which "the Soviet Union was widely portrayed as 'ten feet tall'").[318] Although they had not claimed that this weakness was inevitably terminal for the bloc, their basic message that the East

[317] See Chapter 15 below.
[318] Schroeder (1991, p. 92).

bloc economies were intractably stagnant became an ever more widely accepted characteristic of the European Communist economies, and particularly of the USSR, in Western analysis during the 1960s and 1970s.

The contrast between Soviet superpower status in the military field and its serious weakness on the dimension of domestic economic performance would be highlighted in the retrospective given by Michael Mussa in 2000, when he noted that "for forty-five years, the Soviet Union maintained effective control over most of central and eastern Europe," only to add: "But, under the stress of economic stagnation… this empire collapsed… and by 1992, the Soviet state split apart into politically independent republics."[319]

MICHAEL MUSSA

By the time he wrote these words, Michael Mussa, as chief economist and director of research at the International Monetary Fund, had been deeply involved for a decade in matters concerning Eastern Europe and Russia, as part of the process of integration of the former East bloc countries into the international economic system and their transition to market economies.[320]

The IMF years were Mussa's second spell working in the official sector. He had previously served as a consultant to, and then a member of, the Council of Economic Advisers for nearly three years of the second Reagan term.[321] These experiences had been preceded by a couple of decades as a graduate student and then teacher-researcher at academic institutions—mostly the University of Chicago.

Although Mussa did not receive his Ph.D. until 1974, his time as an on-campus graduate economics student had been much earlier—September 1966 to June 1971 (see Committee on Banking, Housing, and Urban Affairs, U.S. Senate, 1986, p. 62)—a period covering the heyday of increasing attention to Milton Friedman in national and international discussions of monetary policy. Mussa did not have Friedman on his dissertation committee. But his thesis—subsequently developed into book form as Mussa (1976a)—concerned domestic macroeconomic

[319] Mussa (2000, pp. 48–49).
[320] Kose, Prasad, and Terrones (2005, p. 31) noted that Mussa had served "at the Fund during the trying periods of the Asian and Russian crises" of the late 1990s.
[321] Mussa began as a consultant to the CEA in October 1985 (Committee on Banking, Housing, and Urban Affairs, U.S. Senate, 1986, p. 64). He then served as a member of the CEA from August 18, 1986, to September 19, 1988 (see *https://obamawhitehouse.archives.gov/administration/eop/cea/about/Former-Members*).

dynamics and cited a good amount of Friedman's work.[322]

A more momentous link between Friedman and Mussa would, however, come a little later, when their careers met at a tangent. Having been teaching at the University of Rochester, Mussa officially joined (as an associate professor) the University of Chicago on January 1, 1977.[323] This was exactly the same day on which Friedman ceased working at the university.

Although Friedman was leaving the university's economics department and Mussa was joining the business school, the synchronicity of Friedman's departure and Mussa's arrival was notable for its symbolism. Mussa's start-of-1977 arrival as a new University of Chicago was a prime example of the generational change underway in monetary economics at the institution. Just as Mussa was arriving, Friedman was exiting, after having been based at the University of Chicago for almost all of Mussa's lifetime: Mussa was born in April 1944, only a couple of years before Friedman assumed the position of associate professor of economics at the university.

Furthermore, as discussed below, Mussa was an important example of an economist whose approach to monetary analysis reflected, to a considerable degree, the heritage of Friedman's work in the area. In particular, in contrast to the flexible-price-based approach to inflation/output dynamics favored by a number of his University of Chicago colleagues in the late 1970s, Mussa advocated a focus on sticky prices that broadly coincided with Friedman's perspective and that anticipated the New Keynesian consensus that would characterize professional views on inflation in later decades.

Culmination of Friedman's years at the University of Chicago

Friedman had already decided by 1974 to leave the University of Chicago in the 1976/1977 year: "In three years Friedman will retire," a profile of him had noted (*Miami Herald*, November 24, 1974, p. 2F). In the event, the actual timing of his departure proved to be closer to two years after these words appeared. Friedman's presence at the university in the 1976/1977 academic

---

[322] Specifically, Friedman (1956, 1957a, 1969a, 1970a): see Mussa (1976a, p. 306). The thesis was titled "A Metzleric Model of Macroeconomic Dynamics," and the book was an "extension" of the thesis (Mussa, 1976a, p. vii).
[323] See Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1986, p. 63). His later title at the university was the William H. Abbott professor of international business, Graduate School of Business (Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives, 1984, p. III). He had become a full professor in 1980 (Committee on Banking, Housing, and Urban Affairs, U.S. Senate, 1986, p. 75).

year was curtailed by his taking leave in the second half of that year (in order to undertake activities on the West Coast and elsewhere that will be discussed in the next chapter).

The plan to leave the University of Chicago in 1976/1977 roughly corresponded to Friedman reaching the age of 65 (which Friedman would attain on July 31, 1977)—widely regarded at the time as a point at which economics professors usually moved to emeritus status. The Friedmans also, over the years, repeatedly gave a second reason for his departure: stepping away from the grading of exams and term papers.

These cited reasons for Milton Friedman's end as a University of Chicago teacher were, however, somewhat pat. For one thing, if it was really the case that age 65 was a wholly mandatory retirement age, then avoiding grading could not be legitimately cited as another reason for his retirement. In fact, reaching age 65 did not invariably mandate retirement. And as for grading, Friedman had the option of delegating this task, had he so desired.

Having been present when Friedman "expressed himself on the subject [of grading] more than once," Al Harberger's view was that things might have been different if Friedman had really viewed an arrangement not being involved in grading as viable: "if he had been able to continue teaching and not have to grade exams… he might have stayed on longer." (Arnold Harberger, interview, April 12, 2013.) Nevertheless, asked further about Friedman's reasons for leaving, Harberger cited as the central factor the wishes of Rose Friedman.[324] "Oh, I'm sure that the grading wasn't the only thing—though I'd say if you asked him what he was complaining about, it was that this was something that got under his skin a bit. But no, I don't think [it was decisive]. If I had to make a bet, I think Rose had a lot to do with the decision to go to California." (Arnold Harberger, interview, December 9, 2013.)

Rose Friedman's retrospective in 1998 appealed to the usually cited reasons: "We finally moved to San Francisco in 1977—although I cannot claim that it was because of my persuasive power. Milton had reached the age of retirement and was very tired of grading exam papers."[325] But in another 1990s-vintage account, Milton Friedman gave Rose's wishes a more prominent role: "When I reached the age of 65—I was, at that time, living in Chicago and teaching in Chicago—I decided I had graded all the exam papers I was going to grade. My wife grew up in Portland, Oregon, and she was in love with San Francisco. She tried to move us out here many times

[324] This was also the driver of the Friedmans' move cited in a profile in *Rutgers* magazine (Fall 2006, p. 27).
[325] R.D. Friedman (1998, p. 140).

during our life together, but she never succeeded until I decided I was going to retire from active teaching. Fortunately, the Hoover Institution at Stanford University offered me the opportunity to be a [research] fellow…"[326]

Robert Lucas indicated that "later on, I learned that there was some agreement between him and Rose that, after [he turned] 65, they were moving. I think Rose felt she had had enough of Hyde Park." (Robert Lucas, interview, March 12, 2013.) That Rose Friedman wanted to move to San Francisco was undisputed. "I love San Francisco," she would remark. "It's my favorite city." (*Straits Times* (Singapore), October 18, 1980.)

Milton Friedman would joke that, as the Bay Area was a key region of the United States in which public opinion traditionally strongly favored an interventionist public sector, San Francisco was an appropriate place to which to relocate, it being where the battle needed to be fought (*Rutgers* magazine, Fall 2006, p. 27). More seriously, he would cite a major attraction that the 1977 move had for him: "I could continue my research and writing, without doing any teaching."[327]

In this connection, it was especially significant that in December 1976, a few weeks before the relocation proceeded, Friedman indicated that, in the course of holding his University of Chicago position in recent times, he had been finding it harder to attain the tranquility most conducive to the activity of writing (*Chicago Daily News*, December 8, 1976).

There was some anticipation that Friedman's official retirement would be associated with a large step-down in his public profile. That was the expectation, or hope, expressed in a magazine that in the 1970s and 1980s tended to be one of Friedman's detractors: *Business Week*. Its reporter William Wolman wrote (in the edition of January 19, 1976) that "University of Rochester economist Karl Brunner… is likely to emerge as the leader of the monetarist school when Milton Friedman winds down his activities in retirement." Of course, Friedman's busy agenda in the decade after 1976 meant that the winding-down of his activities, as well as the ascendancy of Karl Brunner, that Wolman envisioned did not occur.

Closer to the mark than Wolman was a news item that gave a public airing to Friedman's post-University of Chicago plans. On Election Day 1976, it was announced that, starting in the

---

[327] CSPAN, November 20, 1994, p. 10 of transcript.

following year, Friedman would be Senior Research Fellow at the Hoover Institution, Stanford University—a position discussed in detail in the next chapter. The report (*The Detroit News*, November 3, 1976), after noting Friedman's projected responsibilities at the institution, observed with tongue in cheek: "Other than those assignments, writing his weekly [sic; every three weeks] column for *Newsweek* magazine, and scholarly journal and book writing, he'll be taking it easy."

Friedman could not, however, be affronted at perceptions of himself as being retired, because he would indeed describe his status in these terms—especially in the initial post-1976 period after his University of Chicago activities ended. It would soon become apparent, in the course of his blitz of media and other public-policy activities in the late 1970s, that this characterization had to be taken with a grain of salt. Samuel Brittan (2005, p. 298) instead captured Friedman's post-1976 life reasonably accurately as "a working retirement." But as Robert Lucas (personal communication, November 7, 2013) observed of Friedman: "He defined 'retirement' as never having to grade papers again."

Departure of a celebrity

Although Friedman was not intending to withdraw from economics or from public life, he was, indeed, leaving his traditional location. It was consequently the case that, with the close of 1976, the University of Chicago economics scene was losing its biggest name.

Those familiar with Friedman's schedule knew that, although he had become synonymous with the University of Chicago, he was not there half the time. Friedman had long absences thanks to his spending six months a year at the Friedmans' "Capitaf" second home in Ely, Vermont—what Paul Samuelson had jokingly called Friedman's "Vermont hideout" (*Washington Post*, August 1, 1971). And, over and above these regularly scheduled absences, during the part of the year in which he was nominally a presence on campus Friedman actually had frequent getaways for one-off trips—such as that involving the Wisconsin appearance discussed at the start of the chapter. These excursions were, however, often high-profile and had the effect of reinforcing the association in the public mind between Friedman and the university—a situation exemplified by another short trip, this one to Dallas on October 16, 1975. One of the press pieces on this trip referred to "the University of Chicago's ubiquitous economist, Dr. Milton Friedman," while also noting that "he's become regarded as something of an institution" (*Dallas Morning News*, October 17, 1975). Another wrote of "Dr. Milton Friedman, nationally known economist from the University of Chicago… the bald little man with the big smile" (*Dallas Times-Herald*,

October 17, 1975). As Phil Donahue said to Friedman in one of the latter's appearances on Donahue's Chicago-based, but nationally broadcast, program (*Donahue*, NBC, September 30, 1975), Friedman had become a household name. Correspondingly, an undergraduate monetary-economics textbook that appeared during Friedman's final calendar year at the university observed that "his utterances receive wide circulation in the press."[328]

Friedman's celebrity status therefore made him more closely associated with the university than one might have gleaned from the modest amount of time per year he actually spent on campus. That status also associated him with the university as a whole—a situation Friedman recognized when he made remarks to the press about the University of Chicago as an institution: "The university stands for academic excellence and intellectual independence." (*Chicago Daily News*, December 2, 1975, p. 6.) More specifically, Friedman's high profile made him, to many, the face of the overall economics scene at the University of Chicago, even though he was really a member of only one part of that scene—the economics department—and specialized in a field, monetary economics or business-cycle macroeconomics, different from that pursued by most of the other economic researchers at the university.

Friedman's ubiquity meant that, although he had had no affiliation with the institution—the business school—that Mussa would join, he was popularly associated with it. Charles Nelson, a member of the school from 1969 to 1975, recalled that a newspaper "ran an article about the University of Chicago's School of Business, and how it was up and coming, and, you know, a rising star, *et cetera*. And I think over half the article talked about Friedman, and it never mentioned the fact that Friedman never had any appointment whatsoever with the school. You know, they focused on the superstar, from their point of view. And Friedman certainly had an enormous impact on the whole place—and that umbrella covered the business school, as well." (Charles Nelson, interview, September 9, 2013.)

Friedman also had a definite impact on the undergraduate part of the university. He had not been involved in undergraduate economics teaching in the quarter century after the early 1950s.[329] But

---

[328] Thorn (1976, p. 257).

[329] William Dougan (interview, September 19, 2013) recalled, however, that Friedman did teach an undergraduate class in late 1976. Robert Lucas suggested that this may have been a not-for-grade course, possibly open to undergraduates, that he recalled Friedman teaching late in his stay at the university (Robert Lucas, personal communication, November 7, 2013).

The practice under which senior members of the University of Chicago's economics department did not teach undergraduate classes came as a letdown to some of the university's college students, who had expected to take classes taught by the most well-known department members, such as Friedman. "I think there were people who

Friedman was bound to have an impact on the undergraduate aspect of teaching at the university because of the detailed discussion of his work that took place in introductory texts and courses.[330]

Away from the references to his own work was treated, Friedman had by 1976 become interested in how the later nineteenth-century U.S. economy was treated in college and high school classes, including in history courses. He considered the period to have been one of considerable advance and was concerned that the courses, along with the media, had characterized the period as one in which the poor were made worse off (*Milwaukee Journal*, October 30, 1976).

As far as high school teaching of economics was concerned, Friedman's fame was also felt across the country: Gloria Valentine, Friedman's secretary at the University of Chicago in 1972–1976, found that some U.S. high school students, upon receiving class assignments that concerned Friedman's views, would take a shortcut in their research by phoning Friedman's office, asking to speak to him. Valentine, who was puzzled at the students' parents permitting their children to make long-distance phone calls of this kind, would rarely let the calls through, and she recalled reproaching some of the students for the familiarity that they assumed in referring to Friedman as "Milton" (Gloria Valentine, interview, April 1, 2013).

Ahead of his departure, Friedman participated in efforts to create a concrete legacy for himself at the University of Chicago and the economics department specifically. Plans were made for a "Dr. Milton Friedman Fund" to be provided to the department and intended to consist of a starting amount of $1 million. Risking appearing egotistical by soliciting donations to a fund that was named after himself, Friedman participated in events designed to raise the one million dollars, including the aforementioned talk in Dallas to a business audience (*Dallas Morning News*, October 17, 1975). The fund bearing Friedman's name went ahead but was low profile and proved to have a short life—petering out within a few years of his departure.

---

dropped out of the major, fairly quickly, when they realized that," Philip Meguire, who was an undergraduate economics student in the mid-1970s, observed (interview, November 18, 2013). For the most part, however, "we accepted it as a reality. And the instructors that we did have were not bad." Gary Becker noted (interview, December 13, 2013) that, "there were separate people, who were not members of the regular department, who taught economics undergrad. We didn't have a very extensive program." With regard to senioe members of the department, I, when I came in, never taught undergraduates, an undergraduate class at Chicago. Friedman never did, Stigler never did… Ted Schultz never did, maybe Gregg Lewis did, I don't remember, [but] many of the people never taught it. So it was very different in those days."

[330] The previous chapter discussed the treatment of Friedman's work in undergraduate economics texts.

The next generation

Friedman nonetheless left a major imprint on the post-1976 world of economic research at the University of Chicago. He achieved this mainly in the same way in which his influence was felt in the economics profession at large: through the significance and legacy of his contributions to economic analysis.

For reasons largely unrelated to 1976/1977 being his last teaching year, Friedman's work and career were the subject of many retrospectives in this period. Milton and Rose Friedman themselves produced some of them. Milton Friedman wrote for the *Journal of Monetary Economics*—a periodical that, as already noted, was launched in early 1975—an article (on Homer Jones) that, in part, reminisced about his undergraduate years and what brought him to the University of Chicago. Rose Friedman wrote a long (ultimately, fourteen-part) series of articles in 1976–1977 on her husband's life and career, as well as their collaboration, in the Japanese English-language periodical *The Oriental Economist*.

Before the *JME* article appeared (in the November 1976 issue) and during the publication of the *Oriental Economist* series, Friedman won the Nobel prize—and this, of course, gave rise to a large quantity of articles dealing with Friedman's career and contributions. Rose Friedman herself inserted an instalment specifically concerned with the Nobel award into her *Oriental Economist* series.

The younger generation of monetary economists would not have been able to read economics journals or economics coverage in the media in 1976 without coming across multiple retrospectives on Friedman's career.

A significant number of prominent members of this generation spent some of the 1970s at the University of Chicago. As already indicated, Michael Mussa was a leading example, joining the University of Chicago at exactly the point at which Friedman left, and having been previously on campus through mid-1971. But the intervening period of Friedman's 1971−1976 closing years at the university had also seen him overlap with many members of the new generation of contributors to monetary economics—a generation born after he started publishing economics articles in 1935. Several of these individuals had left the university in 1975 or earlier, thereby preceding Friedman's own departure: these included Robert Gordon (born 1940), Charles Nelson (born 1942), Stanley Fischer (born 1943), and Robert Barro (born 1944). Of this group, Barro

and Fischer made brief reappearances, following their departures from the university, at Friedman's money workshop, as guest speakers in talks held during 1976: Fischer to give his paper "Corporate Supply of Index Bonds" on February 17, 1976, and Barro to present "Money and Economic Activity in the United States since 1869" on May 11, 1976.[331]

A still-younger generation was present on the University of Chicago campus at the tailend of Friedman's time. Joining the business school at the start of the 1976/1977 academic year, and thus overlapping on the campus with Friedman for one academic quarter, was Frederic (Rick) Mishkin (born 1951). Although "I didn't get to know him because he was getting ready to leave" (Frederic Mishkin, interview, June 18, 2013), Mishkin did encounter Friedman during their brief crossover at the university over the second half of 1976. Most notably, on November 2, 1976, Mishkin—who would later recall that, as a graduate student, "a major intellectual influence on my thinking was Milton Friedman and Anna Schwartz's *A Monetary History of the United States*" (Mishkin, 2007a, p. ix)—gave a paper at a rowdy session of the money workshop. He found that Friedman was not well disposed at all toward the argument that Mishkin was advancing in the presentation.[332]

This was one of the very last workshop sessions presided over by Friedman. Before he left for Stockholm with Rose Friedman on December 6, 1976, there would be four remaining workshop sessions on his watch: Thomas C. Heagy's presentation of "The Long Term Demand for Money in the U.S.—A Time Series Approach" on November 9, 1976; Reuven Brenner's talk on "Indexing and the Source of Changes in the Price Level" on November 16, 1976; Friedman's own delivery of his draft Nobel lecture on November 23, 1976; and Allen Drazen's offering of his paper "Asset Holding in an Overlapping Generations Model" on November 30, 1976. The appendix to the present chapter contains further details on Friedman's money workshop in its later years.[333]

Also among the new economists at the business school, having joined it in 1975, was Roger Kormendi (born in 1949). Before drifting away from research in the mid-1980s, Kormendi would produce several articles in monetary economics, as well as research on fiscal policy that would provoke Franco Modigliani's wrath in the 1980s in a manner reminiscent of Modigliani's

---

[331] Information on workshop dates was obtained from the University of Chicago Library's archives.
[332] This had been issued as Mishkin (1976). For more details on this session, see Chapter 18 below.
[333] The Friedmans' arrival date in Stockholm was given in Friedman and Friedman (1998, p. 446−447) as the daytime of December 6, 1976.

reaction during the 1960s to the Friedman-Meiselman findings on fiscal policy. "Friedman last taught at Chicago the quarter he won the Nobel, one year after Roger started at Chicago," recalled Philip Meguire, who would be a student and longtime coauthor of Kormendi's. "They knew each other a tiny bit." (Philip Meguire, personal communication, April 29, 2011.)

Still another notable presence on the University of Chicago campus was someone who was visible to Friedman only as a face in the crowd but who would play a very major role in monetary economics in later years. Completing his undergraduate studies during Friedman's final years at the university, Michael Woodford (born 1955) was not majoring in economics but attended some of Friedman's 1975/1976 Price Theory graduate lectures out of curiosity (Michael Woodford, personal communication, November 6, 2013).

Friedman's teaching of Price Theory into 1976 reflected the anomaly—present through the mid-1960s and again a feature of the graduate school's teaching assignments since 1973—that he taught in an area different from the monetary field that had brought him national fame. Of course, originally his responsibility for teaching graduate price theory had not been an anomaly: microeconomics *had* been his main field when he started teaching at the university in 1946. And his contributions in this area during the later 1940s, especially those made in collaboration with L.J. Savage, had been the basis for his receipt of the Clark medal in 1951. The Friedman-Savage work on utility did still receive citations in the economic-research literature of the mid-1970s.[334] It was even mentioned in a *Business Week* article on gambling (August 4, 1975, p. 68). But it was Friedman's monetary research that was the overwhelming basis for his modern reputation in research and policy circles. It was this research on which the Nobel award was based, and it was Friedman's career since the late 1940s, focused on monetary analysis, rather than his whole career that was the grounds on which a 1976 textbook discussion noted: "He started his work amid ridicule and lived to see it become the leading rival of Keynesian economics."[335]

One of the oldest of the new generation of monetary economists, Robert Lucas (born 1937), was one of those who overlapped with Friedman in the University of Chicago's economics department in the last Friedman years: Lucas joined in 1974 as a visiting professor, with his appointment becoming permanent in 1975. Lucas was also one of those in his generation most

---

[334] Unusually, Friedman also permitted his money workshop to hold a session related to that research, when Benjamin Eden presented "Time Perspective in Behavior towards Risk and the Economics of Gambling" on April 8, 1975. This paper was also related to some of Friedman's monetary work of the time (Friedman, 1977b).
[335] Thorn (1976, p. 257).

associated with the challenge to Keynesian economics and, furthermore, Lucas' own work in this area built on Friedman's monetary contributions in important respects. Nevertheless, Lucas emphasized with respect to his own move to the university that "I was drawn more" by the presence of "good theorists" in the department (Robert Lucas, interview, March 12, 2013.)[336]

This was natural: Lucas' research, although related to Friedman's, included numerous technical contributions that Friedman likely never read. Such work was very far from what Friedman's approach to research had become: Dennis Robertson's (1954, p. 671) description of Friedman as one of the "eminent mathematical economists," while fairly accurate at the time when Robertson offered it, could not, by the mid-1970s, seriously be regarded as still applicable. "I didn't come here to work with Friedman," Lucas further recalled of his move to the University of Chicago (interview, March 12, 2013). "I knew I wasn't going to be collaborating with him or anything. But he was a hugely stimulating guy to have around—that's for sure."

Michael Mussa and price stickiness

In 1977, following Friedman's departure, Lucas would take over the overseeing of the money workshop. Even in Friedman's final five or six years of running the workshop, the content of the papers presented at the workshop had heavily reflected Lucas' impact on research. Friedman could take considerable consolation in the fact that—even though the rational expectations revolution of this period was putting much of the analytical modeling and data analysis in his published work even further behind best practice—the research that emerged from the revolution provided support for many specific theoretical and empirical positions that he had taken.[337]

In this connection, Edward C. Prescott observed that "Lucas' program to make economics dynamic—aggregate economics, using dynamic economic theory to model that: that was a revolution." Friedman's work preceded this revolution: "It was almost sad that he didn't have all the firepower, the tools that are needed." Prescott noted that, all the same, "Friedman came up smelling of roses there in what he had supposed" because "a lot of Friedman's recommendations" and hypotheses that had appeared in Friedman's research of the 1950s and 1960s would receive support in the body of 1970s work that was generated in the new methodological environment of rational expectations and optimization-based macroeconomic

[336] In the same remarks, Lucas also cited an attraction of his initial move in 1974 that "Robert Barro [who would leave in 1975, as already indicated] was doing some good work."
[337] For a detailed discussion, see Nelson (2020b, Chapter 15).

models. (Edward C. Prescott, interview, February 16, 2016.)

The items that Prescott specifically cited were—with respect to the Phillips curve—the result that "there's no permanent tradeoff, that it didn't make economic sense;" the permanent income hypothesis which, in emphasizing intertemporal decisions, was "so important… [in relaying] the economics that people were saving for a reason;" and the lesson that, in setting monetary and fiscal policy, "you need to stick to rules that have good operating characteristics." Friedman, Prescott observed, had built that "intuition [supporting these propositions], without all those developments in dynamic general equilibrium, and using probability, recursive methods." (Edward C. Prescott, interview, February 16, 2016.)

Michael Mussa was an example of the younger-generation monetary economists whose perspective was shaped heavily by Friedman's work. Mussa would later describe himself as "a wobbly monetarist" (*Chicago Tribune*, June 26, 1985). The "wobbly" qualification likely came about because of the growing doubts in the United States about relationships involving money that arose from the major velocity movements seen after 1981. In addition, as discussed below, Mussa was never a strong proponent of the constant-monetary-growth rule.

Mussa was, nonetheless, highly sympathetic to many aspects of monetarism. Philip Meguire, who became a graduate student at the business school during the late 1970s, would later characterize the effect of Mussa's classes in these terms: "I was educated in the 1970s to be warm to monetarism." (Philip Meguire, personal communication, May 2, 2012.) Mussa's continuing positive attitude, in subsequent years, toward monetarism was reflected in his analysis of U.S. monetary policy over the 1980s in Mussa (1994). In contrast to numerous other retrospectives on U.S. monetary policy in the 1980s, this analysis gave the behavior of monetary aggregates considerable weight in judging monetary policy stance.

Mussa was also interested in Friedman's monetary work outside monetarism proper. Mussa (1976a, p. 306) had noted that Friedman's 1969 article "develops the concept of the 'optimum quantity' and 'optimum rate of growth' of money."[338] This particular Friedman paper would receive attention in the research of numerous University of Chicago economists other than Mussa's, with Lucas and Stokey (1983) being perhaps the most notable example. As stressed in Nelson (2020a, Chapter 9), the 1969 Friedman paper was a breed apart from Friedman's main

[338] In fact, a legitimate criticism of the Friedman (1969a) paper was that it really concerned optimal monetary growth and had misapplied the "optimum quantity" to this growth-rate concept.

monetarist writings. Relatedly, both in 1969 and subsequently, Friedman seemed anxious to make clear that the deflation rule derived in that article was not something that he prescribed or to which he put attached much practical applicability. Indeed, one of the methods that Friedman eventually used to separate himself from the deflation-rule prescription was to cite a paper by Mussa—specifically, Mussa (1977)—as the source of the derivation of the rule.[339]

The natural rate hypothesis, too, was part of Friedman's body of work that Mussa pursued. Although Mussa's (1976a) book did not actually cite Friedman's 1968 paper on the Phillips curve, in other work during this period, Mussa (1976b, p. 225) had defined and used the "natural rate of output" concept. Furthermore, on numerous occasions, Mussa credited Friedman with the natural rate hypothesis and stressed its importance. For example, Mussa (1980, p. I–96) observed, "The basic idea of the natural rate hypothesis was initially advanced by Milton Friedman (1968[a]) and Edmund Phelps (1968)," while Flood and Mussa (1994, p. 63) noted: "An essential idea that was introduced in Friedman's thinking and in other macroeconomic theorizing at that time was the 'expectations-augmented Phillips curve.'"

In contrast to his work on the optimum quantity of money, Friedman was very happy to be closely associated with his development of the natural rate hypothesis. But because it focused on aggregate-supply relations, this, too, was seen as a contribution somewhat separable from his monetarist body of work. In effect, Friedman acknowledged this separation himself in his Nobel lecture when he stressed that, in his discussion of Phillips-curve dynamics, he would not be taking a stand on what forces drove nominal aggregate demand.[340] A further complication was that widespread acceptance of the natural rate hypothesis among economists by 1977 disguised a considerable amount of dissent from Friedman's particular account of the Phillips curve.

In particular, as will now be detailed, among the monetary economists based at the University of Chicago in the decade after Friedman's departure, Michael Mussa would be a prominent believer in a sticky-price basis for the short-run nonneutrality associated with the Phillips curve. He was not the only economist making this case in the 1970s, but he marked himself in doing so from the University of Chicago.[341]

---

[339] See Friedman (1987a, p. 18). This attribution may also have been, in part, an acknowledgment on Friedman's part that Mussa's derivation of the deflation rule was more rigorous than his own had been.
[340] Friedman (1977c, pp. 453–454).
[341] In addition to Mussa, there were a few other economists at the University of Chicago in the immediate years after Friedman's departure whose work stressed protracted and systematic (though ultimately temporary) effects of

There was considerable acclaim for and acceptance of the natural rate hypothesis by 1976, as Friedman's Nobel award confirmed. Nevertheless, the apparent consensus disguised underlying considerable deviations in views from those that Friedman had advanced concerning Phillips-curve relationships. Notably, the cost-push view of inflation was far from dead in policy circles. For example, about ten days before Friedman won the Nobel award, Phillip Lynch, speaking for the Australian government, in the address to the IMF discussed earlier in this chapter, stated that there was a "remarkable degree of consensus" that it was not an option to "buy less unemployment at the expense of higher inflation."[342] But Lynch's actual practice of anti-inflation policy, like that of policymakers in many other countries during the late 1970s, involved considerable reliance on attempts to hold down prices and wages by nonmonetary means. Policymakers in this era therefore tended to embrace a perspective closer to that of Arthur Okun, who saw inflation largely in cost-push terms despite accepting aspects of the accelerationist position, than that of Friedman.[343]

The view predominant among University of Chicago economists in 1975−1979 did seem superficially to be very close to Friedman's. A paper that Roger Kormendi presented to the money workshop on April 5, 1977, three months after Friedman's departure, began: "The cornerstone of modern macroeconomic theory is the so-called natural rate hypothesis."[344] Kormendi went on to cite Friedman, Phelps, and Lucas as having provided the basis for the hypothesis. Furthermore, there was little sympathy for cost-push notions of inflation, and on October 22, 1975, during Friedman's tenure heading the workshop, Lucas had sent a memorandum to workshop participants denouncing the cost-push perspective.[345]

Notwithstanding these elements of solidarity with Friedman's analysis of inflation, however, the specification of the Phillips curve and approach to macroeconomics propounded by Lucas and other key proponents of rational expectations—especially those associated with the University of

---

monetary policy on real variables and who tended to favor a sticky-price-focused rationalization of the Phillips-curve relationship. These individuals included Mishkin, Jacob Frenkel, and Robert Nobay.

[342] In International Monetary Fund (1976, pp. 178, 180).

[343] See Chapter 5 above.

[344] Kormendi (1977, p. 1).

[345] As for Michael Mussa, his disdain for cost-push explanations of the 1970s inflation was evident in his Congressional testimony of November 1, 1983. In his written submission for the hearing, he referred to "the failure of the administration and the Federal Reserve to respond to the acceleration of inflation in 1977 and 1978." (In Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives, 1984, p. 204.) Implicitly, this criticism was that the authorities should have responded by firming *aggregate demand settings* in these years (whereas, in the event, they mostly put off tightening—specifically, of monetary policy—until the second half of 1978). In both years, there *had* been an administration response to accelerating inflation, but it had taken the form of nonmonetary (and non-demand) measures against inflation. For details, see the next chapter.

Chicago—had parted company with Friedman by rejecting short-run nominal rigidity (in the form of stickiness of wages, prices, or both) as the source of short-run curvature of the Phillips curve and as a key reason for the nonneutrality of monetary policy with regard to the business cycle.

In contrast to Lucas, Prescott, and numerous other 1970s proponents of the application of rational expectations and microfoundations, Mussa was an advocate of the importance of long-lasting nominal stickiness. Like Friedman, he rejected the notion that rational expectations, in themselves, precluded the possibility of systematic effects of monetary policy on output: indeed, Mussa rejected the premise advanced by others that Friedman had grounded his own Phillips-curve analysis in adaptive expectations, contending instead: "In Friedman's original work, … expectations are forward-looking."[346] But Mussa granted that more work needed to be done in order to make the modeling of a sticky-price-based Phillips curve rigorous, and he proceeded to seek to make a contribution in that direction himself.

In a paper titled "Sticky Prices and Disequilibrium Adjustment in a Rational Model of the Inflationary Process" that Mussa presented to the money workshop on May 3, 1977, he provided his own attempt to reconcile the natural rate hypothesis, sticky prices, and rational expectations. The paper would ultimately be published in the *American Economic Review*, and, in it, Mussa (1981, p. 1070) would acknowledge that "serious theoretical difficulties are encountered in models that combine rational expectations with the notion that prices are sticky and respond slowly" to excess aggregate demand or supply but would go on to propose a means of generating this combination. In his model, Mussa (1981, p. 1074) observed, the price-adjustment equation "is similar to the 'expectations augmented Phillips curve' that has been widely employed in discussions of wage and price dynamics."

Mussa's model did not catch on and was far less influential than other attempts in the late 1970s and early 1980s to bring price stickiness into a rational expectations framework, notably those of Stanley Fischer, John Taylor, and Guillermo Calvo.[347] But, in contrast to many of his University of Chicago colleagues, Mussa had correctly anticipated that the economics profession's acceptance of the natural rate hypothesis and of rational expectations would ultimately not

---

[346] Flood and Mussa (1994, p. 63). In a similar vein, Laidler (1997, p. 89) observed that in "Friedman's (1968[a]) application... to the Phillips curve, explicitly adaptive expectations were conspicuous by their absence."
[347] See, however, Clarida and Galí (1994) and McCallum and Nelson (1999) for late examples of studies that used elements of the price-setting specification that Mussa advocated.

involve eschewing an assumption of short-run price stickiness. Indeed, Mussa had foreseen the direction in which the profession would go as early as April 1975, when he remarked: "I think you can have relatively rigid wages and prices even in an environment in which there is no substantial amount of money illusion."[348]

Mussa would increasingly specialize in international economics and, in that context, he would become a champion of bringing the natural rate long-run restriction into the Phillips curve of open-economy models. He called in a conference in October 1980 for open-economy models to incorporate the hypothesis, especially in view of "the absence of any factual basis" for a long-run tradeoff in recent years' data.[349] He also made clear that he believed that the appropriate specification of the Phillips curve in these open-economy models was one involving incomplete short-run price adjustment—a message that he underlined in a famed later paper (Mussa, 1986b) in which he indicated that the time-series behavior of real exchange rates in the floating era was consistent with gradual adjustment of the price level to disturbances.

One point of contrast with Friedman lay in policy evaluations. Mussa would come to be known for "his outspoken and occasionally acerbic style" (*Financial Times* (London), March 8, 2001). But neither at the time nor later was he as trenchantly critical of 1970s Federal Reserve policy as Friedman was. Certainly, Mussa shared the judgment that monetary policy was systematically flawed over this decade. In 1983, for example, he would suggest that "the perceived long-run stance of U.S. monetary policy" during the 1970s had been one of excessive looseness.[350] And looking back on monetary policy in Arthur Burns' second term (1974−1978) as Federal Reserve chair, Mussa (1994, pp. 87, 95) noted the "significant accomplishment" of getting inflation down in 1975−1976 but nevertheless registered the negative judgment that the period from January 1975 was one of "inadequacy of the Federal Reserve's efforts to curb inflation." He was nevertheless not as viscerally critical about Burns' performance (on the criteria of both average performance and variability) as Friedman had been on many occasions—such as in October 1975, when Friedman remarked: "The slow growth of the last couple of months is indicative of the Federal Reserve's stupidity." (*Dallas Times-Herald*, October 17, 1975.)[351]

[348] In Birnbaum and Laffer (1976, p. 157).
[349] Mussa (1980, pp. I–77 to I–78; quotation from p. I–77).
[350] From Mussa's testimony of November 1, 1983, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1984, p. 198).
[351] As indicated in the previous chapter, this temporary weakness was followed by a revival of monetary growth in 1976. In combination with the continuation of expansionary settings into 1977 (discussed below and in the next chapter), this was a posture of monetary policy that Friedman later largely blamed for the late-1970s surge in inflation. Mussa (1994, p. 89) argued with regard to developments in 1976 that "the evidence… does not indicate

More generally, Mussa did not share Friedman's skepticism about the practical scope for a central bank to pursue an output-gap-stabilizing, activist monetary policy in circumstances of a short-run nonvertical, and long-run vertical, Phillips-curve relationship. Mussa's greater confidence in the prospects for an activist policy in this situation actually stemmed in good part from a belief that he shared with Friedman—that price stickiness produced long-lasting effects of monetary actions on output. To Mussa, this gave policymakers increased leeway to arrive at policy actions that steered output closer to its potential value. In a paper prepared for a July 1977 conference, he viewed the key question with regard to the Phillips curve as "'how long is the long run?' If the long run is a year, then macroeconomic policy (with its lags and uncertainties) cannot be very useful. If the long run is a decade, then it may be useful to think in terms of a policy tradeoff between inflation and unemployment."[352] Mussa did not see as strong a propensity as that Friedman perceived for policymakers to behave in an unintentionally destabilizing manner. Also unlike Friedman, Mussa was willing to use, in his analysis of current economic policy, time series on the output gap that were derived, in part, from estimates of potential output.[353]

Evidently, therefore, despite his common ground with Friedman about the formulation of the Phillips curve and about the negative judgment about U.S. monetary policy as conducted over much of the 1970s, Mussa did not adhere to Friedman's comprehensive opposition to an activist central-bank reaction function.[354] This divergence in perspectives was reflected not only in Mussa's research writings but also in his willingness to spend long periods in policymaking.

---

that the Federal Reserve was knowingly fueling the resurgence of inflation." Friedman's commentary during 1976 was consistent with this evaluation, but it came in a barbed form: Burns, he told an audience of financial market participants at an event in Boston, "has good intentions, I'm sure, in trying to get the inflation rate down to 1 percent. But we can't judge what will happen on good intentions. After all, Mr. Burns did not intend for inflation to go up to 12 percent." (*Boston Globe*, June 2, 1976.)

[352] Mussa (1979, p. 196).

[353] See his testimony of November 1, 1983, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1984, p. 220). It should be stressed that, by this vantage point of late 1983, it was typically the case that estimates of U.S. potential output had recognized the post-1973 productivity slowdown and so lacked much of the sizable error present in 1970s-vintage estimates.

[354] Mussa's perspective that the monetarist critique of the official sector had gone too far had a counterpart in the deterioration over time in his relations with one of the key monetarists, Allan Meltzer. Mussa, consistent with his background as a UCLA undergraduate student in 1962−1966 and his 1971−1976 appointment at the University of Rochester, would be a key participant in many of the Carnegie-Rochester conferences held from 1973 to 1989, and Brunner and Meltzer (1993, p. 47) cited Mussa (1986b), a paper prepared for the Carnegie-Rochester conference series, as a major study in the literature documenting price stickiness. But in the 1990s, concurrently with Mussa's tenure at the Fund, Meltzer would be a vocal critic of the IMF, and Meltzer and Mussa had ceased to be on speaking terms by 2000. Mussa was taken to be referring primarily to Meltzer when he remarked: "Despite recent criticism of the institution, the Fund is undoubtedly a highly efficient international organization." (*Financial Times* (London), March 8, 2001.)

Of these periods, Mussa's membership of the Council of Economic Advisers from 1986 to 1988 was notable as being one in which the CEA became more outspoken about the nature of the short-run Phillips-curve relationship. Although, as stressed by Romer and Romer (2002, pp. 33−34), key U.S. economic-policy agencies—including the CEA—largely embraced the expectations-augmented Phillips curve (including a vertical long-run form) from about 1979 onward, the Reagan Administration had a sporadic record when it came to acknowledging in its public statements that there were real economic costs in the short run associated with bringing inflation down.

Notably, the 1985 *Economic Report of the President*, for example, had acknowledged that the 1981−1982 recession had resulted from the restriction of aggregate demand that brought about the disinflation of the 1980s, but it claimed that this recession had been an "unexpected… part of the economy's transition to lower inflation."[355] This passage of the report would receive sharp criticism from Dornbusch and Fischer (1987, p. 500): they deemed it "simply not accurate" and contrasted the report's claim with the fact that in the early 1980s "[m]ost economists shared Friedman's view... that disinflation would bring a recession."

As noted, Mussa's affiliation with the CEA began, initially in the role of a consultant, in October 1985—well after the 1985 *Economic Report* had been produced and released. By the time of the production and appearance of the 1987 report, Mussa was a full CEA member and had much to do with the content of the report.[356] The 1987 report embedded what Dornbusch and Fischer would call "Friedman's view"—that Phillips-curve dynamics made a recession an inevitable part of reducing inflation.

The 1987 *Economic Report* referred unequivocally to the "inevitable economic cost of disinflation."[357] Instead of portraying a recession as being avoidable or unexpected in conditions of disinflation, the report portrayed the disinflation-recession link as a basis for seeking, and then consolidating, price stability: "The destructive sequence of business cycles with progressively rising inflation rates and interest rates, punctuated by severe recessions, has been broken. With appropriate macroeconomic policies, the U.S. economy need not suffer, once again, the painful

---

[355] Council of Economic Advisers (1985, p. 29).
[356] Indeed, Mussa and CEA staff member Richard Clarida gave a briefing on the forthcoming report to U.S. Secretary of State George Shultz. (Remarks of Richard Clarida at the session of the Hoover Working Group on Economic Policy, Hoover Institution held on February 17, 2021.)
[357] Council of Economic Advisers (1987, p. 56)

process of wringing entrenched inflation out of the economic system."[358]

A talk with the U.S. president-elect

This assessment, published in early 1987, appeared just as the post-disinflation U.S. economic recovery was entering its fourth year. The events of the subsequent twelve months would underpin the assessment's validity, as 1987 would see a further period of reasonably low inflation, accompanied by the continuation of the U.S. economic expansion into a fifth year. This outcome contrasted with the most recent prior multi-year expansion, which had begun under President Ford in 1975 and then continued into the Carter years. That expansion had, at 58 months, failed to reach the five-year mark, and the 1987 *Economic Report of the President* would recall it as having "ended in a double crescendo of rising inflation and interest rates and falling economic activity."[359]

As detailed in the next chapter, Friedman had made a public warning in late 1976 of the dangers of pushing too hard on aggregate-demand policy to encourage the post-1975 economic expansion. This Friedman appeal was explicitly cast in terms of advice to President-elect Carter—who was being reported as receiving the opposite advice from his economic team

Friedman's warnings would prove prescient. The details of monetary policy decisions were beyond the president's control, but the tone set by the Carter Administration in its first year in office was certainly in the opposite direction of generating a consensus in favor of demand restraint. The holding off until 1978 and 1979 of monetary restriction that could have been applied in 1977 likely played an important part in producing the unfavorable configuration of economic data that President Carter would face by the start of 1980. The Reagan Administration in which Mussa would serve would likely not have come into being in the first place had a recession taken place earlier, in 1977 or 1978—bringing with it a correspondingly earlier, and lower, peak in inflation. Mussa certainly believed so, as was indicated in his remark: "One of the important consequences of the high inflation rate in '79 and '80 was Ronald Reagan."[360]

In late 1976, Carter was not altogether oblivious to the overheating danger. His awareness of it

[360] From Mussa's testimony of June 6, 1985, in Treasury and Civil Service Committee, House of Commons (1985 p. 51).

was evident when, near the end of the year, the president-elect contacted Friedman.[361]

With the Nobel events having lasted until mid-December, the Friedmans were left with only the final two weeks of 1976 to finalize preparations for their beginning-of-year relocation. In the course of this hectic process, and with the Friedmans having gone to their Vermont home for the holiday season (Instructional Dynamics Economics Cassette Tape 205, December 1976, Part 2), Friedman received, on Christmas Day 1976, a surprise call from the president-elect.

Jimmy Carter asked to be put through to Milton Friedman and, assured that he had been, began: "I've wanted to talk to you, but first let me congratulate you on the [Nobel] prize." Unfortunately, Carter's staff had connected him not to Milton Friedman but to one of Friedman's numerous namesakes, in particular—Mr. Milton (Milt) Friedman, a member of President Ford's staff (*Detroit Free Press*, December 26, 1976).[362] Carter was, in due course, connected to *the* Milton Friedman—who, writing in his memoirs more than two decades later, described his conversation with Carter as having been a "pleasant talk" but relayed no details on its contents.[363]

Years earlier, and only about ten days after the conversation occurred, Friedman had provided a bit more of a glimpse into the exchange. "We talked casually for a few minutes... We had a nice pleasant conversation… Carter asked for some comment on the economy." (*San Francisco Examiner*, January 5, 1977.).

It would prove to be their only conversation—and Friedman did not find a convert. Once Carter took office in 1977, Friedman would before long find himself greatly at odds with the approach of the new president.

---

[361] Carter had, however, missed an opportunity to mention Friedman in his third televised debate with President Ford, held on October 22, 1976. Carter had received criticism for having been willing to be interviewed by *Playboy* magazine. Responding in the debate to this criticism, the Democratic presidential candidate listed several celebrities who had been interviewed by *Playboy* in the past. His catalogue included William Buckley but omitted Friedman, notwithstanding Friedman's having won his Nobel award just eight days earlier and the fact that *Playboy*'s February 1973 issue had included a long interview with Friedman.
[362] Ford's staff member Milton Friedman had served as senior speechwriter and special assistant to the president (*The Detroit News*, February 5, 1976).
[363] Friedman and Friedman (1998, p. 459).

APPENDIX: FRIEDMAN'S WORKSHOP ON MONEY AND BANKING IN THE 1960S AND 1970S

Nelson (2020a, Chapter 10) discussed the launch of, and early years of, Friedman's Workshop on Money and Banking in the 1950s. This appendix provides the recollections of several participants in the workshop in the mid-1960s through 1976, the final calendar year in which Friedman ran the workshop. An area excluded from the following discussion is the workshop's dialogue on rational expectations: this was considered in Nelson (2020b, Chapter 15). Meiselman (1975, p. 295) characterized the workshop members in the 1950s as "a small and abrasive counterrevolutionary cell," having a perspective contrary to the Keynesian mainstream of the economics profession.[364] Meiselman, who was writing from the vantage point of 1972, added: "The ground has shifted so much on these issues that my students now find it difficult to believe that many of the debates of yesteryear really did take place." By the mid-1960s, this shifting of ground was well underway. In addition, by this point the money workshop had acquired a considerable reputation outside the university as a formidable forum for the discussion of monetary issues. The opportunity to present at the workshop was consequently one that many researchers who were located outside the university accepted with alacrity.

It was very typically the case, however, that the experience of actually giving a paper in the workshop was a considerable ordeal. Michael Darby recalled: "Occasionally, the visitors would get their feathers ruffled: they weren't used to it, and maybe they didn't believe the warnings." (Michael Darby, interview, October 15, 2013.)

Many of those who presented in the workshop did indeed look back on it as a grueling experience. Michael Parkin presented "Inflation and Unemployment in an Indexed Economy: Some Analytical Issues" in the workshop session of November 18, 1975. He recalled this event as arising because "there was an attempt by some people in Chicago, to recruit me." But when "I gave a talk in Chicago in Milton's workshop, I got absolutely brutalized." (Michael Parkin, interview, May 29, 2013.) Parkin recalled the workshop's format, which consisted of two hours of forensic examination of the paper under discussion, as putting the presenter through the

[364] Cagan (1976b, p. 155; p. 86 of 1978 reprint) provided a similar characterization of the reactions that researchers on money faced in the early to mid-1950s. Cagan's account, which emphasized the condescension that he faced in his early career when he indicated that his research used the quantity theory, has become a favorite article for authors to quote when conveying the flavor of economic opinion in the 1950s: see McCallum (1986a, p. 9; 2016, p. 56) and Meltzer (2009a, p. 17). An indication of the way in which professional opinion was changing by the mid-1960s was provided by Cagan's joining the economics department of Columbia University in 1966.

wringer.[365]

Stanley Fischer was a colleague of Friedman's in the economics department from 1969 to 1973.[366] Fischer recalled: "He also said in the first one [I attended], 'Now, we want you to bring your papers here so that we can discuss them and help you... So we don't want to see completed papers.'… And he said, 'You know, just bring your papers when they're imperfect.'" Fischer observed that he and J. Phillip Cooper of the business school heeded this guidance by scheduling a workshop presentation of a draft version of a joint paper.

The two presented "Simulation of Monetary Rules in the FRB-MIT-Penn Model" (later published as Cooper and Fischer, 1972) at the workshop on April 7, 1970. "So we wrote half the paper, and we arrived there. And after bleeding to death for about an hour, I swore that there was never going to be another incomplete paper from me in the money workshop, because there was no mercy shown to anybody there. I'm not sure whether it's a good way of doing it or a bad way of doing it. But as I say, economics at Chicago was tough: people were friendly, but once you got down to intellectual stuff, the atmosphere was very, very demanding." (Stanley Fischer, interview, August 30, 2013.)

Charles Upton, then of the University of Chicago's business school, co-presented a paper in Friedman's workshop in February 1975 (see Gould, Miller, C.R. Nelson, and Upton, 1978, p. 229). Upton recalled: "Milton always invited the speakers to have lunch before the talk. And those lunches tended to have sort of the atmosphere of the last meal. Because you knew the criticism [in the workshop] was going to be rigorous. It was not designed to prove that you're stupid, but, you know, Milton would open the workshop by saying, 'Any comments on page one?' You almost never got beyond page three, O.K.? It was brutal." (Charles Upton, interview, January 8, 2015.)

In Nelson (2020a, 2020b), it was repeatedly stressed that, in important respects, the University of

---

[365] Two hours was the allotted length of time for the workshop, but Bennett McCallum—who attended the workshop "religiously" during the quarter in which he visited the economics department in 1975, and who presented what became McCallum (1976) at a workshop session on February 25, 1975—noted that "we might go two-and-a-half hours sometimes." (Bennett McCallum, interview, June 13, 2013.)

[366] Fischer joined the economics department, after graduation from MIT, in 1969, initially under a postdoctoral fellowship that included teaching responsibilities, before serving from 1970 to 1973 as an assistant professor in the department (American Economic Association, 1981, p. 145; Stanley Fischer, interview, August 30, 2013). See the next chapter for further discussion.

Chicago's economics department was not a Friedman-dominated body: many department members had interests different from Friedman's, and even in Friedman's field of money there were other power centers in the department. With regard, however, to Friedman's own turf of his money-and-banking workshop, his dominance of proceedings is not in question. Indeed, it was corroborated by the recollections of many workshop participants interviewed for this book. Fred Levin, a graduate student at the department in the early 1970s, observed that "if a professor was there, he wasn't treated any better than any of the students. It wasn't a joint workshop, with Friedman running it with other professors. No, it was Friedman's workshop." (Fred Levin, interview, March 10, 2014.)[367]

The page-by-page analysis of the paper was a distinctive Friedman's arrangement. "I actually think it was not the best way to run a workshop," observed Frederic Mishkin, who, as noted earlier in this chapter, presented at the workshop in late 1976. "I think that's one of the reasons it did change [after Friedman left]. You frequently got too bogged down in details before you got to the essence, and, frequently, you really didn't get to the key part of the paper." (Frederic Mishkin, interview, June 18, 2013.)

Robert Lucas (interview, March 12, 2013) noted of this aspect of the workshop format that, "as soon as Friedman left, we dropped it. I'd got into the habit of listening to presentations to decide whether or not I wanted to read the paper. So I did not like preparing in advance that way, and I had never done it."

But when Friedman was still at the university but happened to be away for spells, those running the workshop maintained his format. For example, during his visit to the university in the 1964/1965 academic year, Allan Meltzer ran the workshop in Friedman's absence and adhered to the Friedman format (see Chapter 16 below). Among the others who oversaw workshop sessions during periods when Friedman was away were David Meiselman (Robert Lucas, interview, March 12, 2013), Harry Johnson in the 1962/1963 academic year (William Poole, interview, April 30, 2013; see also H.R. Heller, 1989, p. 65), Lester Telser in 1967 (Thomas Simpson, interview, May 29, 2013; Arthur Laffer, interview, June 10, 2013), and Richard Zecher in the early 1970s (Richard Zecher, interview, September 3, 2013).

[367] One means by which the academics were put on the same plane as other participants was the rule, not always enforced, that every participant had to present a paper to the workshop at some point. "Friedman's idea was: If you're going to hand out all this hard criticism, you've got to stand up and take some punches yourself," Robert Lucas observed (interview, March 12, 2013).

In the Friedman era, it was usually the case that several other teachers affiliated with the economics department or with the business school attended the workshop. One of the most regular attendees was the business school's Arnold Zellner (Bennett McCallum, interview, June 13, 2013). Others who were very often present at the workshop during their years at the university were Martin Bailey (David Meiselman, interview, July 16, 2014), Arthur Laffer (Arthur Laffer, interview, June 10, 2013), and Robert Barro (see Barro, 2007, p. 133). Aaron Director also attended the workshop in its early years (Richard Timberlake, interview, September 10, 2014).

Harry Johnson was a participant in the money workshop in the 1960s and 1970s but was more closely associated with the university's trade workshop (*a.k.a.* the International Economics Workshop: see Harrod, 1970, p. 617, and McCulloch, 2010, p. 534). The trade workshop was regarded as quite different from the money workshop.[368] Robert Aliber observed that "there was a difference in the tone of the two workshops. The trade workshop was a little more collegial." (Robert Aliber, interview, May 1, 2013.) And Arthur Laffer observed of the money workshop: "The students in that workshop were far from objective. They were there to curry favor with Friedman, and if they felt that Friedman didn't like something, they ganged up on the person [presenting]." (Arthur Laffer, interview, August 11, 2014.)[369]

Other attendees of the money workshop, while concurring that it had a freewheeling atmosphere, viewed the give-and-take that took place in a more positive light. Richard Zecher observed: "And that's the reason it was called a workshop, I think, because it was not someone lecturing somebody else. It was very much interactive." (Richard Zecher, interview, September 3, 2013.) Michael Darby described the rationale for the workshop in these terms: "The idea was that it was a workshop; it wasn't a polite seminar where you went to present your work and have your ego massaged. That was viewed as the strength of Chicago—that people really cared about ideas, and if you *were* giving a paper there, you really would come out with something you could use to improve it—rather than, you know, have your ego stroked." (Michael Darby, interview, October 15, 2013.) William Dougan, a graduate student in economics at the university during the mid-1970s, stated that Friedman's "workshop was a true workshop. The idea was: We're here to help you write a better paper. And so the focus is on the paper; this is not about you educating us, although, with any luck, that happens [as well]." (William Dougan, interview, September 19,

[368] Nevertheless, the two workshops occasionally held joint sessions, including when Don Patinkin presented "Indexation in Israel" on October 13, 1975.
[369] See also the remarks by Laffer and Marc Miles quoted in Chapter 11 below.

2013.) Robert Nobay, who was a colleague of Friedman's during the latter's closing years at the university in the mid-1970s, said of the workshop, "it was fundamentally an important adjunct to supervision. So, we had a bunch of very active Ph.D. students who would take anyone to task." (Robert Nobay, interview, December 3, 2013.)

William Gibson, a workshop attendee in the mid-1960s, stated that "it was a highly charged and competitive atmosphere, but for good reason, and a lot of good stuff came out of it." (William Gibson, March 7, 2013.) Gerald Dwyer remarked: "The money-and-banking workshop was really focused on people's papers… The interesting thing was, it seemed like we saw a fair number of papers that were coming out in the *JPE*—after they were accepted, apparently. And they'd get torn apart." (Gerald Dwyer, interview, August 20, 2013.)

With respect to Friedman's interaction with students at the workshop, William Poole, who attended the workshop as a graduate student in the early 1960s, observed: "Milton was very gentle with students, and encouraging, unless he thought the student was just really way, way off base. I mean, he didn't pull any punches. He was polite, but he didn't hold back criticism. But he would work hard to get the student to understand why there was a mistake in the paper, and get the student to defend what he had done. And most of the time, obviously, Milton was correct, and the student was wrong." (William Poole, interview, April 30, 2013.) Ann-Marie Meulendyke, a graduate student in the late 1960s, recalled: "He would never put a student down, but he would put other professors down for what he saw as sloppy or careless thinking." (Ann-Marie Meulendyke, interview, April 29, 2013.)

As already stressed, one of Friedman's edicts was that workshop attendees had to have read the paper in advance. Bennett McCallum recalled that "you were just strictly supposed to have read the paper before you came, and you'd better not demonstrate that you had not read the paper. He looked very unfavorably on people who did that." (Bennett McCallum, interview, June 13, 2013.) Friedman practiced what he preached, himself reading the presented papers in advance. In this connection, Robert Nobay recalled that one presenter in the mid-1970s "produced the most turgid paper, which was absolutely full of matrix algebra and the like. And I gave up on page three or four. And it was pretty obvious that I wasn't alone… Bob Lucas said to me, 'I gave up on page 10.'" Nobay observed that "the only person who kept that [particular] seminar going" was Friedman. Nobay remembered Friedman making remarks to the presenter along the lines of, "'And on page 34, you've missed out this term, and you've got the square in the wrong

place,' et cetera… He was the only one I'm aware of who actually went right through the paper. So, you know, that was his professionalism." (Robert Nobay, interview, December 3, 2013.)

Friedman made no attempt at being a neutral chair of the workshop, instead voicing strong opinions on the paper being presented. For example, Mehrling (2005, p. 159) related an occasion when Friedman introduced a presentation by Fischer Black by observing: "We all know that the paper is wrong. We have two hours to work out why it is wrong." As it happens, the occasion for this statement cannot have occurred at the date of "sometime in spring 1972" that Mehrling (2005, p. 315) provided. It is also very likely that Black did not present the paper that Mehrling gave as what was under discussion at the workshop, but, instead, presented a different paper.[370] The statement itself nevertheless rings true as a Friedman remark. It likely occurred at Fischer Black's presentation at the money workshop held on November 21, 1972, of the paper "The Uniqueness of Price Level in Monetary Growth Models" (later published as Black, 1974).

A preamble of the kind that Friedman gave for Black's workshop presentation might well be regarded as constituting prejudicial comment. At the same time, however, it was hardly to be expected that Friedman was going to take a neutral stand on the anti-monetarist arguments that Black advanced in his work. Furthermore, the Friedman remark quoted by Mehrling is similar to the kind that leading Keynesians of Friedman's generation gave at seminars. In this vein, while Robert Hall noted that "Milton was famous for derailing the discussion," he added that "Samuelson had much the same effect at MIT." (Robert Hall, interview, May 31, 2013.) Another case in point is brought out by the following recollection that Christina Romer gave of a presentation of Romer (1986): "The first time I presented this research at MIT in 1984, Franco

---

[370] As discussed in Nelson (2020b, Chapter 15) and Chapter 2 above, Friedman was in the Pacific and Middle East until the late spring of 1972, after which he was based in his second home in Vermont through the end of September. (See Rose Friedman's remarks in Friedman and Friedman, 1998, pp. 417–418—a chronology confirmed by the contemporaneous Instructional Dynamics Economics Cassette commentaries.) Prior to late September 1972, Friedman was in Chicago in the year only briefly, for his son's wedding earlier in September (Friedman and Friedman, 1998, p. 417; Gloria Valentine, personal communication, March 14, 2015).

Mehrling stated that the paper that Black presented was Black (1972). Friedman indeed knew of this paper: see Friedman (1977b, p. 413) and Friedman and Schwartz (1982, p. 604). But there was no confirmation in the acknowledgments or text of Black (1972) that that paper was presented at the money workshop. Indeed, there was no indication in Black (1972) that Friedman provided comments on an earlier draft and, as Friedman's work was discussed heavily in the study, it would seem likely that Black's revised paper would have made mention of feedback from Friedman, had Black received any. As indicated presently, the workshop incident related by Mehrling very likely pertained to a presentation of a *different* Black paper (confirmed in University of Chicago Library records as having been presented at the workshop), namely, what became Black (1974). This possibility is buttressed by the fact that Friedman himself noted that Black had presented results like that in Black (1972) "in a number of papers" (Friedman, 1977b, p. 413).

Modigliani stood up and said, ‘I don’t believe you, because if I did, I’d be very upset.’”
(*Business Week*, July 18, 1993, p. 85.)

Milton Friedman and Economic Debate in the United States, 1973–2006
Chapter 8: Debates on Monetary Policy and Macroeconomic Stabilization, 1977 to 1978

Edward Nelson[1]
Federal Reserve Board
July 30, 2023

I. EVENTS AND ACTIVITIES IN DEBATES ON MONETARY POLICY AND MACROECONOMIC STABILIZATION, 1977–1978

A preamble to a March 1977 newspaper interview with Milton Friedman described him as "now on leave" from the University of Chicago (*U.S. News and World Report*, March 7, 1977). And in the March/April 1977 issue of *Society*—a public-affairs periodical published by Friedman's undergraduate alma mater, Rutgers University—he described himself as a citizen and taxpayer of Chicago.[2]

These characterizations were accurate, but they did not tell the whole story. When completing his tax returns around the time the *Society* article appeared, Friedman would certainly have fallen into the category of a citizen of Chicago, with his local and state tax liabilities reflecting his residence in that city during calendar 1976. And, in early 1977, he was, indeed, on leave from the Department of Economics of the University of Chicago. But it was also true that he was not coming back to the department. In fact, as of March 1977 Friedman had already left both the University of Chicago and the city of Chicago for good.

Milton and Rose Friedman relocated permanently to San Francisco at the very start of 1977—in so doing, missing one of the city of Chicago's worst winter months in recent history. They arrived in their new home city on Monday, January 4, and the following day Friedman started his

The views expressed here are the author's alone and should not be interpreted as those of the Federal Reserve or the Board of Governors. he author is grateful to the interview subjects for their generosity in providing useful information, as well as for comments provided by participants in a seminar (November 2013) at the University of California, Berkeley, at which some of the material in this chapter was presented, as well as to Charles Steindel for comments on an earlier draft of this chapter. See the Introduction in Nelson (2020a) for a full list of acknowledgments. The author regrets to note that, in the period since the research for this chapter was begun, eight individuals—Kenneth Arrow, David Backus, Gary Becker, Charles Brunie, David Lindsey, Allan Meltzer, Richard Muth, and Paul Volcker—whose interviews with the author are drawn upon below, have passed away.

[2] Friedman (1977g, p. 89). In addition, in *Newsweek* (March 21, 1977), Friedman described Senator Adlai Stevenson (D–IL) as one of his state's senators.

three-month spell as a visiting scholar at the Federal Reserve Bank of San Francisco (*San Francisco Examiner*, January 5, 1977).[3]

Visiting the Federal Reserve Bank of San Francisco

Friedman's spell as a visiting scholar at the Federal Reserve Bank of San Francisco bridged much of the gap between his thirty years at the University of Chicago and what, to his surprise, would prove to be an almost-30-year stretch at the Hoover Institution, starting in fall 1977. In a public statement around the time of Friedman's visitor appointment, the San Francisco bank's president, John J. Balles, observed: "Milton Friedman has altered the course of economic thinking and continues to contribute [to] and influence our fundamental judgments concerning the theory and practical applications of economics." (*American Banker*, January 18, 1977.)

Friedman's visit had arisen from an invitation that Michael Keran extended after Keran became research director of San Francisco's reserve bank in 1973. When seeing Friedman in the city of Chicago in the mid-1970s, Keran recalled, "I said, 'We have a visiting-scholar program at the San Francisco Fed. Would you be interested in participating?' And, to my surprise, he said, 'Yes.'" (Michael Keran, interview, March 7, 2013.)

Keran had, from a distance, been a student of Friedman's during the 1960s, having been guided into his dissertation research topic (the study of money and the business cycle in Japan) by Friedman when they met in Japan in 1963, and having then completed his doctoral dissertation at the University of Minnesota, with long-distance feedback from Friedman.[4] Prior to being hired as the Federal Reserve Bank of San Francisco's research director, Keran had been at the St. Louis bank's research department during the period in which the latter institution's monetarist research took off. Keran was hired to raise the San Francisco's research department's profile;

---

[3] The press coverage in connection with the formal announcement of Friedman's retirement from the University of Chicago indicated that his visiting position at the Federal Reserve Bank of San Francisco would last about six months (*Tampa Tribune* (Florida), November 3, 1976). However, in Instructional Dynamics Economics Cassette Tape 204 (December 1976, Part 1), Friedman indicated that his stay would only be (in University of Chicago terminology) over the winter quarter. Consistent with this, in correspondence with Alan Walters (February 9, 1977), Friedman indicated that his period as visiting scholar would finish on March 31 (a dating consonant also with Friedman and Friedman, 1998, p. 559). His activities in the second quarter of 1977—during which the Friedmans were based in their Vermont residence—are discussed mainly in the next chapter.

[4] See Friedman and Friedman (1998, pp. 325–326). The dissertation, completed at the University of Minnesota in 1966, was in effect confirmed as work in the money-workshop tradition via its inclusion, in revised form (see Keran, 1970), in a University of Chicago Press book collection, alongside several Friedman-supervised University of Chicago Ph.D. dissertations (see Meiselman, 1970).

but he also had in mind making its research sensibility more monetarist. "When I left St. Louis, I said, "I'm hoping to go to convert St. Francis to the views of St. Louis.'" (Michael Keran, interview, March 7, 2013.) Already by 1975, Friedman had applauded the stamp that Keran had put on San Francisco's reserve bank by increasing the monetary-research content of its monthly review (Instructional Dynamics Economics Cassette Tape 175, September 1975, Part 1). Having Friedman work temporarily among the bank's economists dramatically underlined the bank's shift of interest toward monetarism.

According to Keran, the rapport Friedman developed with the Federal Reserve Bank of San Francisco's research-department staff was "incredibly good. I'd take him around when he first came, to introduce him to the staff and the research assistants. And [over time] he extracted more information about them, especially the research assistants, than *I* knew. He was very good at making people feel at ease, asking them a lot of questions about themselves, and generally making himself very agreeable. That was a skill I envied." (Michael Keran, interview, March 7, 2013.)

Keran also recalled Friedman being "inundated" with mail during his stay, in the wake of the publicity of the Nobel prize and ceremony just before Friedman's move to San Francisco. Though he had not yet formally moved to Stanford University's Hoover Institution, that was already Friedman's official postal address for business correspondence. His secretary Gloria Valentine, who had started employment at the institution, would bring Friedman's voluminous mail to downtown San Francisco for his inspection.

Research activities

The research project that primarily occupied Friedman during his time as a visiting scholar was an investigation of the properties of the monetary base. Although he had a longstanding preference for an M2-type definition of money, Friedman saw attractions in the monetary base as an alternative monetary concept. Most obviously, monetary targeting that was focused on the base could sidestep the monetary-control issues raised by targeting an aggregate that included bank deposits.

A further possible reason for preferring the base was empirical. In their *Monetary Statistics*, Friedman and Schwartz had noted from their impressions of other countries' experiences that some of the most severe recorded velocity problems had arisen from the behavior of bank

deposits in the wake of financial innovation (including the extension of interest payments on deposits, as well as the creation of deposit substitutes) and changes in banking and monetary regulations. They suggested the stock of currency as an aggregate that could be used for monetary analysis in such circumstances, as currency series tended to be insulated from those institutional changes that bore specifically on the behavior of deposits.[5] In follow-up work during the early years of the 1970s, Friedman's graduate student James Lothian had offered the monetary base as another aggregate that could be more robust to financial innovation than was the case for monetary totals that consisted of the sum of currency and commercial bank deposits (Lothian, 1973, 1976).[6]

Militating against these arguments was experience that suggested that M1- or M2-type aggregates might be more reliable than currency or the base in terms of their relationship to aggregate economic activity. This experience included the Great Contraction of 1929−1933. The rise in both the currency/deposit ratio and the reserve/deposit ratio (for the M1 and M2 definitions of money alike) during the banking panics of those years had made currency and the base misleading indicators for a time. Furthermore, as the 1976 Bach Report had noted, the payment of interest on reserves, if enacted in the future, would amplify the difference between currency and bank reserves and render it more difficult to predict nominal income on the basis of the behavior of their sum. More routinely, reserve-requirement changes could make the base a misleading indicator of monetary conditions if the base series was not adjusted for those changes.

It was this last consideration that Friedman investigated during his early 1977 researches. As he and Anna Schwartz later recalled (*Wall Street Journal*, December 20, 1993), their *Monetary History* "attributed the depth of the 1929−33 depression and the occurrence of the later 1937−38 recession to Fed mismanagement." The 1937−1938 recession, being preceded by the Federal Reserve Board's 1936−1937 moves to raise reserve requirements, had highlighted for them the importance in practice of reserve-requirement changes as a factor bearing on the quantity of money.

For the postwar period, the same consideration applied in a different way. The Federal Reserve had, as Friedman observed, followed an interest-rate stabilization policy that meant that reserve-

---

[6] Friedman had referred to Lothian's work-in-progress in his consultant's memorandum to the Federal Reserve Board of June 9, 1971 (Friedman, 1971c, p. 10).

requirement changes were generally not allowed to have a powerful, 1930s-style, effect on the money stock. Rather, the Federal Reserve routinely offset its reserve-requirement changes with open market purchases or sales.[7] The fact that it did so, however, only underlined the differences between the base and the adjusted base (that is, the monetary base adjusted for changes for reserve requirements). The Federal Reserve Bank of St. Louis had, since the 1960s, provided a series on the adjusted base. In his 1977 investigations, Friedman compared the predictive performance, for variations in nominal income, of changes in the unadjusted monetary base with those of changes in the adjusted base.[8] He found that the adjusted monetary base performed far better. Friedman took this finding as suggesting that, in the case of the United States, one could not bypass the money-measurement problem simply by relying on high-powered money. Leaving aside the option, aired by Friedman and Schwartz, of treating currency as the monetary aggregate of interest, this finding implied that either the adjusted base or a currency-plus-deposits aggregate was needed as the measure of money.

Completion of this research project became a casualty of Friedman's busy schedule and waning research ambitions. A research article never came out of the project. Despite the enthusiasm of a coauthor at the Federal Reserve Bank of San Francisco, who worked on a draft of a paper that would lay out the project's findings, the writing-up of the project was never finished. The only major glimpse of the project that Friedman subsequently provided was his recollection of the project's results, which he gave in passing in the course of a floor discussion during an NBER Festschrift for Anna Schwartz, held in New York City in October 1987 (see Bordo, 1989, pp. 76–77).

Friedman had declared at the end of 1976: "My primary interest continues to be my scientific work."[9] This statement was not borne out by his subsequent activities. The year 1977 did see a number of research publications by Friedman, including multiple issuances of his Nobel lecture (discussed in the next chapter) and a written record of his January 1977 debate with Franco

---

[7] It was the fact that open market operations could offset reserve-requirement changes, while also being more easily varied than those requirements, that underlay Friedman's preference for the latter tool for the purpose of monetary control. For example, in 1973 he observed: "it's worth emphasizing that there is absolutely nothing that can be done by changes in reserve requirements that cannot be done by open market operations. Open market operations are a more sensitive and effective tool. Changes in reserve requirements are a blunt instrument which are discontinuous in time and, on the whole, are a poor instrument for monetary management." (Instructional Dynamics Economics Cassette Tape 124, July 4, 1973.) See Nelson (2020a, Chapters 2, 8, and 10) for further discussion.

[8] In Instructional Dynamics Economics Cassette Tape 206 (January 1977), the first cassette commentary recorded from San Francisco, Friedman referred to this exercise as a current research project.

[9] Friedman (1977m, p. 241; p. 265 of 1992 reprint).

Modigliani, published as a special issue of the *Federal Reserve Bank of San Francisco Review* (see Section III below). But, after 1977, it became clear that he had put his days of prolific research output behind him. The year 1978 became the first since 1956 in which no article by Friedman appeared in an economic-research journal.[10]

Gary Becker firmly associated the change in Friedman's research output to his relocation. "Well, he didn't do much research after he left Chicago. If he had stayed at Chicago, he would have continued to do research. I mean, you can't stay at Chicago without doing research; otherwise, you'd better leave. The reasons he left were for Rose, and so on, who didn't like Chicago and wanted to live in San Francisco. And yes, he basically stopped serious research at that point; he may have finished up some stuff, [but] he basically stopped doing serious research." (Gary Becker, interview, December 13, 2013.)[11]

By moving physically west to California, Friedman had left the metaphorical Wild West that was the University of Chicago economics world. At the Hoover Institution, he did on rare occasions hijack a seminar that he was attending (see the next chapter for an example). But Friedman's routine of hosting and attending freewheeling research workshops that could be disruptive for presenters, and a gladiatorial experience for attendees, was now behind him. So too were occasions such as that in 1962 when, as an audience member, he had turned a lecture at the University of Chicago by Harold Wilson into an unscheduled debate between himself and the future U.K. prime minister. *Fortune* magazine (March 19, 1984, p. 21) would note, "Friedman says he still misses the intellectual climate—but not the weather—at the University of Chicago."

Thomas Sargent contrasted Friedman's new permanent location of the Hoover Institution (which is discussed in more detail below) with competitive economics departments like the University of Chicago's. "Hoover is much more decentralized and, you know, relaxed. And it's not an intense research place. Some people like that and thrive on it, and some don't." (Thomas Sargent, interview, January 24, 2014.)

In some respects, Friedman did indeed thrive in this environment. As subsequent chapters will detail, his Hoover Institution years, particularly through about 1992, saw Friedman engage in prodigious writing and continuing activity in public policy. On these dimensions, Friedman

---

[10] Friedman (1978a) appeared in *Policy Review*, a public-policy periodical concerned with domestic-policy and national-security issues and published by the Heritage Foundation.

[11] For other reasons for Friedman's move away from research, see the discussion in Chapters 8 to 12 below.

remained a vibrant force past age 65, which he reached on July 31, 1977. But he did not have the engagement in research that would later characterize leading economists like Becker or James Heckman, who would, unlike Friedman, stay at the University of Chicago when they themselves reached their mid-sixties.

Influence in universities

Although Friedman was drifting away from participation in research, and was becoming a much less common sight at economic-research conferences, his impact on the profession was far from over. To be sure, his influence was not felt primarily through self-identified monetarist economists. There never really was a broad-based Friedman school in academia, located across major universities and represented by senior figures at those universities, of the kind there was for Keynesian economics. Instead, during his University of Chicago years, Friedman's following had a ragtag nature to it, with many of the senior economists sympathetic to monetarism not to be found at major universities but at smaller ones, as well as at Federal Reserve Banks and private-sector financial institutions.

And in 1977, although Friedman had just finished over two decades of overseeing graduate students working in the monetary field, it was rare to find such students of Friedman in prominent places at the "top twenty" U.S. universities. Certainly, there were a few cases. Notably, Phillip Cagan was an economics professor at Columbia University. But Cagan did not make an impact with his research of the 1970s and 1980s comparable with that he had generated with his research of the 1950s and 1960s. And Cagan tended, in any event, to take a much more softly-softly approach to argumentation than Friedman did. "He likes to be provocative," Cagan observed to the present author with regard to Friedman (Phillip Cagan, interview, January 13, 1992), making clear—by the way in which he said this—that that was not Cagan's own approach. Two Friedman students who had graduated in the early 1970s, Michael Darby and Benjamin Klein, were by late in the decade both situated at the University of California, Los Angeles—"one of the best regarded state universities in the country," the Friedmans would have occasion to note—and would become senior figures at the university, as well as among the most-cited researchers among his former doctoral students.[12] Darby, already well established in microeconomics, would remain prominent in monetary economics through the late 1980s, but Klein was moving away permanently from the monetary field by 1978.

[12] The quotation is from Friedman and Friedman (1980, p. 176).

In the late 1970s and the early 1980s, Friedman's monetary work made itself known to the next generation of economists. But it did not do so primarily via the promulgation of that research by his former doctoral students. Instead, others whom he had not taught or supervised would fulfill this function, through an activity from which he had now withdrawn: the teaching of graduate students in economics at U.S. universities. The positions Friedman took did end up becoming the subject of discussion for the next generation of economists, as his views on monetary matters would have a prominent place in graduate courses around the country. Furthermore, much of his work was presented favorably.

A particularly celebrated example of Friedman's success in influencing the thinking of the next generation took shape in the mid- to late 1970s at the Massachusetts Institute of Technology.[13] Friedman's longtime sparring partners at that institution—Modigliani, Paul Samuelson, and Robert Solow—remained vibrant presences. Indeed, by 1977, all three of them were maintaining a higher level of activity in the research sphere than Friedman. But, in large part, they had handed over teaching responsibilities for the core MIT graduate economics programs to a younger cohort in their department. In particular, Stanley Fischer, Friedman's 1969−1973 University of Chicago colleague, taught MIT's graduate monetary-economics course.

In 1969, Friedman had impertinently offered a generalization: What was received wisdom about monetary policy at the University of Chicago during one year became received wisdom at Cambridge, USA—but with a lag of five years (Instructional Dynamics Economics Cassette Tape 17, March 1969). Via Fischer and other new MIT professors like Rudiger Dornbusch, that rule of thumb became even more true from 1973 onward, as they turned prominent elements of Friedman's research output in the 1960s and through 1972 into part of the MIT economics mainstream. Through Dornbusch and Fischer, Friedman's positions—on the importance of the real/nominal interest rate distinction, the centrality of monetary policy for the behavior of aggregate demand and inflation, and cautions about overstating the power of fiscal policy—permeated MIT teaching and research.

Most strikingly, the natural rate hypothesis, which had challenged the Samuelson-Solow position on the inflation/unemployment relationship and which had given rise to Solow's (1969) counterattack against Friedman, was now treated as a valid critique of the original Phillips curve. Fischer (1979, p. 172) referred to the task of "trying to improve macroeconometric models… [to

[13] The interaction with, and posture toward, Friedman in Harvard University economics circles is considered in the next chapter.

take] account of misspecifications, such as those pointed out by Friedman (1968[a]) and Phelps (1967) when they discovered the role of expectations in the Phillips curve." And Dornbusch (1980, p. 162) referred to "the vantage point of modern Phelps-Friedman macroeconomics."[14] In the face of perspectives such as these from his newer colleagues, Solow (1982, p. 24) would acknowledge that "most macroeconomists" now accepted the Friedman-Phelps position on the Phillips curve, although he went on to confirm his own continued resistance to it.

Also, as Dornbusch and Fischer saw things, "a major stage in the acceptance of monetarism occurred when Friedman and Schwartz published their *Monetary History of the United States*."[15] "One of the big changes" on the teaching side at MIT, recalled Frederic Mishkin (interview, June 18, 2013), "was that Stan Fischer came when I was entering graduate school, and Stan was a huge fan of Milton Friedman's. [Though] that didn't mean he agreed with all of his policy prescriptions. So, to give you an example: When I was taking a course, my first course from Stan, he said that if you're serious about being a monetary economist, you have to read Friedman and Schwartz by your bedside every night: you have to have it [the *Monetary History*] at your bedside, and read it every night. And, in fact, I did. So, I think, with the advent of Stan coming on the faculty, that the appreciation of Friedman's work went up just tremendously… And, in fact, there was a big change in the kind of economics that was taught at MIT because of Stan's coming. It moved away from the strict Keynesian, Modigliani-Solow-type discussion of macroeconomics to ones where rational expectations was brought into the classroom [and] the emphasis was on long-run issues; and *Monetary History* was viewed as one of the classic works that had ever been written in monetary economics, and so forth. So there was really a sea change."[16]

A somewhat later MIT graduate student, Christina Romer recalled at a memorial event for Anna Schwartz in April 2013: "I remember vividly one meeting of our second-year monetary economics graduate class at MIT. The professor, Stanley Fischer, started the class by asking, "How do we know money matters?"… Finally, Stan shut down the discussion [and said]: 'Because Friedman and Schwartz showed us.'"[17]

"What happened is Stan, who was at Chicago maybe a little longer than I was, then went back to

---

[14] Dornbusch had seemed receptive to a permanently-sloping Phillips curve as recently as Dornbusch (1973, p. 894).
[15] Dornbusch and Fischer (1981b, p. 551).
[16] See also Mishkin (2007a, p. ix).
[17] C.D. Romer (2013, p. 3). See also Ball and Mankiw (1994, p. 128) for a related recollection.

MIT, where he had gotten his Ph.D.," recalled Richard Zecher (interview, September 3, 2013).[18] "… He took a lot of the things he learned in Chicago, and he went back to MIT, and he sort of 'MIT'd' them." By "MIT'ing" the concepts, Zecher explained, he meant that Fischer "gave them a different slant; but they were some of the same basic ideas. And then he trained all these guys—all these guys that are running central banks now; all trained by Stan… Maybe we could say Milton's had a tremendous impact on the heads of central banks, through Stan Fischer at MIT." (Richard Zecher, interview, September 3, 2013.)[19]

Fischer's own characterization of matters was that his period at the University of Chicago "enabled me to combine MIT's analytics with the policy relevance that Milton Friedman typified" (quoted in Blanchard, 2005, p. 249).

In the decade to 1978—which for Fischer comprised roughly six years at MIT and four at the University of Chicago—he had had ample reason to become extremely familiar with Friedman's other positions on monetary matters: that is, those extending beyond the Phillips-curve work and the Friedman-Schwartz historical research. Fischer (2017b, p. 2) would describe his earliest publications in monetary economics as "research [that] was carried out when monetarism was gaining credibility in the profession." In this early period of Fischer's career, Friedman—who would later state that "Stanley Fisher is a good friend of mine, and I have a great deal of respect for his abilities" (*Moneyline*, CNN, January 23, 1998)—would be a major source of feedback on Fischer's work on policy rules with Phillip Cooper, during the period when both Cooper and Fischer were located at the University of Chicago (see Nelson, 2020a, Chapter 8). Fischer sat in on Friedman's graduate money course (see Blanchard, 2005, p. 249), and both Cooper and Fischer were regular attendees of Friedman's money workshop. "There could be no better complement to an MIT graduate education than being a member of Milton Friedman's money

---

[18] Zecher in fact had a University of Chicago affiliation for a longer span of years (1968 to 1973) than did Fischer. But Zecher spent part of that time away from the university, taking a visiting position in Australia.

[19] Since Zecher wrote these words, some of the individuals who were MIT graduate students over the years that overlapped with Fischer's time at MIT have stepped down or retired. For example, Ben Bernanke left the Federal Reserve Chair position in 2014, Charles Bean ended his period as Deputy Governor of the Bank of England in 2014, Mario Draghi's tenure as ECB president ended in 2019, and David Wilcox retired as chief economist for the Federal Open Market Committee in 2019. However, the same span of years saw Philip Lowe move up from Deputy Governor to Governor of the Reserve Bank of Australia (in 2016)—a move that also saw Guy Debelle appointed Deputy Governor (a position that he held until 2022) after having been an assistant governor—and Stacey Tevlin become chief economist for the Federal Open Market Committee (in 2019). These individuals had also been MIT graduate students during the Fischer era. More recently, the nomination in February 2023 of Kazuo Ueda to be the next governor of the Bank of Japan has been highlighted as a new example of a Fischer student becoming a senior central banker (*Financial Times* (London), February 16, 2023).

workshop," Fischer remarked in 1986.[20] Upon moving to MIT in 1973, Fischer would develop MIT's own money workshop (see Blanchard, 2005, p. 250).

Finally, in his research using rational expectations models, Fischer produced results that were a closer heir to the Friedman tradition than the Lucas-Sargent-Wallace-Barro body of work could claim to be. This was because Fischer saw systematic monetary policy, and not just one-period monetary policy shocks, as mattering for output fluctuations (Fischer, 1977a; 1980, p. 213).

In light of the posture toward monetary issues that Fischer revealed in his writings, McCallum (1998, p. 309) would ask if there was anything that "differentiates Stanley Fischer from monetarists?" The label of "monetarist" was, however, was one Fischer rejected as a description of himself. And, indeed, Fischer did not agree with Friedman on many details of monetary analysis, while also parting company with Friedman on the desirability of the constant-monetary-growth rule. Furthermore, Fischer believed, with qualifications, in the validity of fiscal-multiplier analysis, while Friedman did not.[21] Rudiger Dornbusch was likewise in favor of much more active and, in practice, stimulative demand policies in the 1970s than the policies espoused by Friedman (see Section II below).[22] It remains the case, however, that, in forming their positions on macroeconomics, both Dornbusch and Fischer had assimilated many of Friedman's ideas on the effects of monetary policy on the economy.

Influence on textbooks

A shift similar to that observed at MIT was also occurring elsewhere in the later 1970s. It was

---

[20] Fischer (1986, p. xi).

[21] Fischer also parted company with Friedman on the lineage that Friedman (1956) saw between his restatement of the quantity theory of money and earlier University of Chicago research on money. As a graduate student at MIT, Fischer was research assistant for Don Patinkin's work that critiqued Friedman's contention, and in the resulting paper Fischer was thanked in the opening footnote, for reading older University of Chicago Ph.D. dissertations on money (see Patinkin, 1969, p. 46). Fischer recalled that Patinkin, in assigning him that task, "really made me work for that footnote. It was a pleasure, incidentally; and there just wasn't a whole lot [in the theses] that you could possibly describe as what Friedman said was a Chicago tradition. Now, it wasn't clear to me why it was so important for him to *have* the Chicago tradition. You know, otherwise, he could have said, '*I* invented something,' which he may well have done." (Stanley Fischer, interview, August 30, 2013.)

[22] Miles (1979, p. 601) described Dornbusch as an international monetarist, and Fischer (1977b, p. 60) even referred to the "simplest monetarist model, due to Dornbusch (1973)…" However, these descriptions were written in an era when contributions to the literature on the monetary approach to the balance of payments were routinely described as monetarist. These contributions gave an important role to the money demand function in the analysis and made the price level endogenous. They were therefore closer to Friedman's monetarism than to the Keynesian open-economy models of previous years. But they tended to consider issues different from those that were the focus of most of Friedman's monetarist research, and they reached conclusions that often did not coincide with Friedman's own positions on open-economy matters.

felt not only in the content of graduate teaching, but also in undergraduate textbooks. One example of the latter was an intermediate undergraduate textbook on monetary economics published in 1977 titled *Money, the Price Level and Interest Rates: An Introduction to Monetary Theory*, by Gail E. Makinen, an associate professor at Wayne State University. The text's Chapter Nine was titled "The Monetary Theory of Milton Friedman." Makinen (1977, p. 232) began the chapter, "That a chapter in a textbook is devoted exclusively to an examination and explanation of the monetary theory identified with a single individual stands as a measure of his influence and importance."

However—paralleling the case of graduate teaching, discussed above—MIT provided the most notable example of undergraduate textbooks that felt the stamp of Friedman. The first edition of Dornbusch and Fischer's intermediate undergraduate textbook *Macroeconomics* appeared in 1978. The macroeconomic modeling in the latter part of the book, particularly Part III, was developed partly from Fischer's MIT graduate-course lecture notes, rather than from his undergraduate class (Richard Anderson, interview, November 14, 2013). The many respects in which the book as a whole reflected the influence of, and underlined the importance of, Friedman's macroeconomics have been discussed in Nelson and Schwartz (2008, p. 848) and Nelson (2020a, Chapter 1).[23] As the authors themselves put it in their text (Dornbusch and Fischer, 1978, p. 520): "Much of the analysis of this book would, a few years ago, have been considered monetarist." In this respect and others, the new textbook's analysis veered sharply from prior texts: Fischer recalled that, "certainly, what was in our book was new when it came out" (Stanley Fischer, interview, August 30, 2013).

The textbook was replete with mentions of Friedman. In discussing why this was the case, Fischer observed: "Milton was very active in a *lot* of debate on policy, and particularly pushing the money-supply view. And it was in the newspapers all the time. It was very prominent. Milton *was* one of the most prominent public economists. [Here] I don't mean public-economics

---

[23] As detailed in Nelson (2020b, Chapter 15), the authors were critical of Friedman's discussion of lags in the effects of monetary policy, and they implied that he had not been consistent on the matter. Similarly, in an interview for this book, Fischer suggested that in Friedman's popular writings "there was always some damn lag that allowed you to say that everything—inflation, or growth, or whatever—was caused by money, but [one was] never sure that they were the same lags each time." (Stanley Fischer, interview, August 30, 2013.) It is suggested in Nelson (2020b, Chapter 15), however, that the Dornbusch-Fischer (1978, p. 526) criticism of Friedman along this lines may have overlooked the fact that in the early 1970s he explicitly changed his position on the amount of time it took for monetary policy to affect inflation, and that he subsequently stuck to this new, longer estimate.

In any event, the textbook's coverage of inflation became more monetarist over time, with the fourth edition stating (Dornbusch and Fischer, 1987, p. 638): "The answer to the question [of] whether inflation is a monetary phenomenon in the long run is yes."

economists; I mean, people whom the public knew about." In contrast, with regard to Paul Samuelson, Fischer observed, "Paul was not particularly interested in macroeconomics, as opposed to all the *other* things he was interested in. Paul Samuelson could have gotten the Nobel Prize in five or six areas; and Milton couldn't have." Fischer suggested that, instead, the question to ask with regard to the textbook was: "Why was there more Friedman than Modigliani?" The reason for this, Fischer said, was that "Modigliani was never as *prominent* in the public's view. I think Modigliani in many ways was as important an economist as Milton. But not for public policy." (Stanley Fischer, interview, August 30, 2013.)

Another undergraduate macroeconomics textbook, released the same year as Dornbusch and Fischer's and in practice the major competitor against it, was by another former Friedman colleague, Robert Gordon. Gordon (1978), also titled *Macroeconomics*, incorporated into its analysis the modifications to the standard macroeconomic model that were associated with Friedman: the permanent income hypothesis, the natural rate hypothesis, the real/nominal rate distinction, and heavy qualifications about the effectiveness of fiscal policy. Although Gordon was not a monetarist—and, indeed, would become extremely vehement during the 1980s in his public criticisms of particular monetarist ideas and recommendations—he consulted Friedman by correspondence on his 1978 edition's coverage of monetarism; and, as has been noted in Chapter 5, Friedman provided a public endorsement of that edition.

James Tobin's ongoing resistance

At Yale University, in contrast, James Tobin was a continuing source of resistance to the notion that Friedman's analysis should be incorporated into mainstream teaching and modeling. A recollection by Gregory Mankiw concerning Matthew Shapiro underlines this fact. At graduate school in the early 1980s, Mankiw recalled, "Matthew was a co-student with me at MIT. [As an undergraduate,] Matthew had gone to Yale, where he had worked under Tobin. He was Tobin's research assistant, I believe. And then he came to MIT, where he used to take courses with me, and we took courses from Stan Fischer. And I remember him saying this, years ago: One of the things that really struck him was a difference in attitude toward Milton Friedman between MIT and Yale at the time. When he was at Yale, he kind of grew up thinking that this guy Milton Friedman was some sort of crank at the University of Chicago; and then he went to MIT, and he found people speak about Friedman with a sort of reverence." Thus, in classes that Shapiro took, the manner in which Friedman was characterized underwent a transformation: over "a period of a

year, this guy had gone from being a crank to being one of the most revered members of the profession." (Gregory Mankiw, interview, September 24, 2013.)

Shapiro himself recalled that he was "trained as an undergrad in the Keynesian-monetarist controversies… Milton Friedman was treated adversarially, as having quite a different view from the James Tobin Yale Keynesian perspective." (Matthew Shapiro, interview, November 14, 2013). Shapiro was an undergraduate during the time when Tobin's remarks at a 1975 conference appeared in print—remarks in which he declared (Tobin, 1977b, pp. 763–764) that "monetarism is a religion, whose widespread following is a significant economic fact in its own right, whether or not its doctrines are true."

Though he wrote generously about Friedman when the latter received his Nobel prize (*The Economist* (London), October 23, 1976*a*), Tobin soon resumed hostilities. Barry Eichengreen, a graduate student at Yale University in the 1974–1979 period, remarked of Tobin's graduate monetary economics course: "As late as 1977/78, which must have been the second time I took the course… Friedman was in 'the empty chair,' metaphorically." That is, Friedman was an absent figure, against whom a good deal of the teaching was directed.[24] Eichengreen recalled that Tobin was "teaching a lot about points like '*Post hoc ergo propter hoc*?'—that came from 1970, so it was relatively recent [Tobin, 1970b]. He was concerned to show that there was no mechanical relationship between money and price or money and output; that there was of financial assets of which money was [only] one. And he presented Friedman as kind of the counterpoint to that. So what people were learning in other places in the second half of the 1970s, like rational expectations, came up in passing in the course—but was much less important than these debates about does money matter; how much does money matter; how much do we have to simplify the financial sector in order to figure out how much money matters." (Barry Eichengreen, interview, April 3, 2014.)

Another graduate student of the period, David Backus, concurred: "Friedman, I think that's true—he was the guy in the empty chair." (David Backus, interview, April 16, 2014.) However, Backus stressed that he found that Tobin was reticent when it came to comparing his views directly with those of Friedman: "I don't recall getting much insight into Friedman—or Lucas, Sargent, *et al*. Looking back, it was a pretty isolated world. We saw work by these guys, but

[24] Eichengreen's parallel here was with Clint Eastwood's use of an empty chair as though it was occupied by President Barack Obama when Eastwood laid out a critique of President Obama in a speech at the 2012 Republican party convention.

didn't know what to make of it." (Davis Backus, personal communication, April 6, 2014.) Backus indicated that, rather than from courses or from reading Tobin's written exchanges with Friedman, "most of what I got out of Tobin was just talking to him and Brainard; they were extremely generous with their time." Tobin had a research program that he was following," and "I would say what I lacked as a Ph.D. student was any sense of what this other stuff was… We [students] were just missing that line of thought. We just didn't understand what it was about." (David Backus, interview, April 16, 2014.)

Tobin's reticence on this score was evident in a discussion by Tobin and de Macedo (1983, p. 7) that took issue with the idea that "the commodity [goods] price level is an asset price, in the sense that its reciprocal is the real value of money." This was clearly a follow-up to the exchange that Friedman and Tobin had had in the November 1974 conference on monetarism. At that event, Friedman had contrasted his own position that the price of money was the inverse of the price level, with the "Keynesian or central banker" stand that the price of money was the interest rate.[25] This had provoked a reply from Tobin that Friedman's contrast reflected a superficial attitude to capital theory.[26] But the Tobin-de Maceo paper did not reference the earlier exchange or, indeed, mention Friedman at all.

Another echo of that Friedman/Tobin exchange on the interest rate occurred in Fischer's MIT graduate class. Shapiro recalled: "Stan Fischer was teaching; I guess it was the second year monetary course that Greg and I were sitting on as first-year students. And I can't remember exactly how Stan framed the question, but he basically asked, "What's the price of money?" And somehow, he made clear that the answers were either $1/P$ or the nominal interest rate. And he took a poll, and I was sitting in the front row, so I didn't see what everyone else was saying. So, apparently everyone in the class raised their hand for $1/P$ except me, (laughter) who, being a student of James Tobin, said R. Which kind of sums it [the Friedman/Tobin divide] up on theoretical points." (Matthew Shapiro, interview, November 14, 2013.)

James Tobin's tendency to avoid mentioning Friedman by name when articulating his critique of

---

[25]See Friedman (1976a, p. 316). In *Newsweek* (August 23, 1976), the figure accompanying Friedman's column did have "The Price of Money" as the label for a figure depicting the short-term interest rate. But Friedman may not have chosen the label for this figure, which in any event also plotted the inflation rate. In Instructional Dynamics Economics Cassette Tape 110 (November 1, 1972), Friedman did slip at one point into calling the interest rate "the price of money." His preference was to think of the interest rate as the price of credit, although in Friedman (1971d, p. 855) he acknowledged that the interest rate's status as the opportunity cost of money gave some substance to viewing the interest rate as a price of money. See Nelson (2020b, Chapter 12) for further discussion.

[26] See Friedman (1976a, p. 316) and Tobin (1976, p. 335).

monetarism would again display itself in an article that appeared in the *Southern Economic Journal* in early 1978. The article was based on an address that Tobin had given in Atlanta on October 18, 1976 (a few days after Friedman's Nobel award had been announced). Tobin (1978a, p. 421) opened this address by indicating he would be concerned with the transmission mechanism—"the process by which monetary policies are transmitted into changes in expenditures for Gross National Product." In the subsequent exposition, he proclaimed that "[n]aïve calculations of Fisherian real rates of interest are very unreliable indicators of financial incentives for real investment" (Tobin, 1978a, p. 426). This was a theme that had been a basis for Tobin's criticisms of Friedman going back to 1966 (see Nelson, 2020b, Chapters 12 and 13). The quantitative implications of this criticism had been amplified in the 1970s—a period in which real interest rates on securities were persistently negative, while measures of q from the stock market suggested instead an extremely high real cost for U.S. businesses in raising funds for capital spending. So Tobin was concerned with making the argument that the economically-crucial real interest rates were high, during a time when Friedman was contending, in contrast, that the cost of borrowing was low in real terms. Yet Tobin's 1978 discussion of this matter made no mention of Friedman.

In the same address, Tobin made a different but also anti-monetarist point that "inside money is… more powerful stuff than outside money" with regard to the ramifications of monetary developments for aggregate demand (Tobin, 1978a, p. 434). Tobin was therefore maintaining a position he had taken in his review (Tobin, 1965) of the *Monetary History*. On that occasion, Tobin had argued that loan creation by commercial banks was more significant for aggregate demand than a commercial-bank or central-bank purchase of bonds because the loan's existence could directly give rise to flows, which might not otherwise occur, of private-sector spending on goods and services. Both Friedman and Schwartz had responded to this line of argument in their writings since 1965.[27] But Tobin's 1978 paper did not cite these writings and, in common with the rest of the article, did not mention Friedman at all. Friedman and Schwartz nevertheless recognized the paper as a critique of their own position on money and, in revising their *Monetary Trends* in the years ahead of its 1982 publication, would take the opportunity to include what was, in effect, a short reply to Tobin (1978a). Friedman and Schwartz noted that "Tobin does not refer to any empirical evidence to support such an interpretation of his conclusions," and they argued that Tobin's theoretical outline did not adequately distinguish between predictions for

---

[27] See Friedman (1972a, p. 922) and Schwartz (1969, p. 9; p. 177 of 1987 reprint).

aggregate spending and predictions concerning the composition of spending.[28]

Tobin was less reticent during the late 1970s in naming Milton Friedman on those occasions when Tobin participated in economic debate in the public square. One instance in which naming Friedman proved unavoidable was Tobin's April 1977 joint appearance with Friedman on television. That debate is discussed later in this chapter. Another instance came in a *New York Times* op-ed by Tobin (November 20, 1977) that argued that Arthur Burns should not be reappointed head of the Federal Reserve Board. Whereas Tobin (1977b, p. 763) had made a general reference to "monetarist criticism from economists" as a factor framing recent years' Federal Reserve policy decisions, his op-ed was more specific that it was "the influence of Milton Friedman and other monetarists" that had led to the Federal Open Market Committee's monetary policy organized in terms of monetary targets. Tobin argued that, partly as a consequence, Burns had pursued too restrictive a monetary policy and should not be given a third term as Federal Reserve Chairman.

Tobin's piece did acknowledge, with considerable understatement, that Friedman himself was not "entirely satisfied" with the evolution of monetary policy under Burns. And in another article during the same period, Tobin (1977c) granted that Friedman did not think monetary policy was tight (and, indeed, had been warning of late that it was too loose). Tobin cited Friedman's *Newsweek* column of October 3, 1977, to this effect. From the column, Tobin (1977c) inferred that Friedman must believe the current rate of unemployment of about 7 percent was at or below the natural level. As it happens, modern estimates of potential output, constructed by the Congressional Budget Office, imply that the U.S. output gap actually was positive in 1977:Q3, so if this was Friedman's position, it was one supported in retrospect by the data. It is more likely, however, that Friedman—as of late 1977—simply believed that enough monetary stimulus was in the pipeline to produce an undershooting by unemployment of its natural rate in the period ahead. Indeed, U.S. unemployment kept declining well into 1979.[29]

---

[28] Friedman and Schwartz (1982, p. 32). Elsewhere in *Monetary Trends*, however, Friedman and Schwartz (1982, p. 37) did make wholly positive remarks about another 1978 Tobin discussion (published as Tobin, 1980a), in which Tobin had taken issue with the emerging literature seeking microfoundations of money-holding in overlapping-generations models. They endorsed Tobin's position that the stock of money in such models served as a vehicle for household saving but did not have the more distinctive characteristics usually associated with monetary assets. McCallum (1983) endorsed Tobin's analysis for the same reason.

[29] In discussing the early period of the Carter Administration, Karl Brunner and Allan Meltzer would portray it as one in which monetary acceleration spilled over into inflation despite the existence of continuing slack (*Wall Street Journal*, February 7, 1983). Modern gap estimates suggest slack was mostly absent after 1977:Q2, so the coexistence of slack and rising inflation was probably less pronounced in 1977 than they suggested. However, the situation Brunner and Meltzer described is also consistent with representations of the monetarist view using a New

In Tobin's book *Asset Accumulation and Economic Activity*, which appeared in 1980 but was based on lectures given in January and March 1978 (Tobin, 1980b, p. vii), he did bring to an end at least one longstanding disagreement with Friedman. Tobin's opposition to the natural rate hypothesis had come to be perceived as being behind the times, and his retrogression in some of his analysis, such as Tobin and Buiter (1976), to the simple assumption of a constant price level came in for particular criticism (see Calvo, 1985, p. 95). In the early-1978 lectures Tobin indicated that he now accepted the natural rate hypothesis (see especially Tobin, 1980b, p. 39). This indication was consistent with, but more definitive than, his remark in Congressional testimony a year earlier: "There may not be a long-term trade off betweenn the two [unemployment and inflation]."[30] The endorsement of the natural rate hypothesis in Tobin's lectures would be noted upon when the lectures appeared in book form (see, for example, Lucas, 1981b, p. 560; Grossman, 1982, p. 136).

Tobin's acceptance of the Friedman-Phelps modification of the Phillips curve made itself felt also in his subsequent usage of the terminology given in the accelerationist and natural-rate approaches to the full-employment unemployment rate. Thus, Tobin (1983, pp. 512–513) referred to the nonaccelerating-inflation rate of unemployment (NAIRU), and Tobin (1985b, p. 606) referred to the natural rate of unemployment.[31] These analytical concessions did not, however, bring Tobin much closer at all to Friedman's perspective on inflation as far as practical policy prescriptions were concerned. Tobin continued to associate much of U.S. inflation with factors other than demand conditions: indeed, as of late 1977 he viewed the U.S. economy as featuring 17 percent excess capacity (Tobin, 1977c). Tobin perceived demand restriction as an inefficient and weak, and largely unnecessary, means of removing inflation—whose appropriate remedy he continued to see as, instead, largely lying in incomes policy.

Tobin's book of lectures also signaled that he was redirecting much of his energy in research debates away from criticism of Friedman and toward challenging rational expectations macroeconomics—whose arguments against activist stabilization policy and questioning of fiscal policy led Tobin (1980b, pp. 21, 36) to give it the label of "Mark II Monetarism." Consequently,

---

Keynesian Phillips curve; for, in that case, inflation can pick up in anticipation of the output gap becoming positive in the period ahead.

[30] From Tobin's testimony of February 4, 1977, in Committee on Banking, Finance and Urban Affairs (1977a, p. 203).

[31] Tobin also used the latter term in Klamer (1984, p. 103) and in *The Economist*, April 27, 1985 (p. 26). In the latter discussion, Tobin emphasized that activist demand management could be compatible with a natural-rate framework.

when Robert Lucas published "Tobin and Monetarism: A Review Article," that highly-critical article focused primarily on the book's criticisms of optimizing rational-expectations models and of Ricardian equivalence (see Lucas, 1981). Lucas' book review did, however, pay tribute to the Friedman-Phelps development Phillips-curve analysis. And it blasted the empirical record of Keynesian economics, in a passage that Friedman would quote favorably in print in 1987.[32]

Tobin's disagreement with Friedman extended to microeconomic and public-policy issues. When others stressed the similarities of his and Friedman's welfare-reform proposals, Tobin would pour cold water on the notion of a convergence of views (see Nelson, 2020b, Chapter 13). Likewise, in the area of income taxation, Tobin stressed his differences with Friedman at a May 1976 conference. In the course of the conference proceedings, a Friedman *Newsweek* column (April 12, 1976) of the previous month—in which he had proposed that tax revenue and economic efficiency could be boosted by a large cut in income tax rates implemented in conjunction with a tightening of tax deductions—became a focus of discussion. In the resulting exchanges, Tobin concurred that the system of deductions needed overhaul but added: "If Friedman's choice—of either reduced rates or less revenue—were the only choice you offered me, I would support his proposal. I do not, however, believe that it is the only choice available." Friedman's proposal, Tobin suggested, would, in effect, "reward the people who have, by seeking and using all kinds of loopholes."[33]

Friedman was not an attendee of this conference. But it took place at a poignant location: the Hoover Institution, which Friedman would formally join about fifteen months after the conference took place. For, as indicated earlier in this chapter, in 1977 Friedman's years at the Hoover Institution began.

Friedman at the Hoover Institution

Biographical material supplied by Friedman over the years frequently gave his affiliation with the Hoover Institution in 1976—and sometimes specifically dated it to December of that year.[34] But this dating was not accurate. Soon after his relocation to California, Friedman did give a talk

[32] See Friedman (1987a, p. 13).
[33] From Tobin's remarks in Campbell (1977, p. 174).
[34] For example, the biographical sketch in Friedman (1976f) incorrectly implied that he taught at the University of Chicago while holding his Senior Research Fellow post at the Hoover Institution, and that in Friedman (1977i, p. 11) gave him as starting his Hoover Institution post in December 1976. Friedman's entry in Europa Publications Limited (1986, p. 822) described him as "Sr. Research Fellow, Hoover Inst. of Stanford Univ., 1976–."

at the Hoover Institution in January 1977 on the topic of his receipt of the Nobel award in economics.[35] But this contribution had been part of his participation in a conference. Friedman's employment proper at the Hoover Institution did not begin at that time, and he was not located at the Hoover Institution in the subsequent eight months.[36] His position as Senior Research Fellow at the Hoover Institution formally began only in the first (that is, the fall) semester of the 1977/1978 academic year. This would be a post he would hold for the rest of his life.

Friedman received his own spacious office in the Hoover Institution's building, with his University of Chicago secretary of the previous five years, Gloria Valentine, continuing as his secretary throughout Friedman's Hoover Institution era and being located in the outer office. Next along from Friedman's office, Rose Friedman also had her own permanent office (*Straits Times* (Singapore), October 18, 1980; Gloria Valentine, interview, April 1, 2013).

From the beginning, however, Friedman intended the Hoover Institution to be a base of operations, rather than a place at which he could be expected to be found on a five-day-a-week basis. Gloria Valentine recalled (interview, April 1, 2013): "There were sometimes meetings going on or seminars that he wanted to attend, and he would go to those; and he usually tried to get to the office once a week." The fact that Milton and Rose Friedman had moved into an apartment in San Francisco was significant here. Gary Becker (interview, December 13, 2013) noted with regard to Friedman's physical presence at the Hoover Institution that "he was not around a lot, because he lived in San Francisco, and if you know that area, San Francisco's not so close to Hoover: it's like a 45-minute to an hour drive, depending on traffic. So he was not there on a daily basis—not at all."[37]

But though Friedman was not as constant a presence at the Hoover Institution as his new affiliation might have suggested, it was certainly true that his move to Northern California's Bay Area was permanent. It signified a break from Friedman's former attitude which, Michael Keran

---

[35] See Friedman (1977j).

[36] During his time at the Federal Reserve Bank of San Francisco, Friedman reluctantly agreed to pay one visit to the Hoover Institution, to see his new office. "I had to coax Professor Friedman to come down and see his new office at Hoover. The inducement was to see what a very nice office he had, far better than his University of Chicago office. He came to see the office just before he went to Vermont for the spring and summer [1977]." (Gloria Valentine, personal communication, October 4, 2014.)

[37] The *Wall Street Journal* (July 17, 1978, p. 27) referred to the "Hoover Institution in Palo Alto" as being "nearby" the Friedmans' apartment in San Francisco and suggested that Friedman's commute was short. In fact, the Hoover Institution was not close to the Friedmans' apartment (nor, incidentally, was the Hoover Institution located in Palo Alto, though it was near that city), and the commute was therefore not short, even for an automobile driver who exceeded the legal speed limits (as Friedman often did).

recalled (interview, March 7, 2013), was "that this is Lotus Land and you'll never get any real work done if you come to the West Coast." Richard Muth, who had served as an associate professor at University of Chicago's business school in 1959−1964, had been a professor of economics at Stanford University since 1970 (Blaug and Sturges, 1983, p. 279). Muth recalled of Friedman's own move, "it was funny because, before that time, whenever he saw me, when I used to go to Chicago but I'd gone to Stanford, he would ask: "How are things in Lotus Land?" So, when he first moved out here, I asked him the same question." (Richard Muth, interview, May 20, 2015.)

Stanford University and the Hoover Institution

The fact that Muth and Friedman were once more affiliated with the same university reflected the fact that Friedman's move to the Hoover Institution implied a move to Stanford University as well. In a form letter sent to Friedman's correspondents notifying them of his change of address, his new address was given as "The Hoover Institution[,] Stanford University[,] Stanford, CA. 94305."[38] And when Friedman's January 1977 talk on his Nobel award was published by the Hoover Institution, the booklet's cover identified that body as "Hoover Institution • Stanford University." Indeed, a wire report on the announcement of Friedman's appointment had highlighted the Stanford University part of his new affiliation, as the story was headlined: "Friedman To Take Post At Stanford" (*Christian Science Monitor* (Boston), November 4, 1976).

These descriptions were totally accurate. Hoover Institution was indeed part of Stanford University, and, consistent with this, Friedman was issued a university identification card. Nevertheless, it deserves underscoring that, particularly in the era of the 1970s, the Hoover Institution was perceived as somewhat separate from the university. And Friedman's appointment was not a joint one. Unlike such subsequent leading macroeconomists at the university like Michael Boskin, Robert Hall, and John Taylor, he did not have a dual Department of Economics/Hoover Institution affiliation. Indeed, in a sharp reaction to a hostile profile of him that appeared in the magazine *Human Behavior*, Friedman included among his list of the article's errors the description of himself as "a professor of economics at Stanford." "I have no formal connection with the Department of Economics at Stanford," Friedman pointed out (*Human Behavior*, March 1979, p. 10). It was accurate to call him Professor Friedman, but only because he held an emeritus professorship at the University of Chicago: "an inactive and

[38] Unsigned form letter from Milton Friedman's office, dated December 15, 1976, in Arthur Burns papers, Gerald Ford Presidential Library.

uncompensated" professorship, he noted. He did not owe the title to his Stanford University affiliation, as the Hoover Institution did not confer professorships.[39]

Stanford University's Department of Economics members of the late 1970s and the 1980s, like Paul Evans (a member of the department in 1976–1984) and Kenneth Arrow (who rejoined Stanford University in 1979), did not remember Friedman attending the department's seminars or striking up much of a relationship with the overall department (Paul Evans, interview, February 26, 2013; Kenneth Arrow, interview, December 7, 2013). Indeed, as of the late 1970s, Friedman and the Department of Economics at Stanford University had had a background that was not very conducive to a close relationship: "he had a checkered history with them," Gary Becker recalled (interview, December 13, 2013). In particular, when the department had sought to hire Friedman in the mid-1960s, it had turned down Friedman's request that an offer be made to Becker as well. This inaction had helped sour Friedman's attitude to the offer, which he declined.[40]

Indeed, it warrants emphasis that, when Friedman joined the Hoover Institution, its relationship with the rest of the university when Friedman joined it was far different from that prevailing in the first two decades of the twenty-first century. In 1977 and 1978, it would still be some time before a host of senior members of the Department of Economics held joint affiliations with the Hoover Institution or when, as now, graduate students from the economics department are a regular sight in the Hoover Institution's corridors.

In the 1960s and 1970s, and into the 1980s, the Hoover Institution was much more self-contained, for the most part lacking extensive interaction with the broader university. This tendency was reinforced by the fact that many in the regular social-science departments of the university viewed the institution with suspicion, because ideological persuasion figured explicitly in the basis for its existence (*Wall Street Journal*, June 15, 1984). To be sure, the tensions between the Hoover Institution and the wider university were more severe for social sciences other than economics: for example, the Hoover Institution's foreign-policy and national-

---

[39] In addition, although Friedman sometimes made statements (see, for example, *Glasgow Herald*, October 20, 1980, and *Australian Business Monthly*, October 1993, p. 54) liable to create the impression that his work still involved grading papers or giving classes, neither of these was part of his duties after 1976 (aside from guest lectures at Stanford University, in the case of teaching). (The *Chicago Tribune* of April 2, 1978*a*, likewise said of Friedman that "he now teaches at Stanford University," which he did not. Similarly, three years later the *Boston Globe* of April 1, 1981, p. 39, incorrectly stated that Friedman "now teaches at the Hoover Institution.")
[40] For more details, see Nelson (2020b, Chapter 12).

security specialists typically took a more straightforwardly "hawkish" posture on United States/Soviet Union relations than that usually found among international-affairs experts in the political-science and history departments of Stanford University and elsewhere. But the Department of Economics' membership and Hoover Institution's economists also tended to have something of an arms-length relationship until the 1980s.

The relationship between the university and the Hoover Institution improved after the 1970s. Even in 1987, however, Friedman described the relationship between the overall university and the institution as one of "armed neutrality"—and did not, himself, stimulate good relations by adding that he would like the Hoover Institution to have "nothing to do with Stanford" (*Stanford Review*, November 1987). The more convivial relationship between the university and the institution, especially between its economists, that developed in later years make such statements now seem very jarring.

Notwithstanding the tension between Hoover Institution and the university in Friedman's first decade or so there, the number of economists with joint Hoover Institution/Department of Economics affiliations gave Friedman some degree of connection with the department over time. So did the presence of old friends in the department like Richard Muth: "I saw as much of him during that period, I think, as I ever had." (Richard Muth, interview, May 20, 2015.) And through such means as their visiting the Hoover Institution and their attending conferences that it held, Friedman developed extensive interactions with some more junior economists whose permanent Stanford University affiliations were not with the Hoover Institution. Notable among these members of the younger generation was Ben Bernanke—whose regular affiliation from 1979 to 1985 was with Stanford University's business school, but who visited the Hoover Institution in the 1982/1983 year. The upshot of these interactions was that, by the time the Friedmans wrote their memoirs, Milton Friedman could cite the proximity to the Stanford University economics department as an advantage of his Hoover Institution affiliation.[41]

Friedman's attendance of Department of Economics seminars remained extremely rare, however. Thomas Sargent was based at Hoover Institution for part or most of each year from 1985 to 2002 and was, in addition, closely related to Stanford University's economics department, sometimes with a formal affiliation.[42] With regard to Friedman's attendance at the economics department's seminars, Sargent observed, "I think I saw him at one seminar." However, Sargent noted that,

[41] Friedman and Friedman (1998, p. 563).
[42] See *http://www.tomsargent.com/personal/resume.pdf*.

additionally, "we had seminars at Hoover; he came to some of those." (Thomas Sargent, interview, January 24, 2014.)[43] Indeed, though Friedman himself moved further toward public policy and away from research in his Hoover Institution years—especially after his and Anna Schwartz's completion of their final book, *Monetary Trends*—he continued to supply comments on much of the monetary research sent to him by correspondents. All told, Friedman's presence at the institution contributed to a shift noted by Michael Boskin, in which the Hoover Institution's contribution to research had improved over the previous decade, from being in a poor state in 1974 (*Wall Street Journal*, June 15, 1984).

During the period in which he accustomed himself to the new environment in 1977 and 1978, Friedman's appearances at the Hoover Institution were somewhat more frequent than would later be the case. An incentive to come into the office in that period lay in the fact that, during the 1977/1978 academic year, the Hoover Institution had a large amount of visiting researchers who shared a University of Chicago or monetary-economics background with Friedman. Among these were Karl Brunner and Allan Meltzer, as well as Robert Barro and Michael Darby.[44]

The Carter presidency and U.S. macroeconomic policy in 1977–1978

With regard to the national scene, at the start of 1977 Friedman entertained some hopes about the economic policy likely to be pursued by Jimmy Carter, who would take office as U.S. president on January 20. As noted in Chapter 5, during the 1976 presidential election campaign Friedman had indicated he preferred Ford to Carter (and Ronald Reagan to either of them). Furthermore, Carter's principal economic adviser in that campaign had been Lawrence Klein, the pioneering Keynesian model-builder and past sparring partner of Friedman. Under Klein—and in contrast to Friedman's own perception of the appropriate prescription for the U.S. economy—Carter's presidential campaign had put considerable emphasis on the need for economic stimulus. Klein had specifically indicated: "We feel the Fed has been miserly in dealing out money. There

---

[43] John Maynard Keynes' life played a role in giving rise to an instance in which Friedman involved himself in the economics seminars of Stanford University's economics department. For the occasion in October 1991 when Keynes' biographer Robert Skidelsky was visiting the Hoover Institution, Friedman contacted Stanford University's economics department to encourage the scheduling of an additional Skidelsky talk, in its own seminar series (Gloria Valentine, interview, April 1, 2013; Lord (Robert) Skidelsky, interview, November 26, 2013).

[44] Brunner (1978, p. 649) stated: "The first draft of the paper was prepared [during Brunner's period] as a visitor at the Hoover Institution (Stanford University) during the winter 1977−8." Meltzer was also at the Hoover Institution in this year (Allan Meltzer, interview, April 21, 2013; Committee on Banking, Finance and Urban Affairs, 1978c, pp. 107−108). For Barro's and Darby's positions as Hoover Institution in National Fellow in 1977/1978, see Barro (1978, p. 569), as well as their respective online CVs: *https://scholar.harvard.edu/files/barro/files/vita_0518.pdf?m=1525874087* and *https://www.anderson.ucla.edu/Documents/areas/fac/strategy/MICHAEL%20R.%20DARBY%20CV.pdf*.

should be a more expansionary policy." (*The Sunday Sun* (Baltimore), July 25, 1976, p. K9.)

Shortly after the election, Friedman had observed in a television interview: "I believe that the best thing for this country will be if Mr. Carter can rise above his advisers, including Larry Klein, who I like and respect but don't agree with."[45] Around the same time, Friedman was under the impression that Arthur Okun would likely figure among the administration's economic personnel: he welcomed this, on the grounds that Okun was "much less extreme [and] much more balanced" than other Keynesians such as Lawrence Klein (Instructional Dynamics Economics Cassette Tape 202, November 1976, Part 1). In the event, Okun did not join the administration, while Klein did not take an official post either.

Friedman would point to someone other than himself whose economic prescriptions Carter should heed. This was the U.K. Prime Minister James Callaghan, who had declared in a Labour party conference speech of September 28, 1976: "We used to think that you could just spend your way out of a recession and increase employment by cutting taxes and boosting Government spending. I tell you, in all candor, that that option no longer exists, and that insofar as it ever did exist, it only worked by injecting bigger doses of inflation into the economy, followed by higher levels of unemployment as the next step." Friedman quoted this statement many times (see Nelson, 2009, p. 84), including in his December 1976 Nobel lecture.[46]

The notion that Callaghan had provided words for Carter to live by informed the title of Friedman's *Newsweek* column of December 6, 1976, titled "To Jimmy from James."[47] In that column, Friedman provided what turned out to be a prophetic characterization of what would ensue if the United States in 1977 pursued expansionary economic measures: "If Mr. Carter tries to put his advisers' policies into effect and succeeds in doing so—including getting the Federal Reserve System to speed up substantially the rate of monetary growth—there might be a sudden spurt in the economy and a quick reduction in unemployment. However, these good results would be temporary. By 1978 or 1979, inflation would be back in double digits and wage and

[45] *Wall Street Week*, Maryland Public Television, November 5, 1976, p. 11 of transcript. The transcript of this appearance was largely reproduced at the time in the *American Banker* (November 22, 1976). In addition, the host of *Wall Street Week*, Louis Rukeyser, used his syndicated newspaper column to summarize Friedman's position on Carter and his advisers (see *The Evening Bulletin* (Philadelphia), November 15, 1976).

[46] See Friedman (1977c, p. 460).

[47] The title carried the incorrect implication that the U.K. prime minister was more formal in his rendering of his first name than was President-elect Carter. In fact, Prime Minister Callaghan was widely referred to in his home country as Jim Callaghan. (Friedman would belatedly refer to Callaghan as "Jim Callaghan" in Friedman, 1984b, p. 29.)

price controls would be in place or in contemplation. By 1980 at the latest, unemployment would be rising sharply. As Machiavelli might say: what a way to face the 1980 election!"

In a talk he gave in Chicago during this period, Friedman suggested that the U.S. economy would face "deep and real trouble" unless Carter proved to have "the ability to rise above his campaign promises" (*Chicago Tribune*, November 18, 1976).

Friedman was to be disappointed by the fact that the Carter Administration actually pressed ahead during 1977 with advocacy of stimulus to aggregate demand. Although the administration did abandon its early proposal for a tax rebate (see Section II below), its economic policy continued to be oriented toward prompt elimination of the perceived high level of economic slack in the economy.

Another economic move on Carter's part was the announcement, on April 15, 1977, of a variety of measures intended to reduce inflation from 6 percent to 4 percent by the end of 1979 (*Boston Globe*, April 16, 1977; Nelson, 2005). As this package consisted of a series of measures intended to alter specific prices and involved no monetary policy action, it might have been expected to provoke a wholly negative reaction from Friedman. But Friedman's response to the package—which he gave in the course of a debate on April 18 with James Tobin on public television's *MacNeil/Lehrer Report*—was disarmingly benign. Friedman noted that the package was, in essence, directed at relative prices and could not be expected to achieve its stated aim of reducing inflation. But, evidently wearing his "public choice theory" hat (see the next chapter), Friedman took the president's team as understanding the monetary nature of inflation but as obliged to announce an inflation package for public-relations purposes. The president had not included monetary measures in his package, Friedman said, but that signified a recognition that the executive branch lacked authority over monetary policy. Furthermore, Friedman stressed, the fact that Carter had not proposed broad wage and price controls was to be applauded. Accordingly, Friedman observed: "I want to commend President Carter." In addition, Friedman gave a backhanded compliment to the inflation package, which was "excellent because it tries to little to do so little of the wrong things."[48] To Friedman, the package amounted to window dressing and so, though not beneficial, it was largely innocuous.

In making this judgment, Friedman took something for granted that he often did in analyzing

---

[48] *MacNeil/Lehrer Report*, PBS, April 18, 1977 (*American Banker*. April 21, 1977, p. 6).

Arthur Burns' statements.[49] This was that policymakers ascribed the same degree of importance to monetary policy in inflation's determination that he did. As has already been indicated in previous chapters, by the mid-1970s, Friedman regarded the monetary view of inflation as so strongly confirmed that he tended to assume that others accepted that view. For example, in April 1978, when confronted with a recent analysis of inflation by Michael Blumenthal, U.S. Secretary of the Treasury, that seemed to line up with wage-push views of inflation, Friedman proclaimed that "Secretary Blumenthal knows as well as you and I do that inflation does not come from trade unions."[50]

Even by this time, however, considerable evidence had accumulated in support of the conclusion that the Carter Administration did not adhere to a monetary view of inflation. In April 1978, after a year in which inflation had failed to fall below 6 percent, President Carter—who once described inflation as the result of "attitudes and habits" (quoted in Kemp, 1979, p. 97)—gave a new major speech on inflation. The president's emphasis continued to be on a nonmonetary approach to disinflation. Carter stated: "Reducing the inflation rate will not be easy, and it will not come overnight. There are no easy answers. We will not solve inflation by increasing unemployment. We will not impose wage and price controls. We will work with measures that avoid both extremes." (*Kansas City Star* (Missouri), April 11, 1978, p. 2A.)

The "measures" that Carter actually advanced in this talk consisted of wage guidelines, alongside an indication that firms should keep price increases in line with the cost increases implied by the wage guidelines. This package, of course, amounted to a revival of a Kennedy-Johnson-era measure against inflation. A year earlier, in his television appearance alongside Friedman, Tobin had lamented Carter's failure to introduce guidelines in his April 1977 inflation announcement. As Carter later would, Tobin had portrayed guidelines as an alternative to a strategy of demand restriction: "guideposts, or some other direct attempt to reduce the inflation rate and to break the hard-core momentum of the wage-price spiral that we've inherited from the past, would be preferable to the solution of keeping the economy stagnant, with… a lot of excess capacity for a prolonged period of time."[51] In reply, Friedman disputed Tobin's contention that guideposts had

---

[49] And as he would again—for example, in *Newsweek*, October 3, 1977, when Friedman discussed a recent speech by Chairman Burns.
[50] *Milton Friedman Speaks*, Episode 8, "Free Trade: Producer Vs. Consumer," April 27, 1978, p. 28 of transcript.
[51] *MacNeil/Lehrer Report*, PBS, April 18, 1977 (*American Banker*. April 21, 1977, p. 6). Similarly, earlier in the year, Tobin had qualified his tentative acknowledgment of the long-run relevance of natural-rate type results both by affirmation of the standard position (shared by Friedman) that there was a short-run unemployment/inflation tradeoff and by the contention (rejected by Friedman) that "there is another trade-off between trying to reduce inflation by incomes policies of various kinds as against trying to reduce it by holding the economy down for a long period of

worked in the United States in the 1960s. Friedman went on to provide a challenge: Could Tobin nominate another historical instance in which incomes policy had, he judged, been effective? Tobin declined to accept the challenge, prompting Friedman to remark that "you're evading my question, Jim. I want to know if you can cite a single example of a successful wage-and-price guideline policy, other than the one that you were involved in." Tobin insisted that the 1960s U.S. precedent was sufficient: "That's the one I want to copy."[52]

By April 1978, however, Carter's own embrace of guidelines was motivated by the perceived success of a different example: recent years' wage-oriented incomes policy in the United Kingdom. Ironically, therefore, Carter did adhere to Friedman's suggestion that he should pattern his approach on that of Prime Minister James Callaghan. But instead of taking a leaf from Callaghan's monetarist-inspired September 1976 *speech* on aggregate demand management, Carter was emulating Callaghan's *actual practice* of taking a nonmonetary approach to the control of inflation. Judgments concerning the success of Callaghan's incomes policy would be revised drastically when U.K. nominal wage growth and inflation surged in early 1979. As of April 1978, however, a look at the U.K. experience might have suggested that the decline in inflation in the past couple of years was testament to the value of incomes policies.

Friedman's reaction to the administration's April 1978 measures was pointed.[53] "President Carter's [anti-]inflationary package is like Hamlet without the Prince of Denmark… Inflation is not caused by trade unions, business interest[s], consumers, or oil sheiks… Inflation is a disease that has been around 1,000 years and, in all that period, only one medicine to cure inflation has been found: to hold down the rate of monetary growth and hold down governmental spending." (*Manhattan Mercury* (Kansas), April 27, 1978, p. A6.) The president's package, he later added, was "a reworked ball of nonsense" (*Bluefield Daily Telegraph* (West Virginia), May 3, 1978). In September 1978, Friedman would express frustration at Carter's failure to make reference to monetary policy on the occasions when the president discussed inflation—a tendency that Friedman suggested set Carter apart from every other "high government official in any Western country."[54]

---

time with low rates of monetary growth" (February 4, 1977, testimony, in Committee on Banking, Housing and Finance, U.S. House of Representatives, 1977b, p. 203).

[52] *MacNeil/Lehrer Report*, PBS, April 18, 1977 (*American Banker*. April 21, 1977, p. 7).

[53] The administration had earlier in this year foreshadowed that it would be focusing its approach to inflation on voluntary wage-price guidelines—an approach Friedman had criticized as window dressing" (*Chicago Daily News*, February 21, 1978).

[54] Friedman (1978c, p. R–182).

This tendency continued in the following month. In October 1978, with U.S. CPI inflation approaching 9 percent, Carter announced yet another anti-inflation package, in which he broadened his wage-price guideline proposals. The deterioration in inflation performance over the previous eighteen months was reflected in the fact that, whereas in April 1977 Carter had sought to get inflation down to 4 percent in 1979, now he merely hoped to bring the inflation rate in 1979 back down to about 6 to 6.5 percent (*Financial Times* (London), October 25, 1978).

The devices in Carter's October 1978 package advanced to achieve this goal included voluntary wage guidelines, voluntary price guidelines, and a "real wage insurance" scheme (*Omaha World Herald* (Nebraska), October 25, 1978). The last of these proposals, which the administration continued to promote into 1979 (see Committee on Ways and Means, U.S. House of Representatives, 1979, and Romer and Romer, 2002b, p. 62), would provide tax relief, for those employees who adhered to the wage guidelines, if realized inflation proved to be high in relation to the guidelines. It was therefore a variant of the "tax-based incomes policy" idea of which Friedman was so derisive (see Chapter 5 above). As it required Congressional approval that was not forthcoming, the real-wage-insurance idea was not enacted (Biven, 2002, p. 189). However, the Carter administration continued its wage-price guidelines beyond 1978. Friedman was concerned that, ultimately, the administration's advocacy of guidelines could "soften the ground for another dose of wage and price controls" of the mandatory variety (*Chicago Daily News*, February 21, 1978).

II. ISSUES RELATED TO DEBATES ON MONETARY POLICY AND MACROECONOMIC STABILIZATION, 1977–1978

CROWDING OUT AND RICARDIAN EQUIVALENCE

Underlying the Carter Administration's approach to inflation in 1977−1978 was the view that high inflation did not reflect a problem of excessive aggregate demand, nor did the cure for inflation lie in restriction of aggregate demand. Indeed, as the administration saw things in these years—particularly during 1977—the U.S. economy had too little, not too much, aggregate demand. This attitude shaped the administration's early moves in the area of fiscal policy.

As of late 1976, Friedman seemed confident that Carter would discard his pre-election commitments to introduce stimulative measures. Friedman thought he observed in Carter's post-election press conference the start of a "gradual withdrawal from his pre-election promises" to

stimulate the economy—a process that he believed would see a "neatly-staged retreat from those positions" (Instructional Dynamics Economics Cassette Tape 203, November 1976, Part 2). As for the policies that Carter should actually follow, Friedman stated: "The advice that I would give to Jimmy Carter is exactly the advice I would give to Gerald Ford, and exactly the advice that I would give to anybody else: What this country needs is less government spending, not more; what we need is to let people spend more of their own money instead of first sending it to Washington, taking a commission off and then sending a small part back..." (*Donahue*, NBC, November 24, 1976.) In particular, Friedman denied the need for stimulus, arguing that the economy was "pretty strong… [W]e're in a good expansion."[55]

On taking office, however, the Carter Administration proceeded with plans to stimulate the economy. In a discussion of the history of U.S. fiscal measures designed to affect aggregate demand, Romer and Romer (2010, p. 764) conclude: "Tax actions… were common in the early postwar era but virtually disappeared after 1975." This is an accurate description of *implemented* tax measures in the quarter-century after 1975. However, it is notable that, early in its existence, the Carter Administration *attempted* to enact a prominent demand-stimulating tax measure.[56] Shortly after taking office, Carter proposed implementing a $50-per-household tax rebate. This rebate (more precisely, a transfer, one proposed to be disbursed even to those who lacked any tax liability) was advanced to be put into effect in the second quarter of 1977 (*New Republic*, May 7, 1977, p. 11).

Friedman had poured scorn in his first *Newsweek* column for 1977 on "the implicit assumption of so much current talk… that a tax cut or an increase in government spending is 'stimulative'" (*Newsweek*, January 10, 1977, p. 59). When the rebate proposal was formally advanced a few weeks later, Friedman was, not surprisingly, strongly negative in his reaction (*Los Angeles Times*, February 10, 1977, p. 21; *New York Times*, February 28, 1977; *U.S. News and World Report*, March 7, 1977).[57]

---

[55] *Wall Street Week*, Maryland Public Television, November 5, 1976 (*American Banker*, November 22, 1976, p. 6).
[56] This measure—which, as discussed below, was not enacted—aside, the first two years of the Carter Administration did see implementation of a couple of packages that contained some tax-cutting element and that were motivated in part by a wish to stimulate aggregate demand. See the coverage of the Tax Reduction and Simplification Act of 1977 (enacted in May 1977) in Romer and Romer (2009, pp. 61−62) and of the Revenue Act of 1978 (enacted in November 1978) in Biven (2002, p. 199), Romer and Romer (2009, pp. 64−65) and Eizenstat (2018, pp. 314−320).
[57] He briefly covered the rebate plan in his *Newsweek* column (April 11, 1977). Friedman also criticized the plan on the daytime talk program *Dinah*! (Dinah Shore show) on March 23, 1977.

This negative reaction had two branches: one that pertained to a case in which the tax rebate was monetized; the other that referred to the likely effects of the rebate if it turned out to be a "pure" fiscal policy measure—that is, if it was not accompanied by extra money creation.

As far as the monetary side of the tax proposal was concerned, it is important to bear in mind that—at this stage of his understanding of U.S. historical regularities—Friedman still regarded the typical pattern as one in which budget deficits were accommodated by monetary policy (*Financial Times* (London), January 6, 1977; *St. Louis Globe-Democrat*, December 16, 1977; *Newsweek*, April 24, 1978). This background made him think it likely that a rebate *would* prompt an increase in the U.S. money stock. That this was not an unreasonable expectation, whatever the historical evidence said, was underlined by the fact that Federal Reserve Chairman Arthur Burns—although he was critical of the rebate proposal—indicated that the Federal Reserve might allow the money stock to rise, on a one-time basis, with the tax rebate (*Daily News* (New York), March 23, 1977). Furthermore, Burns had confirmed that he intended to follow policies consistent with Carter's announced goals of 6 percent real GNP growth in 1977 together with an unemployment rate of around 6 to 6.5 percent by year-end, compared with the value of about 7.5 to 8 percent believed to be prevailing when Carter was elected (*Omaha World Herald* (Nebraska), November 24, 1976; *Los Angeles Times*, February 4, 1977). In the event that it was monetized, Friedman said, the tax rebate would be inflationary.

For the case in which the federal borrowing arising from the rebate was not monetized, Friedman saw the measure as unlikely to be effective in stimulating aggregate demand. This was, of course, the same position that he had taken on previous instances when the federal government had attempted countercyclical fiscal measures—including the Ford Administration's tax rebate in 1975.

The way in which Friedman in 1977 articulated his skepticism about fiscal policy is notable, in light of what has subsequently been said of his views. In a February 2010 blog entry, J. Bradford DeLong declared that while "Friedman was a critic of fiscal policy," it was a violation of "Milton Friedman's model" to argue that the ineffectiveness of fiscal policy reflected the notion that attempts at fiscal stimulus amounted to "taking money from one place and giving it to another place."[58] This confident statement by DeLong should be juxtaposed against Friedman's actual words, given in response to the Carter rebate proposal: "How can the government

[58] Bradford DeLong, J. Bradford DeLong blog, February 22, 2010.

stimulate the economy by taking money out of one pocket of the public and putting it into another pocket?" (*U.S. News and World Report*, March 7, 1977.)[59]

Crowding out

What were the economic mechanisms that Friedman saw as working against the effectiveness of fiscal-stimulus measures like a tax rebate? The answer to this question was something on which his views were shifting in the late 1970s. The empirical evidence had long convinced Friedman that fiscal measures on their own were, by and large, ineffective in influencing aggregate demand. But his conception of the fundamental reasons why this was the case was changing over this period—from one emphasizing crowding out, to one stressing Ricardian equivalence.

"Crowding out" summarized the process in which fiscal actions that boosted disposable income or public spending had their effect on aggregate demand largely offset by interest-rate-raising effects of the accompanying increase in government borrowing and the resulting downward pressure on interest-elastic private spending. By 1977, crowding out was a well-established part of public discourse on macroeconomic management in the United States. For example, Snellings (1976, p. 6) noted: "Some well-informed observers fear the 'crowding out' of private borrowers that was so much-talked-about last year." Much of the credit for the popularization of the concept went to President Ford's Secretary of the Treasury, William Simon, who had triggered media and Congressional discussions of crowding out by suggesting in 1975 that it was a likely implication of actual U.S. federal deficits.[60]

Ahead of Simon, however, Friedman had promoted the notion of crowding out for many years in research and public-policy discussions. For example, in November 1968, he observed: "The state of the government budget has a considerable effect on interest rates. If the federal government runs a large deficit, that means the government has to borrow in the market, which

[59] Friedman employed similar imagery in *Los Angeles Times*, February 10, 1977, p. 21, and in *New Guard*, April 1977, p. 6.
[60] For example, a *Wall Street Journal* editorial (March 13, 1975) titled "Crowding Out" stated that Simon "sounded the first guns in this debate," while financial columnist Sylvia Porter contended (*Detroit Free Press*, August 20, 1976) that the crowding-out "theory [was] promoted by Treasury secretary William Simon." Later, a textbook discussion (Wonnacott and Wonnacott, 1979, p. 255) associated Simon with a belief in the practical relevance of crowding out, while Silk (1982, p. 237) even asserted that Simon "became famous for inventing 'crowding out.'" Simon's own principal exposition of crowding out was in testimony of March 3, 1975, in Committee on Ways and Means, U.S. House of Representatives (1975, pp. 24–25). See also his op-ed in *Washington Star* (Washington, D.C.), May 4, 1975.

raises the demand for loanable funds and so tends to raise interest rates."[61] It was against the background of such statements that Benjamin Friedman had occasion in 1978 to refer to "the 'portfolio crowding out' emphasized by Milton Friedman."[62]

In discussing the most recent calls for fiscal activism, Friedman's *Newsweek* column of January 10, 1977, cited the failure of the 1968 tax increase to stop inflation as evidence of the unreliability of fiscal measures in affecting aggregate demand. That 1968 episode had, indeed, been a considerable watershed in creating support among economists for Friedman's skepticism about fiscal policy. But, although retrospectives tended to point to the temporary character of the fiscal measure as the reason for its apparent failure, Friedman himself had in 1968 had appealed to reverse-crowding-out, rather than his own permanent income hypothesis, as the basis for predicting that the tax increase would fail to brake aggregate demand.[63]

Just as in his analysis of the 1968 tax surcharge, Friedman's critiques of President Carter's proposed tax rebate largely cast its likely ineffectiveness in terms of crowding-out mechanisms. He granted that the rebate would, if enacted, lead to "extra expenditures by consumers" (*U.S. News and World Report*, March 7, 1977). But the associated government borrowing, he contended, would lower aggregate U.S. saving (*Newsweek*, April 11, 1977) and reduce U.S. businesses' investment expenditures (Instructional Dynamics Economics Cassette Tape 206, January 1977, Part 1).

The permanent-income/Ricardian equivalence alternative

In 1977, just as in 1968, it fell to a Keynesian, Robert Eisner, rather than to Friedman, to emphasize the permanent income hypothesis, rather than crowding out, as the reason for the likely ineffectiveness of the proposed fiscal measure. On February 7, 1977, in testifying about the rebate proposal to the House of Representatives' Committee on Ways and Means, Eisner

---

[61] From his remarks in Friedman and Heller (1969, p. 50). Early public statements in which Friedman emphasized the upward pressure on interest rates generated by unmonetized fiscal deficits included his remarks in Samuelson and others (1952, p. 389; also in Joint Committee on the Economic Report, U.S. Congress, 1952a, p. 1299) and his Congressional testimony of January 31, 1952 (see Joint Committee on Economic Report, U.S. Congress, 1952b, especially pp. 334–337) and March 1952 (see Joint Committee on Economic Report, U.S. Congress, 1952c, p. 690).
[62] B.M. Friedman (1978a, p. 598).
[63] In particular, he did so in his 1967 discussions of the matter, which are cited and discussed in Nelson (2020b, Chapter 13). In addition, in Friedman and Heller (1969, p. 50), he said that the decline in interest rates following the introduction of the 1968 tax surcharge was "precisely what we had predicted and what our analysis leads us to predict."

observed: "I have to recall to you the theory of Milton Friedman, who points out in his permanent income hypothesis that people's spending is most influenced by the long run, or permanent, income, and not by temporary income changes."[64] Eisner noted that the 1968 tax surcharge had been associated with a reduction in the saving ratio and the 1975 tax rebate by a surge in the ratio—patterns that suggested that consumers rode out the changes in taxes.[65]

Buttressing Eisner's position was something that Friedman acknowledged on television in April 1977: the fact that "interest rates are relatively low," as they were in nominal terms (compared with the recent past) and especially real terms (compared with most of twentieth-century U.S. history)—in the mid-1970s. He acknowledged that this fact created a problem for the use of crowding-out story as the explanation for why the fiscal deficits already recorded in the mid-1970s might not have been stimulative, on net, for private aggregate demand.[66]

Thus, as between portfolio crowding out and the permanent income hypothesis, the latter seemed to have considerably more appeal by the late 1970s in understanding the limitations of taxes as a demand-management tool. Furthermore, in 1978, the permanent income hypothesis was given a modern cast by Robert Hall's (1978b) derivation of the consumption function in an infinite-horizon model. Although Hall treated real interest rates as constant in his analysis, research of around the same vintage by Boskin (1978) provided evidence that saving (and so consumption) significantly depended on the real interest rate—a position that Friedman had long advocated.[67] Thus, this period saw the basic ingredients of the New Keynesian IS function—a permanent-income infinite-horizon consumer model and interest-elastic consumption (as well as investment) expenditures—laid out in research studies. This approach to modeling private behavior affirms that measures such as tax rebates will fail to affect aggregate demand. And it does so because of the permanent income hypothesis, and in particular a particular corollary of that hypothesis: what in the late 1970s came to be known as Ricardian equivalence.

Moving toward acceptance of Ricardian equivalence

The puzzle is why, as the architect of the permanent income hypothesis, Friedman himself did

---

[64] In Committee on Ways and Means (1977, p. 498).
[65] Similarly, Franco Modigliani, in testimony at another hearing the same day (see Joint Economic Committee, 1977, p. 158) suggested that the 1975 tax cut had primarily been saved. However, as discussed in Chapter 4, in his later research, such as Modigliani and Sterling (1986), he went back to a more traditionally Keynesian position that the 1968 and 1975 tax changes had indeed sizably affected household spending.
[66] *MacNeil/Lehrer Report*, PBS, April 18, 1977 (*American Banker*, April 21, 1977, p. 10).
[67] On the last point, see Nelson (2020a, Chapter 5).

not in 1977 deploy the hypothesis when he criticized the Carter rebate proposal. It was not for lack of understanding of the implications of the permanent income hypothesis for temporary tax measures. Those implications—which were embedded in Ricardian equivalence—had been spelled out by Barro (1974). As mentioned in Chapter 4 above, Barro had presented this formal outline of Ricardian equivalence at Friedman's money workshop at the University of Chicago in 1973. In the course of the discussion of Barro's paper, Friedman eventually sided with Barro on Ricardian equivalence against the skeptical reaction expressed by other participants, notably Gary Becker, in the workshop (Barro, 2007, p. 133). And before this, in 1969, Friedman had affirmed in 1969 that the notion of an infinite horizon might be the right setting in modeling a household, via his statement that it was irrational not to care about one's heirs.[68]

Furthermore, even before Barro's formalization of the idea, the notion of Ricardian equivalence had run through many discussions of fiscal policy. In 1977, the concept's venerable status in economics analysis was underlined by O'Driscoll's (1977) pinpointing an exposition of the hypothesis made by David Ricardo. But even in the quarter-century to 1974, Ricardian equivalence had been a recurring feature of theoretical discussions of the effects of fiscal policy. Barro (1974, p. 1096) had himself offered a number of quotations to this effect. In addition, Modigliani (1964a, p. 483) had referred to the hypothesis as a familiar one: he had observed that it was a widespread proposition that in conditions of certainty, perfect credit markets, and infinite horizons, "tax finance and loan finance must have identical effects," and in particular the "consumption pattern would be the same in both cases." And Patinkin (1967, p. 11) suggested that "whether government interest-bearing securities… [are] a net asset of the private sector" was an issue "increasingly discussed in recent years."

In addition, and notably, an extended analysis of pre-1974 discussions of Ricardian equivalence by Elmendorf and Mankiw (1999, pp. 1643−1644) drew attention to a passage in the second edition of Patinkin's *Money, Interest, and Prices* (see Patinkin, 1965, p. 289) that implied that Patinkin had first learned of the idea of Ricardian equivalence indirectly from Friedman— via Patinkin talking to Carl Christ, who had attributed the idea to Friedman). [69] The textual evidence,

---

[68] Friedman (1969a, p. 23).
[69] Elmendorf and Mankiw very strongly implied that Patinkin must have learned of the hypothesis during the year in which he, Carl Christ, and Friedman were all located at the University of Chicago—that is, the 1946/1947 academic year. However, the evidence cited by them gives little support for this speculation, for the Patinkin passage in question was not in the original, 1956, edition of Patinkin's *Money, Interest, and Prices*; rather, it first appeared in the 1965 edition (with Beard and Johnson, 1974, specifically noting it as an addition). In fact, one can go further and locate Patinkin's digestion of the idea as occurring in 1957.

however, indicates that Patinkin actually meant that he was exposed to the idea due to its presence in Christ's (1957) article (a review of the first edition of *Money, Interest, and Prices*). In that review, Christ mentioned the tax-anticipations idea and stated that he'd been alerted to that idea by "a discussion with Milton Friedman" (p. 349).[70]

Friedman had also recognized the Ricardian-equivalence scenario in print when, in 1970's *Monetary Statistics*, he and Schwartz had noted that government debt would not count as part of individuals' (net) real wealth if "individuals are regarded as treating the obligation to pay taxes to finance interest payments on government debt as a liability."[71]

By the early 1970s, Friedman was, in fact, including Ricardian-equivalence mechanisms in his list of reasons for expecting little response of total spending to arise from fiscal stimulus.[72] He did this most notably in his contribution to the 1972 *Journal of Political Economy* symposium on monetary theory. It was largely on the basis of this 1972 contribution that Roley (1981, p. 22) suggested that "Milton Friedman also appears to rely on the ultrarationality assumption [that is, Ricardian equivalence] in describing the ineffectiveness of bond-financed fiscal policy."[73] But as he had indicated in a 1970 discussion (Instructional Dynamics Economics Cassette Tape 61, November 18, 1970), the actual outcome Friedman anticipated in the wake of a tax-cut-induced budget deficit was a mixture of an interest-rate rise and Ricardian reactions (in which, in effect, the tax cut proceeds were used to buy bonds) and Friedman's 1972 article was consistent with this, as it had still counted downward pressure on interest rates as one effect of a tax increase—so it was not actually, at this point, ruling out crowding-out channels entirely.[74] Similarly, Tobin (1976, p. 335) was jumping the gun somewhat when he pointed to a Friedman *Newsweek* column

---

[70] Carl Christ was an associate professor at the University of Chicago in 1955−1961 (American Economic Association, 1981, p. 96), so there were abundant opportunities for Christ to talk about fiscal policy with Friedman after 1946. (Patinkin, 1965, p. 288, actually cited Christ, 1957, but did not make it completely clear that his discussion on page 289 of Carl Christ's views was also a reference to the 1957 Carl Christ article.) The fact that Patinkin (1967, p. 11) associated the discussion of the Ricardian-equivalence idea specifically with Mundell (1960) reinforces the likelihood that Patinkin did not perceive Friedman as having floated the notion at a point very much earlier than the early 1960s.

[71] Friedman and Schwartz (1970, p. 135). They continued to acknowledge that government debt entered official measures of net wealth (see Friedman and Schwartz, 1982, p. 277). But this was just a factual statement about the statistics, with Ricardian equivalence casting doubt on the conceptual validity of the statistical classification.

[72] In addition to the items discussed presently, see Friedman's remarks in Instructional Dynamics Economics Cassette Tape 91 (January 26, 1972).

[73] In addition, Gowland (1983, p. 61) referred to "the Chicago doctrine that individuals discount their future tax liabilities." This might simply be a reference to Barro (1974), but it could also be an allusion to the statements supportive of Ricardian equivalence made over the years by Friedman (as well as by Lucas, 1981).

[74] Correspondingly, Benjamin Friedman (1978) had specifically cited Friedman (1972a) as having advanced the crowding-out position.

(January 27, 1975*a*), as having made Ricardian equivalence “a central argument” against fiscal policy as a stabilization device. For a subsequent Friedman *Newsweek* column (May 12, 1975), though acknowledging as a special case that in which new bond issuance by the federal government “can be regarded as advance receipts for future taxes!,” affirmed that a tax cut would in practice tend to raise interest rates, as it would not be fully saved.

What seems to have been a stumbling block preventing Friedman’s putting Ricardian equivalence front and center, both in these discussions and again in his 1977 critique of the rebate, is that he was not quite ready to accept an infinite-horizon approximation as the baseline assumption for the analysis of the private sector’s reaction to fiscal measures. As of 1977, he was still inclined to view the evidence as balanced in favor of the presumption that U.S. households did not fully offset changes in public-sector saving with their own saving decisions. He was likely broadly sympathetic at this stage with the work in the area by Martin Feldstein. Feldstein had argued that Social Security taxes reduced U.S. private capital formation (see Feldstein, 1974b—work Friedman mentioned in Instructional Dynamics Economics Cassette Tape 174, August 1975, Part 2) and who had debated Barro on that issue.[75]

Even in early 1977, Friedman was, however, exhibiting further moves in the direction of empirical acceptance of Ricardian equivalence. This was evident when he stated that a bond-financed tax cut raised future interest payments of the government, but without specifically claiming that a tax cut pushed up interest rates (*Newsweek*, January 17, 1977; *U.S. News and World Report*, March 7, 1977). The shifting of Friedman’s views on the matter was also evident in the contrast between his statement in February 1974 that increased government borrowing “will mean still higher interest rates” (*Chicago Tribune*, February 6, 1974, p. 7) and his statement in September 1977 that non-monetized federal deficits amounted to “taxes that will be imposed on wealth to pay back interest on the debt or the debt itself” (*Lubbock Avalanche-Journal* (Texas), September 29, 1977).

[75] See Barro and Feldstein (1978). Friedman’s sympathy with the Feldstein results did not signify a rejection of rational expectations. Indeed, Feldstein pointed out (especially in Feldstein and Pellechio, 1979, p. 362) that he was resting his theoretical basis for rejecting Ricardian equivalence not on consumers being irrational but, instead, on the empirical importance of deviations from an infinite-horizon framework. (In the case of Social Security specifically, the opposite, Barro, position was that households—having infinite horizons—would make saving plans that offset the effects on nationwide saving, and on the allocation of resources across generations, associated with payroll taxes and other Social Security arrangements. This behavior, in turn, would lead capital formation to be unaffected by Social Security arrangements. See especially Barro and Feldstein, 1978, and Boskin and Kotlikoff, 1985.) In time, however, Friedman would become more comfortable with the infinite-horizon baseline, and so he moved away from the Feldstein side to the Barro side of the Ricardian-equivalence debate.

In a short span of years after 1978, Friedman would move to, essentially, complete acceptance of the Ricardian equivalence proposition as the baseline hypothesis. Friedman had a vigorous informal debate with Robert Hall on the consumption function in conversation at the Hoover Institution during 1978/1979 (Levis Kochin, interview, April 23, 2013).[76] Not only would he become persuaded by the analytical arguments put forward by Barro and Hall; but also, he came to be further convinced that the real-interest-rate/budget-deficit relationship in the United States in the 1970s had not, in fact, borne out the predictions implied by the crowding-out story that he and others had expounded.[77]

In sum, although doubts concerning the power of fiscal policy were a perennial feature of Friedman's analysis from the early 1950s onward, it was only after the 1970s that the permanent income hypothesis really achieved pride of place as the basis for his doubts. He would then believe, as he had before, that moving money from one pocket to another was not stimulative. But he would come to see this experiment in terms of shifting funds between a pocket in the present and a pocket in the future.

President Carter's abandonment of the rebate proposal

President Carter withdrew the tax rebate proposal in mid-April 1977 (*Boston Globe*, April 15, 1977). Dornbusch and Fischer (1978, p. 546) observed that the abandonment of the rebate idea was partly because of good readings on U.S. economic activity. They added, however, that a consideration weighing against the rebate was "the question of whether transitory tax cuts or rebates are really effective in stimulating aggregate demand." Indeed, another textbook account—Gordon (1978, p. 487)—maintained that the rebate would likely have been saved. Gordon therefore largely endorsed the Ricardian-equivalence account, in this case. However, notwithstanding the respect with which the economics profession, by this stage, already treated the permanent income hypothesis, there remained widespread adherence to an old-Keynesian belief that the rebate would have been powerful. For example, in the period preceding the plan's withdrawal, the Wharton econometric model's forecast had predicted that the rebate would boost consumption and output in the second and third quarters of the year (*Daily News* (New York), March 25, 1977). And, after the plan's withdrawal, Tobin (1978b, p. 20) lamented the opposition the rebate had received and claimed that the "rebate in 1975 had been instrumental in launching the recovery." Robert Solow, while conceding that doubts about the effectiveness of

[76] Kochin was a National Fellow at the Hoover Institution in 1978/1979: see *https://econ.washington.edu/file/2154/download?token=ZwqbbCcm.*
[77] see Chapter 9 below

rebates had grown in the economics profession, suggested that "a $50 rebate might be spent rather quickly" (*New Republic*, May 7, 1977, p. 13.)

Solow criticized the "infirmity of purpose" behind the rebate's withdrawal (*New Republic*, May 7, 1977, p. 13). Indeed, when she came to office as Prime Minister of the United Kingdom two years later, Margaret Thatcher viewed Carter's reversal on the rebate as a lesson on what not to do, on the grounds that backing down from a publicly-stated position amounted to a lack of resolve (Young, 1991, p. 129). In 1977, however, Friedman offered a more favorable interpretation of the president's move than that embedded in these assessments. "I think it speaks extraordinarily well for President Carter's capacity to adjust his plans to circumstances," Friedman remarked shortly after the rebate's cancellation. "It's very, very hard for any of us to admit that we're wrong, and to withdraw from a position in which we have gone." (Instructional Dynamics Economics Cassette Tape 211, April 1977, Part 1.)

Subsequently, it became rare for Friedman to speak so highly of President Carter. The April 1977 praise arose partly because Friedman took Carter's move as an acceptance that stimulation of aggregate demand was no longer appropriate. It would, however, become clear that this was not the case. In his commentary on the rebate's withdrawal, Solow implied that demand-stimulating measures were still needed (*New Republic*, May 7, 1977, p. 13). The Carter Administration shared this view, and it continued to support expansionary measures after April 1977, in both the fiscal sphere and the monetary sphere.

THE SECOND MONETARY EXPLOSION

As recounted in Chapter 5, in the year to December 1976, CPI inflation in the United States was slightly below 5 percent. This rate, the lowest since 1973, implied a decline in inflation of over seven percentage points from the peak in late 1974. That considerable achievement set the tone for much economic commentary in late 1976 and into 1977—in which it was suggested that, although no further decline might be in prospect, the reduction in inflation seen during 1975 and 1976 would, essentially, be maintained. For example, one financial commentator wrote in late 1976 (*Bankers Monthly* (November 15, 1976, p. 2): "Inflation is likely to remain in the 5½ percent range over the coming year." Once, in early 1977, inflation had shot back above 6 percent, the same commentator remained sanguine, observing (*Bankers Monthly*, July 1977, p. 2): "Price inflation has slowed predictably from its unsustainable, weather-induced first-quarter pace. Consumer prices should advance at a rate no faster than the 5½–6 percent official estimate

in the second half of this year." Over in *Forbes* magazine, an analysis of inflation had recently been very optimistic about the prospects for inflation, with the article concluding: "Inflation, where is thy sting?" (*Forbes*, May 1, 1977.)

A dissenter from this consensus was Milton Friedman. He was far less optimistic. To Friedman, it seemed that a sharp and lasting *rise* in U.S. inflation was likely to occur in the coming years. In mid-1976, he proclaimed that the decline in the U.S. inflation rate had either come to an end or very shortly would (Instructional Dynamics Economics Cassette Tape 192, June 1976, Part 1). Speaking about six months later, in early December 1976, Friedman predicted that inflation would trough around February 1977 (Instructional Dynamics Economics Cassette Tape 204, December 1976, Part 1).

Friedman went further, making quantitative predictions. In that early December 1976 commentary, for example, he asked, "What will be the rise in the CPI over the next expansion? … [T]he prediction I came out to was an average rate of rise over the next expansion of 7 to 9 percent."[78] He specified this prediction as pertaining to the period from February 1977 to early or mid-1979. A month later, Friedman observed (*San Francisco Examiner*, January 5, 1977): "I'm hesitant to give any number [but] the probability is for 7 or 8 percent at the end of 1977 or in 1978." On television in mid-April 1977, Friedman said of inflation, "I expect it's going to step up in the next year or two to 7 percent or 8 percent."[79]

Around October 1977, with the accrual of several months' monetary data having given Friedman the material with which to extend his forecast, Friedman predicted that the overall average rate of inflation from mid-1977 to mid-1979, he suggested, would average 7 to 9 percent. He added that it was "now too late to do much about the rate of inflation over the next couple of years," as it was going to reflect monetary policy actions that had already been taken. [80]

Friedman had also specifically indicated that a return of inflation to the double-digit range was in prospect for 1979 and 1980 (*Newsweek*, October 3, 1977).

In February 1978, Friedman predicted that the peak of inflation in 1979 or 1980 could well

---

[78] Friedman also gave the 7 to 9 percent number in a keynote talk at the Bay Area Council 1977 outlook conference on January 25, 1977. See *Contra Costa Times* (Walnut Creek, California), January 26, 1977.
[79] *MacNeil-Lehrer Report*, PBS, April 18, 1977 (*American Banker*, April 21, 1977, p. 6).
[80] Friedman (1977a, p. 23).

exceed 12 percent and would come in the wake of rates of 7 to 9 percent in 1978.[81] Friedman elaborated in April 1978 that double-digit M2 growth during 1977 had led him to judge that "inflation from February 1977 to October 1979 will average something like 7 to 10 percent… [and] no sustained reduction in inflation can be expected before mid- or late 1979." (*Newsweek*, April 24, 1978.) The following month, in an appearance at the Economic Club of Detroit, Friedman made other specific predictions. The United Press International report on this speech opened by observing: "Economist Milton Friedman says the U.S. economy will fall into a major recession by 1980 after a period of double-digit inflation next year." The article quoted him specifically saying that inflation "probably will be eight or nine percent by the end of the year—and may be into double digits in 1979" (*Kenosha News* (Wisconsin), May 19, 1978).

And Friedman would be vindicated. These various predictions—which differed in the vantage point at which they were made, numerical specificity of the forecast, and the time frame to which the forecast referred—would have in common the property that they proved accurate. Friedman's pessimistic picture of how inflation would evolve over the rest of the 1970s would indeed be realized.

Having crossed above 6 percent in February 1977, the twelve-month CPI inflation rate did not go below 6 percent again until August 1982. In May 1978, it moved above 7 percent, in September 1978 above 8 percent, at the end of 1978 it hit 9 percent, and during 1979 it passed through the 10, 11, and 12 percent barriers, moving above 13 percent at the end of the decade. In terms of averages, Friedman's prediction of 7 to 9 percent inflation, which Friedman had predicted first for February 1977 to mid-1979 and later for 1978 alone, was met for both periods: the average quarterly annualized inflation rate was 8.6 percent for 1977:Q1−1979:Q2 and 8.9 percent for 1978. In contrast, as 1978 approached professional forecasters' consensus prediction for that year's inflation rate was about 6 percent (*U.S. News and World Report*, August 7, 1978, p. 17; *Wall Street Journal*, October 1, 1979).

Long-term interest rates

Friedman's accurate prediction that the late 1970s would see a sharp rise in inflation and, indeed, a renewed period of double-digit inflation contrasted sharply with the assessments of inflation prospects underlying trading in the bond market. In the final quarter of 1976, the ten-year

---

[81] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," February 6, 1978, p. 24 of transcript.

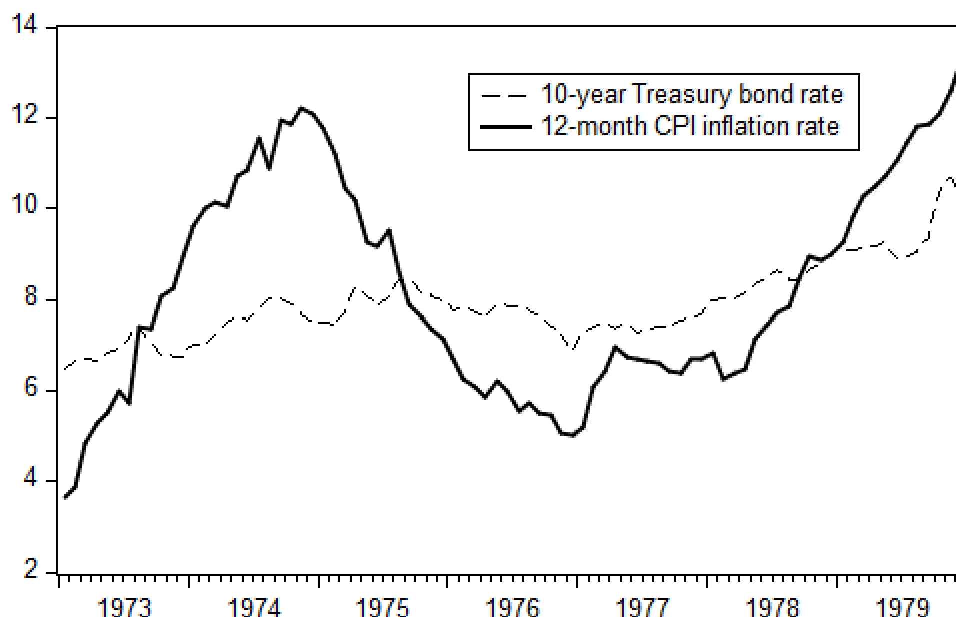

Figure 1. Ten-year Treasury bond rate and twelve-month CPI inflation rate, January 1973 to December 1979.
Source: Federal Reserve Bank of St. Louis' FRED portal.

Treasury bond rate averaged 7.2 percent. Financial commentator William Hummer contended during this period (*Bankers Monthly*, November 15, 1976, p. 2) that "medium-term and long-term yields could stay in their current range or decline a bit further." Several months later, Hummer's forecast seemed to have panned out: he observed (*Bankers Monthly*, July 15, 1977, p. 2) that "as summer arrived, bonds were trading near their highest price levels in 3¼ years…" The inflation expectations embedded in these bond rates were correspondingly placid, being in mid-single-digits (see Levin and Taylor, 2013, p. 222). Therefore, the behavior of longer-term Treasury securities reinforced the consensus that what inflation trouble lay ahead would be considerably less severe than that seen earlier in the decade.

Friedman observed in late 1976 (Instructional Dynamics Economics Cassette Tape 204, December 1976, Part 1): "To stick my neck out, I find it hard to believe that long-term bond yields will not rise this coming year, and yet, as I say, I was wrong on that a year ago and maybe I'm wrong now." Longer-term interest rates were indeed about 80 basis points higher in December 1977 than they were in December 1976—but this increase was concentrated in the

final quarter of the year. In fact, before October 1977, every month of the year had recorded a bond rate lower on average than in the corresponding month in 1976. As he explained in his December 1976 commentary, Friedman's basis for believing that rates would increase had been that the late-1976 values were justified only if the inflation rate in the next several years stayed around 4 to 6 percent, while "monetary growth for the past few years does not justify a rate anything like that low."

Yet even with the late-1977 increases in the bond rate, it is clear that the markets *did* expect inflation far below that actually seen in the late 1970s. The monthly average for the rate on ten-year Treasury bonds did not cross 8 percent until February 1978 and did not pass 9 percent until December 1978. See Figure 1.

The monetary basis for Friedman's predictions

Why did Friedman forecast inflation so differently from (and, as it turned out, better than) others in these years? The answer is that the behavior of M2 growth over this period provided a good guide to future inflation developments, at a time when other approaches fell short. He traced the second round of double-digit inflation, that in 1979–1980, to the second monetary explosion of 1976–1977.

As far as Friedman was concerned, the path of future inflation was provided by the pattern of monetary growth, and by the roughly two-year lag from monetary growth to inflation that he had found to characterize the historical U.S. data. As was discussed in Chapter 5, after being surprised by how restrained monetary growth was over 1975, Friedman had sounded the alarm in 1976 about the fresh surge in the money stock. Late in that year, he was drawing parallels between the high monetary growth in 1976 and the rapid rate of monetary expansion in the early 1970s that had preceded the 1973–1974 outbreak of U.S. inflation (Instructional Dynamics Economics Cassette Tape 190, May 1976, Part 1). When high monetary growth continued, Friedman was prompted to observe at the start of 1977 that there had been "unduly expansive [monetary] policy for the last six months" (*San Francisco Examiner*, January 5, 1977).

The evolution of the second monetary explosion in the 1970s is depicted in Table 1, both for the old definition of M2 used in the 1970s and for the modern M2 definition adopted in the United States in 1980.

Table 1. Annualized percentage quarterly growth rates of M2, 1976–1978								
	Quarter of year							
	Q1		Q2		Q3		Q4	
Year	Old M2	New M2	Old M2	New M2	Old M2	New M2	Old M2	New M2

It was on the basis of this monetary explosion that Friedman made his prediction of a renewed, late-decade surge in U.S. inflation.[82] Friedman's initial predictions in 1976 and 1977 of inflation of 7 to 9 percent in the years ahead were evidently arrived at by from subtracting about 3½ or 4 percent average real growth from the 10.5 to 12 percent rate of monetary growth prevailing since mid-1975. But as, during late 1977 and the first part of 1978, he moved into predictions for 1979, he made a somewhat less mechanical adjustment. He reasoned that the inflation of the 1970s had imparted a slight upward trend into M2 velocity, so that a percentage point or two had to be added to inflation projections that were based on (old) M2 growth (*Newsweek*, August 20, 1979; Charles H. Brunie, interview, July 15, 2013). That factor partly accounted for why, in early 1978, Friedman was offering a 12 percent inflation prediction for mid-1979—even though he was not predicting still-higher monetary growth than that observed so far.

Continuing along this line of argument, Friedman predicted at a briefing to the Oppenheimer and Company financial group in mid-1978 that inflation would likely peak in the fourth quarter of 1979, and that "it would be a miracle if inflation peaked below 10 percent, and 10%−12% or 10%−13% would be more likely" (quoted in *Wall Street Journal*, October 1, 1979).

Friedman was on fairly solid ground predicting an extra couple of points of inflation over that suggested by the patterns of M2 growth. From his participation in the Bach Committee (see

[82] Other judgments on this period that have stressed 1976 as the year in which the resurgence of U.S. inflation originated included Brunner (1980a, p. 26), who contended that the Federal Reserve launched new round of inflation via its actions in 1976, and Romer and Romer (2004, p. 140), who saw monetary policy in the late Burns period as very loose: they argued, on the basis of the behavior of real short-term interest rates, that "at the end of 1976, policy became dramatically more expansionary."

Chapter 5) and his related deliberations with the Federal Reserve, Friedman knew that the traditional, commercial-bank-centered M2 definition was on the way out and would be replaced by a broader M2 series that included thrift institutions' deposit liabilities. Although that new M2 series was not yet published in 1978, its behavior could largely be gleaned from the behavior of what in 1978 was officially called M3 (and was published by the Federal Reserve Board). Friedman would therefore have known, from M3's behavior, that the new M2 concept had consistently been growing a couple of points more per year in 1976 and 1977 than had the old (and, before 1980, still official) M2 series. Until the most recent years, a mean-reverting velocity had been a good approximation with regard to the old M2 aggregate, so monetary growth (minus output growth) and inflation behaved similarly, on average: see Chapter 2 above, as well as Friedman's observations in *Newsweek*, April 24, 1978. It could be conjectured that the new M2 series would inherit this historical property of a roughly stable velocity.[83] That being the case, it followed that old M2 velocity had acquired an upward trend of 2 percentage points or so.[84] Consequently, a reduced-form approach of the kind Friedman used, based on past monetary growth and a simple velocity assumption, Friedman had been able to forecast successfully the United States' second bout of double-digit inflation in 1979–1980.

Cost-push views in officialdom

"What's needed is not the knowledge; it's the will."[85] With this statement in February 1978, Friedman displayed his tendency, already mentioned in this chapter, to view policymakers as sharing his own, monetary, perspective on inflation's causes. Starting from this premise of a common economic model with policymakers, he attributed the monetary authorities' generation of inflation, and their failure, so far, to stick to plans to disinflate, to a lack of resolve and to acquiescence to outside pressures. However, for the late Burns years of 1976 to 1978, as for the prior six years, the evidence is strong that Friedman was incorrect: lack of knowledge was a problem, after all. In particular, Burns continued to adhere to a nonmonetary view of inflation and, insofar as he thought that monetary policy mattered for inflation, he mistakenly believed that the Federal Open Market Committee (FOMC) was providing *anti*-inflationary pressure.

---

[83] It was subsequently shown to possess this property (specifically, stationary behavior) by Engle and Granger (1987), Small and Porter (1989), Rasche (1990), and Hallman, Porter, and Small (1991).
[84] This upward trend could be interpreted as a shift by households away from holding bank deposits in the wake of the higher inflation of the 1970s. The fact that new M2 velocity was stationary could then be interpreted as reflecting the fact that the flight away from bank deposits was in large part toward thrift accounts, as well as to the money-fund accounts (included in the modern M2).
[85] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," February 6, 1978, p. 24 of transcript.

An indication that these were Burns' positions is provided by the transcript of the June 1977 FOMC meeting, which includes an exchange between Burns and the president of the Federal Reserve Bank of Boston, Frank Morris. The subject of the exchange was the long-term bond rates. As discussed above, bond rates were quite low. By way of explanation for this state of affairs, Morris remarked: "I think there is an expectation that we are not going to have a sharply rising trend in interest rates. That also shows up in the Treasury bill futures markets. The Treasury bill futures yields are going down, reflecting an anticipation of that." Chairman Burns asked Morris: "You think this behavior of long-term interest rates reflects, in part, confidence in the Federal Reserve's policies?" Morris replied: "I think so, yes." "Well, that's been my own judgment, but it's a hard thing to be sure of," Burns concluded.[86] Although Burns was cautious in his interpretation of what was driving bond rates, he clearly believed that it was appropriate to be confident that FOMC policy was noninflationary.

Potential problems on the inflation front, as Burns saw it, arose from elements other than in the monetary sphere. In fact, although Burns was at odds publicly with the Carter administration over much of 1977, an emphasis on cost-push factors was common ground between himself and the Carter administration team. Meltzer (2009b, p. 919) suggested the contrary, by juxtaposing the views of Carter's advisers against Burns' statement (on July 29, 1977) that inflation cannot go on without "monetary nourishment."[87] Burns' full remark, however, was: "For our part, we at the Federal Reserve know that inflation ultimately cannot proceed without monetary nourishment." This was an acknowledgment that monetary restraint was necessary for long-run price stability, but it did not imply that such restraint was sufficient for obtaining this condition, and it was consistent with nonmonetary factors impeding the achievement of price stability.[88] Furthermore, the statement was predicated on the—in retrospect, badly-informed—notion that monetary policy was already, in 1977, contributing to the reduction of inflation.

In line with his cost-push perspective, Burns regarded the revival of inflation in 1977 as occurring despite a continuing considerable amount of the slack in the economy (see Nelson,

---

[86] From the FOMC meeting of June 21, 1977 (Federal Open Market Committee, 1977a, pp. 17−18).
[87] Meltzer cited this statement as being from the "Carter papers, Jimmy Carter Library." Actually, there is nothing unique to the Jimmy Carter Library when it comes to the availability of this statement. It was from Burns' opening testimony at a Congressional hearing and was printed in the *Federal Reserve Bulletin* at the time. For this published version of the passage in question, see Burns (1977a, p. 728).
[88] More specifically, if cost-push factors had a positive mean in the long run, as adherents to cost-push views of inflation maintained, monetary growth rates that would otherwise be consistent with price stability would be associated with continuing inflation.

2005, and DiCecio and Nelson, 2013, pp. 406, 411).[89] Impressed by the speed of the national economic expansion in the late-1976/early-1977 period, Burns had opposed Carter's tax-rebate idea (*Los Angeles Times*, February 4, 1977; *Daily News* (New York), March 23, 1977). But, as noted, he had signed up to a 6 percent real growth for 1977, and he had endorsed the administration's proposal to bring the unemployment rate down from by about 1.5 percentage points from the end of 1976 to the end of 1977. Viewed in this light and in conjunction with Burns' other statements, the concern that Burns voiced during 1977 about stimulus boosting the inflation rate indicated a speed-limit view of inflation dynamics—and did not signify agreement with Friedman's judgment that the United States was poised to cross into excess demand territory (see DiCecio and Nelson, 2013, pp. 410–412).

Phillips-curve approaches

It was noted in Section I that, by the late 1970s, the Friedman-Phelps work on the Phillips curve had been accepted by many economists. These economists eschewed pure cost-push views of price behavior and instead saw inflation in terms of an expectational Phillips curve relationship, with a sizable response of inflation to the output gap. Those economists who did model inflation using such a Phillips curve were capturing in their projections and policy analysis the aggregate-demand-to-inflation connection that Friedman was using in the reduced-form, monetary-growth-based, inflation forecasts he gave during 1977 and 1978. In principle, therefore, they could, like him, have predicted the double-digit inflation of the end of the decade. In practice, this did not happen.

A key reason for this, discussed further below, is that, in the late 1970s, output-gap estimates continued to be heavily mismeasured—rendering unreliable inflation projections that were based on the output gap. Whereas a cost-push approach would be in error by giving a zero weight to the output gap when a sizable weight was warranted, a Phillips-curve approach might appropriately give a sizable weight to the output gap; but, in the late 1970s, such an approach might use an output-gap estimate that suggested a deeply-negative gap, when it was actually

---

[89] In addition, like Friedman, Burns approvingly quoted U.K. Prime Minister Callaghan's criticism of past inflationary policies. He did so, for example, at an FOMC meeting held a couple of weeks after Friedman quoted in his column (see Federal Open Market Committee, 1976, p. 40). The context in which Burns recited this quotation suggested that he felt that monetary policy was exercising restraint and that the fault in current stabilization policy lay in the danger was that fiscal policy would become overstimulative. Similarly, Burns (1977c, p. 4) portrayed Callaghan's statement as an indictment of past approaches—"policies for stimulating employment on which we have relied in the past"—from which he distinguished the modern-day formulation monetary policy in the United States and elsewhere.

close to zero or even positive. That this was not merely a hypothetical problem in the late 1970s is indicated by Orphanides' (2003, p. 645) Figure 2, in which an official output-gap estimate of the time is always negative in 1977 and 1978, while the revised "final" output gap is nearly always positive in those years.

But in principle, as stressed in earlier chapters, take-offs in inflation such as that observed in 1977 could have led modelers to revise their output-gap estimates promptly and get their inflation projections back on track. However, this process did not occur. The flawed output-gap estimates were, in 1977 and 1978, largely retained. The rise in inflation was, for the moment, primarily attributed to temporary factors; and the chance to project accurately the double-digit inflation of 1979 was missed.

Indeed, even Rudiger Dornbusch who—as described in Section I of this chapter—had done much, with Stanley Fischer, to integrate monetarist ideas about economic behavior into mainstream economics teaching, was inclined to view the output gap as sizable, and monetary ease as appropriate in 1977 and 1978. In the Congressional testimony of March 7, 1978, that was discussed in Chapter 1, Dornbusch stated: "The first priority then should be continued expansion in aggregate demand."[90] To this end, he called for reductions in interest rates: "Interest rates should *not* be allowed to rise further and, indeed, a rollback is desirable."[91] Dornbusch saw the stimulus he recommended, along with other measures he was urging, as consistent with keeping inflation at 6 percent.[92]

Dornbusch and others—including presumably the bond traders who set their years-ahead inflation projections so low during 1977 and into 1978—may have been misled into thinking that inflation in 1977 was overstated by the cold winter weather of early 1977 and by the year's exchange-rate decline, rather than perceiving that the rise in inflation was overwhelmingly due to overly-easy monetary policy.

A fundamental reassessment among policymakers, commentators, and market participants of output-gap estimates and inflation expectations would not occur until 1979. With this reassessment would occur a rethinking of whether monetary policy was, as Friedman had

insisted, been much too loose in 1976–1978. Dornbusch himself was in the vanguard of this rethinking. An early glimpse into his revised thinking came in the fact that, in contrast to Dornbusch's 1978 assessment that interest rates had risen too much already, Dornbusch and Fischer (1979, p. 5) would observe that, during the economic recovery that had started in 1975, interest rates had taken a long time, by historical standards, to pick up. Later, Dornbusch (1993, p. 332), in looking at the double-digit inflation of 1979, observed, "Arthur Burns… was responsible for that situation." In so doing, Dornbusch lined himself up with the Friedman interpretation that the double-digit inflation in 1979 originated in overly-loose monetary policy in the late Burns years.[93]

It is not clear that Phillips-curve-based forecasts, even when using revised data, would have done quite as well as Friedman did in predicting the double-digit inflation of 1979. For example, Stock and Watson's (1999, p. 323) Figure 4 suggested that such projections implied that inflation would be well below 10 percent in 1979 and into 1980. This miss perhaps reflects intractable problems with measuring the output gap or the unemployment-rate gap and in pinning down those gaps' dynamic relationship with inflation. Certainly, however, Phillips curves using the revised gap series would have accurately predicted a sharp rise in inflation.[94] Once again, therefore, the theme emerges of major problems with measuring the output gap—and how Friedman was able to insulate his predictions from these problems.

Output-gap estimates and official views

By 1977, there was considerable realization that the output gap had been overestimated *in the past*. In the case of the United Kingdom, for example, Laidler (1976c, p. 87) observed that "the use of macroeconomic policies to maintain levels of employment too high to be viable in the long run has been an important source of inflationary pressure." What was less appreciated, in both the United Kingdom and the United States, was that such overestimation *remained* a major practical problem in the late 1970s.

Instead, as of 1977, it seemed that the authorities had now put their house in order and

---

[93] A drastic reassessment of the appropriate posture of monetary policy in the late 1970s would also be evident in Dornbusch's analysis of the United Kingdom. Whereas Dornbusch and Fischer (1980a, p. 25) estimated that the U.K. output gap was −9.6 percent in 1977, Dornbusch would later assess that the U.K. output gap was zero in that year (*Financial Times* (London), July 24, 1985).
[94] Reflecting this, the simplest accelerationist Phillips curves do well in explaining U.S. inflation's behavior during the 1970s (see the references discussed in Chapter 4).

appropriately revised their estimates of potential output. The Carter Administration's ambitious economic growth target for 1977, and the perception of a large amount of slack that motivated the target, might have been even stronger, had not estimates of potential output not been substantially revised down. Downward adjustments to estimates of potential GNP had led the Council of Economic Advisers in January 1977 to issue revised estimates of the output gap in recent years, with the result that the output gap during the trough in 1975 was reduced (that is, made less negative) by about 4 percentage points (Orphanides, 2003, p. 655). Likewise, the Federal Reserve Board in early 1977 substantially lowered the estimate of potential production that underlay its estimates of capacity utilization (*Financial Times* (London), January 14, 1977). It turned out, however, that the scale of the change in the aggregate-supply picture that had occurred in recent years was so great that, even with these revisions, the economy's sustainable-output path remained substantially overestimated.

A crucial problem here was that, as yet unbeknownst to policymakers, from 1973 onward the potential growth rate of the economy had dropped from close to 4 percent to about 2.5 percent. In contrast, policymakers in 1977 continued to work on the assumption of trend growth close to its pre-1973 rate: Arthur Burns, for example, during 1977 gave potential output growth as 3.5 percent (Burns, 1977b, p. 361). The belated recognition of this productivity-growth slowdown is considered further in Chapters 8 and 9.

The difficulties in estimating the output gap arising from the changing potential-growth picture were compounded by large revisions to actual output data.[95] Another factor that continued to cloud the picture of the true output gap was, of course, the rise during the 1970s in the natural rate of unemployment. This matter is discussed further in the discussion titled "Franco Modigliani" in Section III below.

The combination of inaccurate initial output data and inadequately-revised potential-output estimates meant that output-gap mismeasurement continued to be a serious problem in 1977. Though at the time perceived as being about 7 percent (Orphanides, 2003, p. 645), modern estimates of the output gap in 1977:Q1, Carter's first quarter in office, suggest that output was less than 2 percent below potential by that point. Furthermore, the gap was narrowing rapidly, and it was positive in each quarter from 1978:Q2 through the end of the decade.

---

[95] See Orphanides (2003), as well as the discussion in Chapter 4 above of the revisions to the decline in output during the 1973–1975 recession.

In marked contrast to these subsequent assessments, James Tobin, in his April 1977 television debate with Friedman, had declared that the United States had inflation "not because there's too much money chasing too few goods. Quite the contrary. We have excess capacity, and a large amount of unemployment."[96] Similarly, in officialdom, Carter's Chairman of the Council of Economic Advisers, Charles Schultze, remarked in September 1977: "Ample resources are available to permit further expansion…" (*Daily News* (New York), September 14, 1977.) In the same month, the Federal Reserve Board's Governor Charles Partee testified that "sizable unused resources exist in this and other economies" (Partee, 1977, p. 891; also quoted in *American Banker*, October 3, 1977, p. 15).

As stressed in Chapter 5, Friedman was not ahead of the pack in recognizing the shift in the behavior of potential output. In 1978, for example, his estimate of noninflationary monetary growth seemed to be predicated on potential growth of about 4 percent (*Newsweek*, April 24, 1978). Only in 1979 did he seem to embrace a potential growth rate of about 3 percent (*American Banker*, June 12, 1979, p. 3)—by which time the Carter Administration had brought down its official estimates of potential growth to such a rate. Nor did Friedman and others on his side of the debate on stabilization policy show much sign of detecting how badly the output statistics themselves had been underestimated: Lucas and Sargent (1978, p. 49), for example, referred to the United States as having had a "depression" in 1973−1975. Friedman, as we have seen in Chapter 5, did sound warnings early on about the rise in the full-employment unemployment rate. But this was only one reason for exaggerated gap estimates in the 1970s.[97]

The monetarist side nonetheless became well known for eschewing output-gap estimates in their policy prescriptions and macroeconomic analysis (see Wonnacott and Wonnacott, 1979, pp. 331−334, for an early discussion). This characterization was justified, on two dimensions.[98]

First and most obviously, they stressed policies, notably the constant monetary-growth-rule, that did not respond to estimates of the level of the output or unemployment gaps.

The second respect in which monetarists in the late 1970s distanced themselves from output-gap estimates was that their view of the inflation process suggested a picture of the excess-demand

[96] *MacNeil-Lehrer Report*, PBS, April 18, 1977 (*American Banker*, April 21, 1977, p. 6).
[97] The best sign Friedman gave during this period of a recognition of a secular productivity-growth slowdown was to point to the robust growth of employment since 1975 as an indication that the U.S. economy had had a good recovery from the 1973−1975 recession, (*Oakland Tribune* (California), January 27, 1977).
[98] In addition to what follows, see the discussion in Nelson (2020a, Chapter 8).

situation that was at variance with the extant output gap estimates. This was a point on which some members of the monetarist school were explicit during 1977 and 1978. The economic analysts at Citibank, for example, noted that official estimates of slack could not produce inflation rates of the kind observed in recent years and concluded (*Citibank Monthly Economic Letter*, October 1977, p. 4): "This indicates that either there is less slack in the economy than the conventional indexes would have us believe[,] or that the existence of slack has less of a damping influence on the inflation rate than it used to." The monetarist position was squarely in line with the first of these interpretations, with David Laidler (1978b) challenging a prominent report to the OECD by McCracken and others (1977), which had reported mid-1970s troughs of the output gap as being in double-digit percentages for the United States and other major countries. Laidler pointed out that the inflation of the 1970s suggested a condition of excessive demand—not the chronic excess supply that had been the report's characterization of the decade. For his part, Friedman's emphasis on excess demand had been implicit in his predictions from late 1976 of a sharp rise in inflation over the rest of the decade.

Friedman, therefore, by no means denied the output gap/inflation link in his own analysis. On the contrary, the reduced-form monetary-growth/inflation link in his framework arose as an outgrowth of the structural dependence of inflation on excess demand. Consequently, as indicated above, Friedman's prediction that rapid monetary growth would be followed by inflation embedded the notion that, along the way to producing inflation, monetary ease would generate positive output gaps. But his lack of confidence in estimates of these structural relationships, and in empirical measures of resource gaps, led him to the shortcut of direct monetary-growth/inflation relationships. This reduced-form approach served him especially well during the late 1970s.

Other reduced-form forecasts

We have seen, therefore, that Friedman's inflation predictions did well because they captured the relationship between aggregate demand pressure and inflation without using unreliable estimates of slack to predict inflation. Could econometric models have done as well as he did, if they had forecast using available macroeconomic data and not used gap estimates? It is difficult to know the answer to this question definitively, as this was a time when other reduced-form approaches to forecasting inflation were hard to come by. Autoregressive integrated moving average (ARIMA), or Box-Jenkins, time-series forecasting methods were available and had become widely used but, by construction, these approaches projected inflation based on its own past

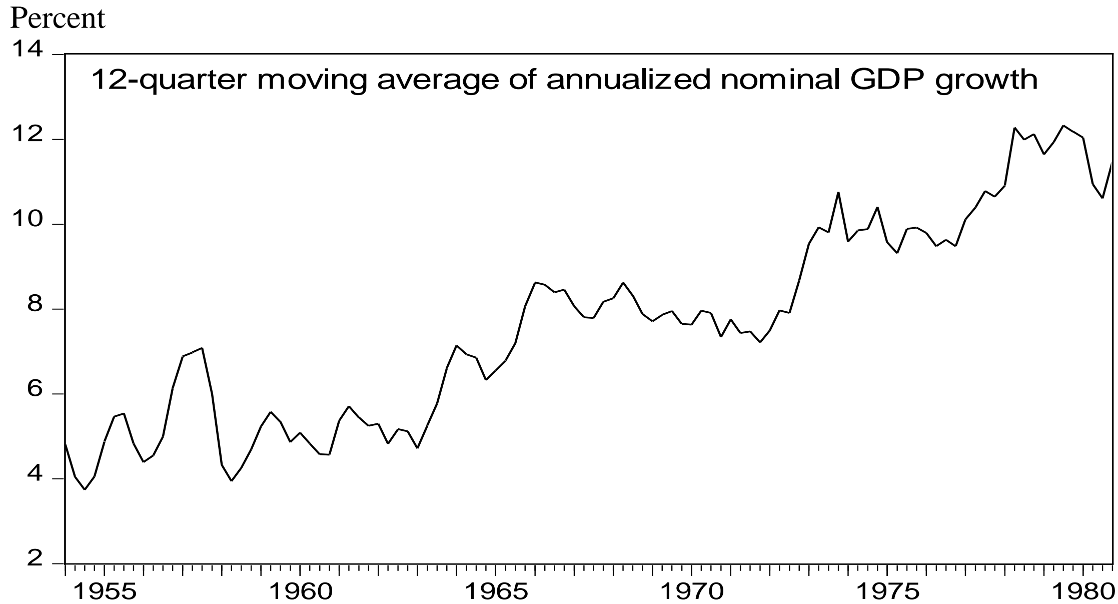

Figure 2. Twelve-quarter moving average of annualized growth in nominal GDP.
Source: Computed from quarterly data, Federal Reserve Bank of St. Louis' FRED portal.

behavior—and so they supported the notion that the moderate inflation pattern of 1976 would continue. The vector autoregression (VAR) approach to forecasting was just getting started: Sims' (1980) pioneering article on the subject appeared in working-paper form in 1977 (see Sargent, 1979) and applications of the VAR approach were only beginning to appear in print in 1977–1978—for example, Sargent (1978).

One reduced-form approach that likely would have done about as well as Friedman's forecasts of inflation using monetary growth was not prevalent at the time. This would be to predict inflation using nominal income growth. Friedman took for granted that rapid nominal income growth would occur in the course of monetary ease being transmitted into inflation—and that, with the different lags involved in the reaction of output growth and inflation to monetary policy, nominal income growth would most likely take off ahead of inflation. This regularity certainly was observed again in the late 1970s. Jerry Jordan noted in 1978 (*American Banker*, October 23, 1978*b*) that nominal income growth in the prior three years had averaged over 11 percent, "the highest rate for any three-year period in over 30 years." This pattern is confirmed by modern data on nominal GDP growth. A three-year average of annualized quarterly nominal income growth (see Figure 2) shows that, in the late 1970s, aggregate demand growth reached a new plateau that was steeply higher even than the previous high of the mid-1970s. The three-year

averaging process also shows also how ephemeral the restrictive policies that led to the 1973–1975 recession proved to be.

Therefore, the pattern of nominal income growth, like that of M2 growth, provided an early warning of the late 1970s resurgence of inflation. Because nominal income growth typically lagged monetary growth over this period, however, monetary growth, and increases in M2 in particular, provided a signal about the rise in inflation that was ahead of the signal provided by nominal income growth.

In light of episodes like the late 1970s, Gordon (1985, p. 49) offered the generalization: "Inflation in the long run is always and everywhere an adjusted-nominal-GNP phenomenon."[99] Friedman would largely endorse this notion, himself remarking in 1985, "Inflation tends to depend on the average rate of growth of nominal income… over a considerable period."[100] However, Friedman regarded tracing inflation to monetary growth as a more fundamental exercise. Furthermore, nominal GDP growth can be very high and not lead to inflation, as occurred in 1983–1984. In this later period, rapid nominal GDP growth was noninflationary because the economy was absorbing considerable resource slack. That is, the mid-1980s featured a state of the economy that many nonmonetarist economists, largely erroneously, had perceived as prevailing during 1977–1978: rapid growth in aggregate spending that was noninflationary, as it was justified by the amount of slack in the economy.

Monetary targets and the federal funds rate

The failure of the Federal Reserve to meet its monetary targets, particularly by the criterion of M2, was what for Friedman lay behind the monetary explosion that had generated faster growth in nominal spending and the revival of inflation in the United States.

In late 1976, Friedman lamented the fact that the Federal Reserve's announced intention of a gradual slowdown in monetary growth had not been manifested in its actual performance (Instructional Dynamics Economics Cassette Tape 204, December 1976, Part 1). A little later (in (Instructional Dynamics Economics Cassette Tape 208, February 1977, Part 1), after noting that Burns had adjusted down the target range, Friedman vented: "But all he's changing are the

[99] Gordon defined "adjusted nominal GNP" as nominal GNP growth minus the long-run rate of potential output growth.
[100] Friedman (1985a, p. 52).

targets—not what's actually *happening*!" Similarly, Friedman observed late in 1977 that "while the targets are going down, actual monetary growth is going up" (*St. Louis Globe-Democrat*, December 7, 1977). He summed matters up in September 1978 with the observation that the "targets for monetary growth set by the Fed have consistently declined in the past two years in order, the Fed says, to foster a gradual reduction in inflation, but actual monetary growth has proceeded along a rising, not a declining[,] trend."[101]

These characterizations were borne out by the fact that the Federal Reserve's M2 target range had stepped down from 8½–10½ percent growth in 1975 to 7½–10½ percent in 1976, but the outcomes over the target periods were 9.6 percent and 10.9 percent, respectively (Argy, Brennan, and Stevens, 1990, p. 54).[102] Monetary growth was then 9.8 percent in 1977.[103] Furthermore, the pattern for M3—which as suggested above, Friedman by this stage likely considered a more meaningful monetary aggregate, as it signaled the behavior of the in-progress redefined M2 series—was considerably worse: the Federal Reserve overshot its targets in 1975, 1976 and 1977, and monetary growth was above 11.5 percent in every year (Argy, Brennan, and Stevens, 1990, p. 54; Bernanke and Mishkin, 1992, p. 190).[104] Monetary growth on the M2 measure did, however, decline substantially in 1978 (see Table 1 above and the discussion titled "G. William Miller" in the next section).

Friedman also expressed exasperation at Burns' statement that monetary growth had not been excessive in 1976 (Instructional Dynamics Economics Cassette Tape 208, February 1977, Part 1). The FOMC did raise the federal funds rate in 1977, by about 200 basis points in total: it averaged 4.65 percent in December 1976, 6.56 percent in December 1977. Furthermore, testifying in mid-year about the rising funds-rate profile, Burns attributed the increase to FOMC moves to restrain monetary growth. But the Chairman also pointed to the stability of long-term bond rates as implying that the FOMC tightening had been sufficient (Burns, 1977a, p. 724).

---

[101] Friedman (1978c, p. R−182). In this assessment, "the past two years" may have been a reference to 1976 and 1977.
[102] Bernanke and Mishkin (1992, Table 1, p. 190) recorded a similar rise. The data for old M2 in Simpson (1980, Table A2, p. 113) show a sharper move up, from 8.4 percent in 1975 to 10.9 percent in 1976.
[103] See Argy, Brennan, and Stevens (1990, p. 54) and Simpson (1980, Table A2, p. 113). (In Bernanke and Mishkin, 1992, p. 190, the reported M2 growth for 1977 had an evident typographical error, with 9.8 percent being incorrectly reported as 3.8 percent.)
[104] The pattern for M1 behavior differed from that of the broader aggregates. But, from mid-1976, M1, too, was largely characterized by growth in excess of the FOMC targets (Paulus, 1980, pp. 103−104). Indeed, during 1977, when M2 growth was high but formally within the Federal Reserve's generous target range, M1 growth was in excess of its own target band (*American Banker*, October 3, 1977, p. 3).

Indeed, the fact that long-term rates were quite low likely reflected not only unrealistically optimistic inflation expectations on the part of markets, but also downward pressure on real interest rates from still-easy monetary policy. In 1975, Burns had implied that monetary policy had a negligible effect on (real and nominal) long-term rates in the short run. By February 1977, he was willing to concede that long-term rates responded to movements in the federal funds rate "to a degree" (*American Banker*, February 10, 1977), but even in the FOMC meeting the following month, Burns insisted "there's only one interest rate over which we have a high degree of influence, and that is the federal funds rate."[105] A different outlook on the Federal Reserve's short-run influence on interest rates might have led Burns to view low long-term rates in mid-1977 as a symptom of monetary policy being too loose.

The failure of the monetary-growth targets to be met, together with the Federal Reserve's continuation of an operating procedure centered on setting the federal funds rate, led Friedman to conclude in September 1978 that "the major effect of monetarism has been on the language in which policy is expressed rather than on the content."[106] He would have been reinforced in this view by the observation of the aforementioned Federal Reserve Bank of Boston's president, Frank Morris, a couple of months earlier (*Wall Street Journal*, July 17, 1978, p. 1): "Most of us have learned a great deal from Friedman and the monetarists, but few of us accept the entire body of monetarist doctrine. I believe that monetarism may have peaked and that it now may be on the wane."

Monetary targeting and the law

Notwithstanding his dissatisfaction with Federal Reserve policy over this period, Friedman could at least point to some further legislative successes for his own approach to monetary policy. The requirement that the Federal Reserve state and pursue monetary growth targets, already initiated by Congress in 1975, was put on a more formal footing with the passage of an amendment to the Federal Reserve Act, signed by President Carter in November 1977.[107] Friedman later noted that this legislative move had, in essence, made a monetary-growth rule part of United States law.[108]

---

[105] From Burns' remarks at the FOMC meeting of March 15, 1977 (Federal Open Market Committee, 1977b, p. 31).
[106] Friedman (1978b, p. R–185).
[107] The legislation, as signed and passed, is available at *https://fraser.stlouisfed.org/title/1040*. In the legislation's text, the amendments to the Federal Reserve Act it contained were separately and officially termed the Federal Reserve Reform Act, and that terminology would later be used by Federal Reserve Chairs (see, for example, Miller, 1978b, p. 185 [p. 1 of typescript version]; Bernanke, 2013, p. 7).
[108] See Friedman (1995, p. 175). Friedman also briefly referred to this 1977 legislation in Friedman (1982a, p. 107) and Friedman and Friedman (1985, p. 162).

As Friedman acknowledged, however, the new statute essentially repeated the wording of Congress' 1975 reporting requirements for the Federal Reserve's monetary targets.[109] It followed that the 1977 legislation amounted to a continuation of arrangements that Friedman had already concluded had not led to a material change in the substance of U.S. monetary policy. Indeed, Burns himself had remarked in an interview: "Our objective in life is not to hit the target, but [to secure] the best possible performance of the economy." (*New York Times*, January 4, 1976.)

Friedman wanted something more binding. Influenced by the analysis of a former student, Robert Weintraub, who worked as a staffer for the Congressional supervisors of the Federal Reserve, Friedman became persuaded that nothing short of a constitutional amendment imposing a monetary rule was needed to make the rule stick.[110] This idea was in harmony with Friedman's strong, if notably uncritical, interest in the public-choice literature. The idea led to the Friedmans' drastic, and hardly practical, proposal in 1980 (in the book version of *Free To Choose*) of a constitutional amendment that would consecrate a constant-monetary-growth rule for the United States—one that would apply, initially at least, to the monetary base.[111]

Other Congressional initiatives

Another legislative change in the 1977−1978 period that had a bearing on the Federal Reserve's targets was the Full Employment and Balanced Growth of 1978, also known as the Humphrey-Hawkins Act, which became U.S. law in late October 1978.[112] The Humphrey-Hawkins legislation further formalized the reporting process regarding the Federal Reserve's targeting of monetary aggregates. And it made the announced target ranges pertain to the whole year—rather than being routinely readjustable at every FOMC meeting.[113]

Other aspects of the legislation also had implications for monetary policy. But exactly what these implications were was a matter of differing interpretation, both at the time and

---

[109] This included the resolution's expression of a dual mandate of maximum employment and price stability for the Federal Reserve. See Clarida (2021).

[110] See Friedman's (1995, p. 175) discussion, which cited Weintraub (1978) in support. See also Chapter 5 above.

[111] See Friedman and Friedman (1980, p. 308) as well as Friedman and Friedman (1985, p. 99). (On Friedman's growing interest in monetary-base-oriented rules during the 1980s, see Chapter 10 below.) Friedman (1985a, p. 61) himself acknowledged that a constitutional amendment to impose constant monetary growth was "highly unlikely."

[112] The bill was passed in its final form by Congress on October 15, 1978, and approved by President Carter on October 27, 1978 (see *https://fraser.stlouisfed.org/title/1034* and *https://www.presidency.ucsb.edu/documents/acts-approved-the-president-week-ending-friday-96*). DeLong (1997, p. 271) gave a date of 1977 as when the act was passed and signed. This date was not correct.

[113] See Chapter 4 above, as well as Paulus (1980, p. 103) and G. William Miller's testimony of February 21, 1979, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1979a, p. 8).

subsequently. The Humphrey-Hawkins Act called for the federal government to pursue full employment. In itself, this was not a new statutory requirement for either the federal government generally or the Federal Reserve specifically. The latter institution already had an assigned goal of maximum employment alongside a price-stability goal.[114] The act, as passed, was merely a statement of goals (and, in view of existing legislation on the books, really just a reaffirmation of goals).[115] It did so with some numerical specificity, however, calling for a 4 percent unemployment rate to be achieved by the 1980s (as well as inflation below 3 percent).[116] In view of this, some observers, both then and later, saw the Humphrey-Hawkins Act as setting employment goals inconsistent with price stability. DeLong (1997, p. 271), for example, viewed the Act as symptomatic of the policies that produced the 1970s inflation outcomes and as helping to encourage those outcomes (a characterization somewhat difficult to square with the fact that, as discussed in the next section and in Chapter 9, monetary policy *tightened* in both 1978 and 1979).

Closer to the time of the law's passing, Blinder (1983, p. 70) had reached a similar conclusion to DeLong. Blinder judged that the "Humphrey-Hawkins type definition of high employment" involved an unemployment goal far below the natural rate and so would be inflationary if used as the basis for monetary and fiscal policy settings. Later, however (and when he was himself a policymaker), Blinder (1994, p. 336), in essence, withdrew this criticism. He instead cast U.S. law as specifying an economic-stabilization goal for the Federal Reserve—but one that did not oblige the authorities to set a target for unemployment that was below the natural or full-employment rate of unemployment.

In the event, the Federal Reserve's own posture over the years from 1977−1978 onward was similar to that of Blinder (1994). The interpretation on which FOMC policymakers put the Humphrey-Hawkins and the other laws giving it an employment mandate was that they set an unemployment-rate goal but one that should evolve as policymakers' estimates of the natural rate

[114] It did so through the aforementioned amendment to the Federal Reserve Act in 1977: see, for example, Bernanke (2006b). (However, the implication in the same Bernanke speech that the Federal Reserve did not have a legislated price-stability goal *until* 1977 is at variance with how many pre-1977 policymakers, as well as numerous commentators including Friedman, interpreted existing statutory goals. For a discussion, see Nelson, 2020b, Chapter 12.)
[115] DeLong (1997, p. 271) incorrectly took the act as introducing a dual mandate of price stability and full employment for the first time.
[116] See *https://fraser.stlouisfed.org/title/1034* and *Newsweek*, March 5, 1979.

improved.[117] In addition, both in the years leading up to the act and after its passing, the Federal Reserve leadership was vocal on the point that the full-employment unemployment rate was higher than it had been in the past.[118] In so doing, they indicated, sometimes explicitly, that nonmonetary policies should be responsible for lowering that rate and that it was not appropriate for monetary policy to try to attain below-normal unemployment rates.

For his part, Friedman had vehemently opposed early versions of the Humphrey-Hawkins bill. These drafts had actually required the federal government to engage in large-scale public-sector hiring, in the event of the unemployment rate reaching values perceived as excessive, in order to attain the bill's specified unemployment target. Friedman had spoken out strongly against this measure in his *Newsweek* columns—both in 1974, when it was being mooted in Congress, and in 1976, when it was specifically associated with the Humphrey-Hawkins bill (*Newsweek*, September 2, 1974; *Newsweek*, August 2, 1976).

Friedman's *Newsweek* analyses considered two cases. In the first case, the extra public expenditure involved in the new federal hiring would not be monetized by the Federal Reserve. In such an instance, the hiring "would not reduce unemployment but simply add to government employment," a circumstance that would make "us all poorer" because the public employment would direct resources less efficiently than the market system (*Newsweek*, August 2, 1976). Contentions that public hiring added to overall output and employment, Friedman suggested in his 1974 column, were based on a "neglect of indirect effects" (*Newsweek*, September 2, 1974). His 1976 column had zeroed in on the "folly" in the economic analysis guiding Senator Hubert

---

[117] The other laws included the Employment Act of 1946 and the aforementioned Federal Reform Act of 1977, both of which specified a "maximum employment" objective. On the fact that the maximum-employment remit has been interpreted by officialdom as referring to a long-run sustainable employment concept, see, for example, Judd and Rudebusch (1999) as well as Blinder (1997, p. 4). On this matter, Blinder added that "the FOMC has never officially adopted the natural rate Phillips curve as part of its intellectual framework." This situation in effect changed in 2012. However, even in a framework not based on the natural rate hypothesis, policymakers may regard it as desirable, on price-stability and other grounds, to avoid economic overheating and may interpret maximum-employment goal as something below a physical maximum. These positions were in fact those that prevailed in policy circles in the United States throughout most of the postwar period. For example, Karl Bopp, Federal Reserve Bank of Philadelphia, cautioned against "policies of overfull employment and inflation" and saw monetary policy as appropriately directed at promoting "maximum sustainable use of available resources" (Bopp, 1970, pp. 15, 16).

[118] For example, like Friedman and others, both Chairman Burns and his successor cited higher unemployment benefits as a factor pushing up the full-employment unemployment rate. Burns' own way of articulating this point was to observe that "there are always some people who get along very well on unemployment insurance and food stamps" (*Washington Star* (Washington, D.C.), November 25, 1976). (This remark bore out Burns' earlier observation—in *People Weekly*, April 14, 1975, p. 18—that "I am not much of a diplomat." Notwithstanding this, in the 1980s, Burns did become a senior U.S. diplomat.) On Chairman Miller's observation on the benefits/unemployment link, see Miller (1978a) and the discussion in Chapter 4 above.

Humphrey. Humphrey—who, during his spell away from the U.S. Senate in the 1960s, had been on the 1964 and 1968 presidential tickets, and so had been on the opposite side to Friedman in those campaigns—was moved to reply in *Newsweek*'s letters pages to Friedman's 1976 column. In that response (*Newsweek*, October 11, 1976*b*, p. 8), Humphrey cited the existence of economic slack and implied that the slack would not be absorbed unless the public sector grew: "The more than 7 million workers now unemployed attest to the failure of the private economy to absorb these workers." This reply would have grated with Friedman both in its implication that measured unemployment invariably recorded economic slack and that additions to government spending, for an unchanged monetary policy, provided a means of adding to overall economic activity.

The second case considered in Friedman's two *Newsweek* columns was that in which the fiscal expansion associated with public-employment measures was accommodated by Federal Reserve monetary easing. Friedman added that, in this case, new government demand would not be completely at the expense of "private demand[,] and so could create new jobs" (*Newsweek*, September 2, 1974). But he stressed that the end result would be to add to inflation, not to real economic activity.

Although Humphrey's bill contained price-stability as well as employment goals, and in his 1976 reply to Friedman he had affirmed that the "choice is not… between full employment and inflation," it was clear that Humphrey did not share Friedman's perspective on the demand/inflation linkage. Rather, in Humphrey's assessment (*Family Weekly*, July 3, 1977): "In recent years inflation has been the result of OPEC pricing policy, poor harvests, underutilization of machinery and equipment, high interest rates[,] and noncompetitive pricing by big business." Like so many who took a nonmonetary perspective on inflation, Humphrey saw stagflation as a vindication of cost-push views: "we have seen that as unemployment went up so did prices, and as inflation came down [after 1974] so did unemployment" (*Family Weekly*, July 3, 1977).

This clash of viewpoints on the inflation/unemployment relationship had been evident earlier, on October 20, 1975, when Friedman and Humphrey had a face-to-face encounter at a special hearing of the Joint Economic Committee in the city of Chicago. When, during the question-and-answer portion of Friedman's testimony, Humphrey observed that "unemployment produces inflation under the current situation," Friedman replied: "I don't believe that's quite correct."[119]

---

[119] In Joint Economic Committee (1975d, p. 63).

The exchange between Humphrey and Friedman also concerned specifically the Humphrey-Hawkins bill. In the course of the discussion, Friedman stated his objections to the economic-planning and public-employment aspects of the bill. These objections led Humphrey to retort: "You are just as stubborn now as when I first met you. And, by the way, you are very effective."[120]

In the event, the version of the Humphrey-Hawkins bill that went into law—nine months after Humphrey's death—was considerably watered-down and lacked the public-employment provisions that Friedman had criticized. Friedman himself quickly became reconciled to the Humphrey-Hawkins Act, devoting a *Newsweek* column to the subject of "Implementing Humphrey-Hawkins" (*Newsweek*, March 5, 1979). In his 1976 rebuttal, Humphrey had complained: "Nowhere in his article does Professor Friedman even indicate that he supports full employment as a goal." In fact, Friedman had a lengthy record of endorsing full employment as a policy goal (see Nelson, 2008; 2020a, Chapter 8). His objection was instead to activist full-employment *policies*, which he proposed to replace with rules that would promote conditions of full employment without targeting output or the unemployment rate directly.

In his 1979 column, Friedman squared the low numerical unemployment target value in the new law with his own natural-rate framework by treating Humphrey-Hawkins as an injunction to lower the unemployment rate through improvement of the supply side of the economy, alongside adherence to fiscal and monetary rules that "would provide a more stable economic environment" (*Newsweek*, March 5, 1979).[121]

Federal Reserve transcripts

Still another area of monetary policy in which legislators were active in the later 1970s was that of Federal Open Market Committee policy communications.

As of the mid-1970s, the Federal Reserve adhered to the following practice with regard to FOMC meetings: In addition to regularly releasing, after a multi-week interval, minutes of the monthly meetings, it published transcript-like lengthy records (called the Memoranda of

---

[120] In Joint Economic Committee (1975d, p. 63).
[121] The column argued that the policy rules that could implement the law's goals would be put in place or encouraged by a proposed constitutional amendment that Friedman had recently been involved in drafting. On this draft amendment, see Chapter 10 below.

Discussion) of the meetings.[122] During the Burns era, these transcript documents were issued with a roughly five-year lag (so, for example, those for the year 1966 were available by early 1972).[123]

In April 1975, however, Representative Wright Patman—who, the previous January, had been dislodged by Henry Reuss as chair of the House of Representatives' Committee on Banking, Currency, and Housing, but who still possessed oversight powers as chair of its subcommittee on monetary policy—formally requested that Chairman Burns hand over the as-yet-unreleased transcripts for meetings from 1971 to 1974.[124] Burns declined, on the grounds that a multi-year lag in the release of the transcripts was needed to foster a mood of candor and give-and-take in FOMC meetings (see Lindsey, 2003, pp. xii–xvii).

In the face of such Congressional pressure for early release of the transcripts, as well as a separate move being made in the courts to compel expedited release of a variety of FOMC documents (such as the meeting minutes), the FOMC announced in March 1976 that it would stop preparing the Memoranda of Discussion (Lindsey, 2003, p. xi).[125] By making this move, it seemingly signified that it would not keep transcripts or audio recordings for its meetings from mid-1976 onward (*Wall Street Journal*, December 20, 1993; Lindsey, 2003, pp. 8–10).
It was against that background that, in 1976–1977, Stephen Neal, the new chair of the U.S. House of Representatives' subcommittee on monetary policy (Patman had died in March 1976), solicited responses from experts, and held hearings, on the subject of maintaining and making public the FOMC meeting transcripts.[126] Friedman's own contribution was a letter to Neal dated

---

[122] These publications described the meeting's exchanges in the third person. But they provided detailed, chronological accounts of individual participants' contributions to those exchanges. Their transcript-like quality was reflected in Warburton's (1976) characterization of them as "mechanically reported verbatim records."
[123] See Federal Open Market Committee (1971, pp. 90–93).
[124] Patman apparently did not apparently request the 1970 transcripts, whose public release was due within a year.
[125] On the legal actions made against the Federal Reserve at the time, see *Washington Star* (Washington, D.C.), November 25, 1977, Goodfriend (1986, pp. 65–78), and Lindsey (2003, pp. 4–24), as well as the capsule account by Friedman and Schwartz in the *Wall Street Journal* of December 20, 1993.
[126] The published volume to result from these inquiries was *Maintaining and Making Public Minutes of Federal Reserve Meetings*. This was a misleading title, as the FOMC already did continue to maintain minutes (formally titled the Record of Policy Actions and Minutes of Actions) for its meeting, and these documents continued to be regularly released from the mid-1970s onward without interruption. The Neal investigation, like the Patman request, had been concerned with whether transcripts (*a.k.a.* the Memoranda of Discussion), not the minutes, should be maintained (and be released in an expedited manner). Friedman himself, like Burns and many others, referred to the Record of Policy Actions as the meeting minutes notwithstanding his 1976 practice (discussed presently) of referring to the transcripts (strictly speaking, the long, but third-person, description of the meeting) as the minutes. (On Friedman's usage of "minutes," see Nelson 2020b; for Burns' usage of this terminology, see Lindsey, 2003, p. xiii. Burns' successor, G. William Miller, also followed this practice: see his April 1978 testimony quoted below.) The element of validity in calling the transcript-type long policy-meeting descriptions the "minutes" is that the

October 2, 1976. This letter remarked that Neal's questionnaire "touched a very sensitive nerve in my particular case. When Anna Schwartz and I were writing our *Monetary History of the United States* we were denied access to the minutes of the Open Market Committee by the Federal Reserve System at that time."[127] (Here, by "minutes" Friedman meant not the minutes, but instead what were, as noted above, known by the 1970s as the Memoranda of Discussion—that is, the published versions of the meeting transcripts.) Friedman recalled how he and Schwartz, in writing their *History*'s account of monetary policy in the 1930s, had been able to compensate for the absence of these documents for FOMC meetings (as well as the meetings of the predecessor committees to the FOMC) by using former Federal Reserve Bank of New York president George Harrison's publicly-available papers. These papers, deposited with Columbia University, had included internal Federal Reserve documents, including detailed policy-meeting memoranda.

In his letter, Friedman made the point that the start of the Federal Reserve's practice of releasing same-year FOMC minutes had begun in 1967, while its practice of releasing FOMC transcripts after a five-year lag had begun in 1964.[128] Prior to these changes, the minutes for the FOMC meeting in a given year had been released only in the following year's Federal Reserve Board *Annual Report*, while transcripts had had no official release at all. Friedman suggested that the likely catalyst for these mid-1960s increases in FOMC disclosures was the release of the Friedman-Schwartz *Monetary History*. The implication was that the Friedman-Schwartz study provided impetus for enhanced FOMC meeting documentation: both because their work had highlighted the limited amount of releases the Federal Reserve had made to date on FOMC deliberations; and also because the Federal Reserve hoped that issuance of its historical records would prompt other researchers to produce rival studies that disputed the *Monetary History*'s mostly-negative verdict on the Federal Reserve's historical monetary policy performance.[129]

Other accounts have pointed to different reasons why the FOMC started to release these

---

Federal Reserve's name for the Memoranda of Discussion before 1967 was the "Minutes" (see Danker and Luecke, 2005, p. 176, and *https://www.federalreserve.gov/monetarypolicy/fomc_historical.htm*).

[127] Friedman (1976g, p. 201). See also *Wall Street Journal*, December 20, 1993, and Friedman and Friedman (1998, pp. 233–235).

[128] To be more specific: In late August 1964, the Federal Reserve Board announced that a duplicate of the FOMC meeting transcript-minutes for the years from 1936 to 1960 would be deposited at the National Archives and made available there. See Yohe (1965, p. 352). In practice, copies became available in various other publicly accessible locations too.

[129] See also *Wall Street Journal*, December 20, 1993.

documents in the 1960s.[130] Whatever the reasons, however, it remains the case that Chairman Burns was being accurate when he remarked in his 1975 response to Patman that, as things stood, the FOMC regularly issued a "copious body of information" concerning its decisions, separate from that in the transcripts.[131]

True, the Federal Reserve had, by 1975, acquired a reputation for obfuscation that was now hard for it to shake. For example, *Business Week* (April 28, 1975) had editorialized that the "Fed itself is sticking to the traditional policy of saying little, and what it says comes out in circumlocutions that require translation and interpretation." But, in fact, the FOMC minutes were not vacuous. They contained material information about the FOMC's thinking, and the Federal Reserve Board staff of the time prided themselves on keeping accurate records of the meeting.[132] Furthermore, these releases could be taken in conjunction with the large number of speeches by Burns and other FOMC policymakers, the Congressional testimony of Burns and other Board members, as well as other material in the *Federal Reserve Bulletin* and in the Board's annual reports. The sum of these items provided contained ample material for ascertaining policymakers' doctrine and strategy and the motivation for FOMC decisions during the 1970s—and they were used for this purpose by researchers such as Poole (1979) and Romer and Romer (1989, 2002).

From the mid-1970s onward, Friedman was heavily influenced by the public-choice literature (see Nelson, 2020a, Chapter 8, as well as the next chapter). This perspective made him extremely disdainful from about 1975 on when it came to much of the Federal Reserve's public descriptions of its policies. With regard to strategy and doctrine, Friedman would, as already indicated, contend that the monetary policymakers understood the monetary nature of inflation. Correspondingly, he implied that their public appeals to cost-push explanations amounted simply to disinformation.[133]

But it seems that, instead, Friedman was under a mistaken impression when he supposed in the later 1970s that Burns and other policymakers no longer subscribed to cost-push theories. Their actual rejection of such theories did not occur until a little after the Burns era. With regard to

---

[130] See Nelson (2020b) on these alternative accounts.
[131] From Burns' letter of June 3, 1975, to Patman, as reproduced in Lindsey (2003, p. xvi).
[132] For example, Robert Holland, at different times a staff member and governor of the Federal Reserve Board, wrote that as "secretary of the Federal Open Market Committee during the year 1972, [I] was responsible for an accurate rendition of what took place at its meeting." (*New York Times*, September 1, 1974.)
[133] A similar position was taken later by Meltzer (2009b).

individual policy decisions, Friedman would lament in 1988 that FOMC policy documents told him the policy actions take but not "the policy that produced these actions" (*Wall Street Journal*, April 15, 1988). This conclusion, however, was flawed by a failure to consider a wider body of official policy materials the Federal Reserve had put on the public record, including the policy minutes. Romer and Romer (1994b, p. 81) found that these materials were informative about "the purpose of the policy" underlying FOMC behavior in 1987–1988. This was the very period for which Friedman in 1988 had complained Federal Reserve public documents were unrevealing about the consideration driving monetary policy.[134]

In contrast to his jaded post-1974 attitude toward FOMC communications, Friedman was more on track earlier when, in 1970–1974, he indicated that he understood the thinking behind Federal Reserve decisions but that he disagreed with that thinking. And with regard to the reaction function, in the late 1960s and, in the early 1970s, both he and Samuelson indicated they saw systematic aspects in the Federal Reserve's reaction function; again, in Friedman's case the key objection was disagreement with the reaction function followed.[135]

Specifically, before 1975 Friedman's reservations stemmed not from a notion that the Federal Reserve's reaction function could not be ascertained, but instead on the fact that the reaction function followed did not give rise to a predictable pattern for monetary-growth; in addition (though relatedly), he objected to the absence of an articulated, announced long-term plan by the Federal Reserve. He favored a different instrument (reserves or the monetary base), with a changed implied reaction of interest rates to the state of the economy than prevailing previously, alongside public announcement of target rates of monetary growth. And once the Federal Reserve adopted formal monetary targets in 1975, neither the instrument choice nor the reaction function seemed to Friedman best suited to achieve those targets.[136]

---

[134] See the coverage of 1987-1988 monetary policy on pp. 81–82 of Romer and Romer's (1994b) section, "Monetary Policy Since 1987." Their analysis drew on the Record of Policy Actions (the then-name for the FOMC meeting minutes), which had been reprinted in the same Federal Reserve Board (1988) *Annual Report* that Friedman had criticized as vacuous.

Friedman and Schwartz's own work had demonstrated that the public documents of the Federal Reserve were revealing about the reasons for policy decisions. This is brought out by the fact that for a quotation from the Federal Reserve regarding the reason for the 1936 decision to increase reserve requirements, Dewald (1975, p. 154) cited "Federal Reserve technical memorandum quoted in Milton Friedman and Anna J. Schwartz, *A Monetary History of the United States*…" The quotation (indeed used by Friedman and Schwartz, 1963a, p. 526) actually came from the Federal Reserve Board's annual report, not an internal memorandum.

[135] For documentation of these points, see Nelson (2020a, Chapter 8; 2020b, Chapter 15) and Chapter 2 above.

[136] In this later period, Friedman layered onto his technical objections to the Federal Reserve's reaction function criticisms that reflected his acceptance of the public-choice literature's arguments. For example, he argued that

Rather than positing a relationship between transcripts and disclosure of the reaction function, Friedman's 1976 letter focused on the transcripts' historical value. He called for the Federal Reserve's creation of Memoranda of Discussion to be resumed and for their release to be two years, rather than five years, after the meetings.[137] This two-year suggestion implied he likely had some sympathy with the Burns position that a too-rapid release of the transcripts would limit the candor of the meeting discussions. It is also notable that, even during his post-1974 era of enhanced cynicism regarding the reliability of public statements by the Federal Reserve, Friedman did not himself argue that rapid (that is, a same-year, and perhaps near-immediate) transcript release was necessary for clarity about the reaction function. In contrast, in his own letter to Neal, Robert Lucas (1976a) argued that immediate release of the FOMC transcripts was necessary, in order for the FOMC's reaction function to be known by the public.

The Burns FOMC was not really very secretive about its reaction function, as it did relate policy-rate decisions to the state of the economy. It is true that, as already noted in Chapter 5, Burns did not want to disclose his intentions or the FOMC's and tensions regarding *future* interest rates. But the disinclination to engage in discussion about interest-rate prospects (that is, about the interest-rate values that are most likely in future periods) is, in principle, separate from transparency about the reaction function (that is, about the mapping between current monetary policy decisions and the state of the economy). And, as it turned out, the FOMC transcripts for the later Burns years did not turn out to be particularly forthcoming on policymakers' assessments interest-rate prospects. They were instead marked by much the same tendency to avoid discussion of the future rate decisions as that Burns exhibited in public. As Burns said on the record in 1977, "I won't talk about the future. I don't know what the future will be." (*Wall Street Journal*, October 7, 1977, p. 33.)

In the Burns era, as in other periods, the transcripts supplemented and fleshed out information on the FOMC's decision-making. But they were not a unique or even essential source for grasping the thrust of Committee thinking. Rather, they supplemented voluminous material that was in the public record far earlier than the transcripts. Indeed, the FOMC transcripts for the second half of the 1970s, as eventually released, verified that parts of the public record that Friedman and subsequent writers sometimes dismissed as mere disinformation for public consumption—such as the Federal Reserve's continued appeal to cost-push explanations for inflation, and

---

central-banking and commercial-banking interests were opposed to reforms of monetary-control procedures, and that the political environment was a force working against implementation of a noninflationary monetary policy.

[137] Friedman (1976g, p. 202).

Arthur Burns' contention that monetary policy was not overexpansive in 1976 and 1977—actually reflected the positions genuinely taken by policymakers, as they also articulated them in their internal deliberations.

The largest missing element among the information released publicly by the Federal Reserve in the 1970s consisted of high-frequency releases about FOMC decisions. The actual policy decision made at any FOMC meeting was typically not subject to a formal public disclosure until the release of the meeting minutes some weeks later (although financial observers were usually able to glean the essence of the decision well ahead of that time, by observing the open market operations taken by the Federal Reserve after the meeting). Friedman's 1976 letter had called for ending this situation, by having the FOMC's policy directive be made public immediately after the FOMC meeting.[138] The problem of the absence of immediate postmeeting official information was not resolved until 1994, when, under Alan Greenspan, the FOMC started the practice of releasing a policy-decision statement immediately after each meeting.

Although this gap in information prevailed throughout his tenure, in other respects Arthur Burns seemed to take to heart—in his later years as Federal Reserve Chairman—the criticism that the Federal Reserve was insufficiently transparent. A few weeks after *Business Week* (April 28, 1975) editorialized that "Arthur Burns should stop playing a man of mystery," the *Washington Post* (May 22, 1975) published an article titled "Arthur Burns Goes Public," which highlighted his recent agreement to give a television interview for NBC's *Meet the Press*. Burns followed this with other public media engagements, including an appearance of ABC's own Sunday morning news show, *Issues and Answers* (January 18, 1976), a long interview with *U.S. News and World Report* (May 17, 1976), and press conferences in November and December 1976 (*Washington Star* (Washington, D.C.), November 25, 1976, and December 6, 1976).[139]

Furthermore, with regard to the FOMC, Burns in 1975 and 1976 presided over moves to more-rapid release of the meeting minutes. Under his tenure, the lag between FOMC meetings and meeting minutes' public disclosure went down from the ninety days introduced in 1967, to 45 days, then to about a month—so that, by the time of new FOMC meeting, the minutes for the previous meeting were already publicly available (*Washington Star* (Washington, D.C.), November 25, 1977, p. A–6; Lindsey, 2003, pp. xi, 14–17).

---

[138] Friedman (1976g, p. 202).

[139] It was earlier reported (*Washington Post*, May 22, 1975) that Burns was considering having a press conference every six weeks as a permanent arrangement—a proposal with which he did not ultimately proceed. (Burns had also held press conference on rare occasions before 1975—see, for example, *Seattle Times*, October 15, 1973.)

These efforts at greater transparency would, however, be enormously overshadowed by a countervailing action on Burns' part, taken in 1976 and disclosed in 1993, that would put paid to any prospect that he would be remembered as being forthcoming about monetary policy. As noted above, in 1976 the FOMC strongly implied, via its announcement that it would discontinue its Memoranda of Discussion, that it would no longer be keeping meeting transcripts.[140] In fact, this was an untruthful impression. The Federal Reserve continued to make, and keep, transcripts of FOMC meetings from 1976 for internal purposes.[141] Indeed, Burns took his own copies of the transcripts from his tenure with him when he left the Federal Reserve in 1978, and these were included in the papers he subsequently deposited with the Gerald Ford presidential library (see Lindsey, 2003, p. 13). Friedman and Schwartz were among those criticizing the Federal Reserve when, in 1993, the fact of the withholding from the public of the existence of the transcripts became widely known (*Wall Street Journal*, December 20, 1993). The practice of releasing transcripts five years after an FOMC meeting was subsequently restored, and the Federal Reserve also published the meeting transcripts from the 1976–1993 period.[142]

The end of the Burns era

Burns' second term as Federal Reserve Chairman was due to expire at the end of January 1978. When Jimmy Carter was elected, Friedman speculated that, if Carter chose not to reappoint Burns, the most likely nominee for the Chair position was Arthur Okun (Instructional Dynamics Economics Cassette, Tape 202, November 1976, Part 1). However, a year later, Okun publicly ruled himself out of consideration for the position (*Washington Post*, November 18, 1977).

[140] Similarly, Chairman G. William Miller later stated: "Those Memoranda of Discussion, of course, have been suspended recently; I hope that they will be reinstated, so that there will be a historical base for analyzing decisions." However, he also said that he was still "learning about" the FOMC meeting process, and he may not have known that meeting discussions were still being transcribed—and that what had been suspended was (only) the preparation of a public version of the transcripts. (The quotations are from Miller's testimony of April 10, 1978, testimony, in Committee on Banking, Finance and Urban Affairs, 1978b, p. 127.)
[141] This usage appears to have been limited to the creation of the public minutes, which then became the main record of the meeting consulted, rather than for regular referencing in place of the minutes. Consistent with this, Federal Reserve Chairman G. William Miller said to a Congressional questioner on April 10, 1978: "the minutes that I have [of the February 1978 FOMC meeting] are the same that you have" (in Committee on Banking, Finance and Urban Affairs, 1978b, p. 125).
[142] The 1970s Memoranda of Discussion up to 1976 that had not been released by 1976 had already been released on the five-year-lag schedule. For example, writing in 1978, Poole (1979, pp. 478–479) used the Memoranda of Discussion through 1972 (though referring to them as "*FOMC Minutes*") used the Memoranda of Discussion through 1972, while in the same proceeding Jordan (1979, p. 497) noted that the coming years would see the public release of the Memoranda of Discussion for 1973, 1974, and 1975. (Those prepared for early 1976 were released as well.)

By this time, Friedman had actually come to the view that Carter would likely decide to reappoint Burns, despite the public airing of several disagreements between the president and the Federal Reserve leadership. Having Burns at the head of monetary policy, Friedman reasoned, meant that the administration could be critical of the Federal Reserve, rather than being associated with its policies.[143] In mid-December 1977, Friedman assessed that the "chances are good" that Burns would be reappointed (*St. Louis Globe-Democrat*, December 16, 1977). But on December 28, 1977, Carter announced that he would be nominating a new candidate, G. William Miller, for Federal Reserve Chairman (*Dallas Morning News*, December 29, 1977).

Friedman expressed doubt that Carter's decision would have much bearing on events. "On very few occasions in the past," he remarked in reaction to the Miller nomination, "has the name of the man who is chairman of the Fed made much difference." (*New York Times*, December 30, 1977, p. D3.)[144] "Policy is unlikely to change," Friedman observed (*Journal of Commerce* (New York), December 30, 1977). In particular, he had already indicated that he expected inflationary policies to continue whether Burns was reappointed or not.[145]

Shaping Friedman's judgment was the tenure of Arthur Burns. Speaking before the Miller nomination was announced, Friedman alluded to his 1969–1970 euphoria over Burns' initial nomination and appointment (see Nelson, 2020b, Chapter 15) when he noted that "the name of the man who is Chairman of the Federal Reserve Board makes far less difference than at one time I thought it did."[146]

For the moment, the perception of Burns among news and financial commentators lined up with the characterization given in a *Wall Street Journal* article (May 4, 1977) that "Mr. Burns is perhaps the nation's best-known inflation fighter." In contrast, shortly before the announcement that Burns would not be reappointed, Friedman would describe him as having presided over "a Fed which is promoting inflation" (*St. Louis Globe-Democrat*, December 7, 1977). Friedman saw the esteem in which Burns was held by others as par for the course, and he would later declare that "[n]o major institution in the United States has so poor a record of performance over

---

[143] Friedman offered this scenario both in Instructional Dynamics Economics Cassette Tape 208 (February 1977, Part 1) and a talk at the Commonwealth Club of San Francisco on November 11, 1977 (see Friedman, 1977k, p. 494).
[144] Friedman made a similar remark in Friedman (1982a, p. 103).
[145] See Friedman (1977k, p. 494) and *St. Louis Globe-Democrat*, December 7, 1977.
[146] Instructional Dynamics Economics Cassette Tape 215 (January 1978; recorded in December 1977).

so long a period yet so high a public reputation as the Federal Reserve."[147] However, with regard to Burns specifically, Friedman's verdict on the Chairman's record would, in the years after 1977, become much more widely accepted. For example, in 1987 the *Financial Times* judged that Burns had "enjoyed starry-eyed respect on Wall Street for longer than his track record probably justified."[148]

Contributing greatly to these retrospective judgments—as well as buttressing the negative verdict on Burns that Friedman was voicing during 1977—was monetary policy's behavior during Burns' final year or so as Federal Reserve Chairman. In an assessment written a little while before Burns left office, Friedman stated: "Monetary policy during 1977 was not in my opinion conducted effectively." The new monetary explosion, Friedman said, meant "we have, for the fourth time in fifteen years, paid the cost of a recession to stem inflation and then thrown away the prize by starting off on a new inflationary path."[149]

The same letter criticized what Friedman called the Federal Reserve's "futile attempt to control interest rates." Indeed, Friedman saw the Federal Reserve's reliance on the federal funds rate as a major factor behind the resurgence in monetary growth. Although Burns' FOMC had raised the federal funds rate during 1977, Friedman believed that the Federal Reserve had been too slow in doing so and had thereby permitted rapid monetary growth.[150]

Such a pattern largely repeated what had been observed earlier in Burns' tenure. For example, a research article published in 1977 on the Federal Reserve's federal funds rate reaction function found, on the basis of a sample period of December 1970 to December 1974, that "the Federal Reserve has been willing to move its operating instrument by only relatively small magnitudes, on average, in response to undesired growth in money" (DeRosa and Stern, 1977, p. 218). This regularity was prevalent not only in the first half of the 1970s but over almost the whole decade. In the 1980s, Friedman would note that the two years after formal monetary targets were introduced in 1975 did not lead the Federal Reserve to abandon stabilizing interest rates in the

---

[147] Friedman (1984a, p. 24). Friedman made a related observation in *Newsweek*, May 2, 1983, as well as a near-identical remark in the *Wall Street Journal*, April 15, 1988.
[148] This judgment appeared in an editorial of May 26, 1987, a month before Burns' death.
[149] Friedman (1978d, p. 156).
[150] Jerry Jordan likewise judged (in *American Banker*, March 24, 1983, p. 10) that the FOMC "resist[ed] rising market interest rates in 1977 and 1978 by rapid injections of money and credit." It happens, as discussed below, that this characterization applies more to 1977 than to 1978, at least if M2 (rather than M1, the aggregate that Jordan tended to prefer at the time) is used as the measure of money.

short run.[151] The retrospective judgment of David Lindsey, Friedman's former student and a Federal Reserve Board staffer in the later Burns years, affirmed that this stabilization pattern had been at the expense of longer-run monetary and macroeconomic stability. "The results for inflation in the 1970s suggested that the FOMC had acted 'too little too late,'" Lindsey remarked in a 2003 Federal Reserve Board staff memorandum.[152]

It was a severe disappointment to Friedman that Burns' FOMC did not genuinely change the Federal Reserve's operating procedures and had, instead, maintained the federal funds rate as its operating instrument. Burns opposed a move to a reserves-control system to the end: in a September 1977 letter, the Chairman maintained that "technical adjustments in our procedures… would not improve matters" (quoted in *American Banker*, October 3, 1977, p. 3). To Friedman, this position was symptomatic of Burns' having become a "captive of and spokesman for the bureaucracy he supposedly commands" (*Newsweek*, July 24, 1978).

Indeed, the issue of monetary control ranked close to the topic of incomes policy as a source of strain between Friedman and Burns. One of the senior staff at the Federal Reserve Board of the time, and a former Friedman student, Stephen Axilrod, observed of Burns and Friedman, "Their very close friendship, I think, kind of broke up because they didn't agree on the money supply… Milton became really ticked off. I can't remember all the letters I wrote to him, over Burns' signature, on this subject, but there were a lot of them—maybe three; and, on this subject, three is a lot."[153] Axilrod, however, traced Burns' resistance to changes in monetary-control arrangements less to the staff influence than to the fact that "Burns, essentially, did not believe at all in money." (Stephen Axilrod, interview, April 24, 2013.)

Paul Volcker, who observed the Burns/Friedman relationship first from the vantage point of the U.S. Treasury (from 1971 to 1974) and then (from August 1975) as president of the Federal Reserve Bank of New York, observed that "they were deadly enemies. Though it was funny, because Friedman was a student of Burns. But Burns was very unhappy with [Friedman's

---

[151] See Friedman (1982a, p. 108) and Friedman and Friedman (1985, p. 95).
[152] Lindsey (2003, p. x).
[153] In addition to direct correspondence with Friedman about monetary-control issues, Burns had to write or commission Federal Reserve replies to Congress' expressions of interest in Friedman's proposals in this area. Chapter 4 above gave one such example: the exchange stemming from Friedman's November 1975 Congressional testimony. An earlier example occurred in 1971, when Burns wrote a letter (dated May 3) to William Proxmire, who had asked for a response to Friedman's *Newsweek* column (May 3, 1971), "Money Explodes." As was his custom by this point, Burns made mininal reference to Friedman: he mentioned him fleetingly at the start of his three-page, single-spaced letter (see Burns, 1971b).

outlook]… I'm trying to reconstruct a personal relationship insofar as I knew it, and I didn't know it all that much. But I did know that, intellectually, they'd become enemies." (Paul Volcker, interview, October 16, 2013.)

During 1977, Burns did affirm the desirability of slowing the growth in the money stock over time, as already indicated. However, in response to a statement by Allan Meltzer, who had said, "The Fed simply tried too long to hold down short-term interest rates," Burns defended compromising between stability in short-term interest rates and achievement of the monetary targets. He maintained that, in seeking a reconciliation between these goals, "I'm a quasi-monetarist" (*Wall Street Journal*, October 7, 1977).

With the announcement of Burns' departure, Friedman seemed relieved that he would no longer have to criticize Burns on current monetary policy matters. He opined that Burns could "render greater service" as a private citizen than as a policymaker (*Journal of Commerce* (New York), December 30, 1977). He looked forward to Burns having more time to participate in public discourse on nonmonetary economic issues, such as the role of the public sector, on which Friedman felt Burns had spoken eloquently while Chairman (*Newsweek*, January 9, 1978*a*).[154]

Friedman's relationship with Burns, already considerably improved by 1978 over its state earlier in the decade, would subsequently move back toward its previous state of amicability. Gloria Valentine (interview, December 5, 2013) noted that in her initial years as Friedman's secretary Burns was "angry with Professor Friedman about his criticism of the Fed," and she observed that, after leaving office as Federal Reserve Chair, "Arthur Burns came and visited Hoover, and he and Friedman talked; it was as if they had never had a problem." Burns and Friedman would work together on Republican candidate Ronald Reagan's economic team during the 1980 presidential election campaign (see Chapter 10).

In these circumstances of restored relations, Friedman was reluctant after 1978 either to criticize Burns' record or to recount in detail his previous criticisms of Burns—though he occasionally did both of these things.[155] This self-denying ordinance was likely reinforced by the reality that,

---

[154] Friedman also had some favorable things to say regarding Burns' statements concerning monetary policy. See the discussion titled "G. William Miller" in the next section.

[155] Silber (2012, p. 150) notes that Friedman did not mention Burns in his *Newsweek* column of February 19, 1979, which criticized the monetary policy of the 1970s. However, most inaccurately, Silber (pp. 150, 151) suggests that Friedman's columns *never* held Burns accountable for the inflation of the 1970s, a claim that overlooks many of Friedman's columns (and other commentaries) during Burns' tenure. (The earliest Friedman *Newsweek* column that

once appointed U.S. Ambassador to the Federal Republic of Germany in mid-1981, Burns was in no position to respond publicly to criticism, as well as by the fact that Friedman largely supported the Reagan Administration foreign policy that Burns had been assigned to help pursue. When, however, the subject of monetary policy in the 1970s came up in his research or policy writings, Friedman repeated his earlier criticisms, and he would remain willing to name Burns on occasion in that context.[156]

Friedman's continuing wish to put distance between his and Burns' views on monetary policy showed up in other ways, too. When Burns left the Federal Reserve in early 1978, he joined Washington, D.C.'s American Enterprise Institute (AEI), with which Friedman was already affiliated. Later in 1978, the AEI released a massive book collecting a large number of Burns' speeches as Federal Reserve Chairman.[157] The only mention of Friedman in the book (Burns, 1978) was a listing of him, ahead of the contents page, on the AEI's Council of Academic Advisers. The listing was routine, but it did give the appearance of Friedman's participation in approving the book for publication. In fact, the book could not meaningfully reflect the AEI advisers' input, as it was simply a reprint of published speeches. And these speeches included several Friedman had criticized over the years, including the notorious Burns (1970) advocacy of incomes policy that had triggered their initial rift (and which had not even been previously printed in the *Federal Reserve Bulletin*).

In a past era, during Burns' years of NBER seniority, two large books coauthored by Friedman had each contained, at the NBER leadership's insistence, an appendix consisting of a rebuttal to the contents of the main text penned by a NBER director. At the AEI, Friedman's advisory position was somewhat analogous to that of the NBER directors, as both these positions implied some role in giving advice on publication approval. Notwithstanding this parallel, there was no possibility that a Friedman reply to Burns' monetary views would appear in Burns' AEI book. This would not have been acceptable to Burns. Nor would Friedman have been well disposed toward writing one, in view of his inclination to let sleeping dogs lie when it came to his previous arguments with Burns on monetary policy. But the Burns speech compendium

---

Silber considers was written after Burns' successor had been named.) For many counterexamples, see Nelson (2013a; 2016; 2020a, Chapter 5).

[156] For example, Friedman named Burns (as well as Martin and Miller) in his indictment of monetary policy since the early 1960s, for example in the *Free To Choose* television series (U.S. version, Episode 9, "How to Cure Inflation," March 7, 1980, p. 6 of transcript), *Newsweek*, May 2, 1983, Friedman (1984a, pp. 27, 55), and Taylor (2001, p. 105). See also Chapter 11 below.

[157] Beyond these, the book also included one speech delivered in 1969 and another given in September 1978.

appeared when Friedman, who was in any event in the process of cutting his ties to the East Coast, was becoming increasingly worried that the appearance of his name as an academic adviser in AEI books might give the appearance of approval of or consultation on the contents—when he certainly had not been for books such as Burns (1978), and in contrast to the past he no longer had the time or disposition to review AEI books, if asked. Against this background, Friedman relinquished his affiliation with the American Enterprise Institute, including his advisory position, in 1979.[158]

A glimmer of praise for monetary policy in the late phase of Burns' tenure was discernible from a remark Friedman made in a *Newsweek* column in 1981. Although his 1978 article on Burns' imminent departure had observed that "the actual rates of monetary growth, as determined by the Fed with Arthur Burns as chairman, have risen rather than decreased" in recent years (*Newsweek*, January 9, 1978*a*, p. 53), Friedman would subsequently grant, in his *Newsweek* of column of June 15, 1981, that monetary growth had begun to slow in late 1977.

This finding was based on the modern (post-1979) definition of M2. However, Friedman had earlier made a similar judgment on the basis of the old definition of M2 and had indicated that monetary growth started coming down in October or November 1977 (*Newsweek*, April 24, 1978; *The Register* (Orange County, California), December 23, 1979, p. E11).[159] This result is also evident in Table 1 above. That table shows that, in the case of both old and new M2, monetary growth at annualized quarterly rates moved out of double digits during 1977. For the twelve-month growth rate, the shift out of double digits was somewhat later: in January 1978, new M2 was 9.8 percent above its level a year earlier—high, but the first single-digit rate recorded since June 1975.

Later studies by Sims and Zha (2006) and Bianchi, Lettau, and Ludvigson (2018), utilizing modern econometric techniques and variously drawing on monetary-growth and interest-rate data, have affirmed Friedman's position that the switch away from an inflationary monetary policy began in late 1977—earlier than the oft-cited October 1979 date.

Thus, at the tailend of Burns' tenure, the Federal Reserve had begun to end the second monetary explosion. This policy tightening would continue under Burns' successor.

---

[158] See Friedman and Friedman (1998, p. 344).

[159] In the same vein, Friedman in the *Chicago Tribune* (April 2, 1978, p. A7) gave the period of very rapid monetary growth as the year 1976 and early 1977.

III. PERSONALITIES IN DEBATES ON MONETARY POLICY AND MACROECONOMIC STABILIZATION, 1977–1978

G. WILLIAM MILLER

It seemed to some observers that G. William Miller had come from nowhere to be in charge of U.S. monetary policy: the first *Newsweek* issue to appear following his nomination described him as an "unknown quantity" (*Newsweek*, January 9, 1978*b*). But Miller had, in fact, established a profile on national economic issues for some years. The statements that Miller (as head of Textron, Inc., based in Providence, Rhode Island) made in these contributions did indicate a few areas of agreement with Friedman on economic issues. For example, Friedman had long been an advocate of relaxation of travel and nonmilitary trade with the USSR and China (see Chapter 10). So too was Miller: he had made headlines in 1966 when he obtained permission from the State Department to visit China (*The Detroit News*, July 13, 1966), and in 1970 Miller arranged a visit the USSR to encourage commercial relations (*Tampa Tribune* (Florida), May 5, 1970). But there were also areas of major disagreement, as discussed below.

Miller, who had been head of Textron since 1960, remarked in 1974: "I love the job and have lots of fun doing it. One problem, though: I don't see how I can get a promotion." (*Boston Globe*, February 4, 1974.)[160] President Carter would remedy this problem by nominating Miller to a leading position in national economic policy, and Miller was confirmed by the U.S. Senate as the new Federal Reserve Chair in March 1978.

Miller and macroeconomics: 1969 to March 1978

Miller did not have Burns' background of formal economics training, and he did not claim otherwise. "I cannot profess to have the qualifications to step in[to] Dr. Burns' shoes," Miller remarked alongside Carter and Burns at the press conference announcing his nomination (*Dallas Morning News*, December 29, 1977). A couple of months later, in a Congressional hearing held about a month after Miller was sworn in, a legislator began haltingly, "Dr. Burns—Dr. Miller,"

---

[160] Although he was head of Textron throughout the 1960–1978 period, the formal positions Miller occupied in the firm varied somewhat over time. He was chief executive officer 1968–1978, president 1960–1974, and chair 1974–1978. He had joined the firm in 1956 and been its vice president from 1957 to 1960 (Europa Publications Limited, 1986, p. 1095).

promoting Miller's reply, "Neither Dr. Burns nor Dr. Miller is here!"[161]

Miller was, however, not new to monetary policy, as he had been serving for many years on the board of directors of the Federal Reserve Bank of Boston. This was not a *bona fide* policymaking position. It was nevertheless a senior (though part-time) role—one that involved receiving briefings on the economy and monetary policy, as well as consultations with the bank president (who, being an FOMC meeting participant, actually *was* a policymaker). Duesenberry (1983, p. 126) contended that, notwithstanding Miller's success in the private sector, it was really his Federal Reserve Bank of Boston service that put him in the running for the Federal Reserve Chair position. Duesenberry also suggested that, during this service, Miller had been schooled in Federal Reserve System practices by the bank's president, Frank Morris. As already indicated, Morris believed in the late 1970s that the tide was turning away from Friedman's ideas; consequently, it is likely that the impression conveyed to Miller of Friedman's economics from Morris' schooling was far from favorable.

In his capacity as a director, Miller also attended some of the Federal Reserve Bank of Boston's research events. As early as June 1971, for example, Miller was an attendee of the bank's conference on consumer spending and monetary policy. This event attracted not only Keynesian luminaries like Duesenberry, Modigliani, Tobin, and Garder Ackley, but also Friedman's former students Phillip Cagan, David Meiselman, Richard Selden, and Beryl Sprinkel, as well as his former teacher, Homer Jones.[162]

Furthermore, as a board member, Miller interacted with Robert Solow, who overlapped with him as a director. Solow recalled, "I was the only economist on that board, other than Frank Morris." Consequently, Solow recalled, "I took it on myself to explain economics and to explain the role of the staff—the research staff of the Fed, and their findings, and all of that—to the rest of the board... So that was the role I played." With regard to his impressions of Miller from these interactions, Solow observed, "I thought he was very sharp, and very smart. I don't think he understood economics very well... But in terms of IQ… [and] just pursuing a line of thought, an argument, I thought he was pretty impressive." (Robert Solow, interview, July 7, 2014.)[163]

[161] From the hearing of April 10, 1978, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1978b, p. 129).
[162] See Federal Reserve Bank of Boston (1971, pp. 327–328).
[163] In January 1977, Miller favorably referred in public to Solow's macroeconomic writings (Miller, 1977, p. 341).

During the leadup to 1978, Miller made a fair number of contributions to public discussions of economic stabilization policy and of price-setting. These statements indicated that, however unhappy Solow was with the quality of Miller's economic analysis, that analysis had even more substantial differences with Friedman's perspective on economics.

An early example is provided by a statement Miller made in early 1969. Although he himself was the head of a conglomerate, he called for an inquiry into conglomerate mergers (*The Detroit News*, January 31, 1969). This move was perhaps an endorsement of the view—prevalent at the time—that increased concentration of industries was among the factors driving high inflation. The notion that Miller subscribed to cost-push views of inflation is reinforced by his comments he gave in a *Business Week* guest op-ed in 1974 (an article earlier discussed by Romer and Romer, 2004, pp. 155−156). In this piece, Miller did not specifically claim what he called "controlling the aggregates—the supply of money and net federal spending" could not reduce inflation. But he contended that there were alternative means of achieving disinflation that did not entail short-run output losses. In addition, although Miller's analysis criticized direct controls on wages and prices, it proposed a mixture of control and decontrol on other dimensions: for example, for firms, Miller proposed introducing more tax incentives and lower regulation, but he suggested introducing selective controls on consumers and removing, for two or three years, labor unions' option to go on strike, in favor of a compulsory arbitration system (*Business Week*, October 5, 1974).

Miller's economic views also got a measure of national exposure via a speech on the macroeconomic scene that he delivered in Pittsburgh in January 1977. The periodical*, Vital Speeches of the Day*, decided to publish the speech in its March 1977 issue. In the same issue, *Vital Speeches* printed a talk, "The Future of Capitalism; The Intellectual and the Businessman," given at Pepperdine University, Los Angeles, California, on February 9, 1977. The author of this speech was Milton Friedman.[164]

Another occasion over this period that saw Miller acquire a high profile in economic-policy discussions was when he testified in February 1977 to the U.S. House of Representatives' Committee on Ways and Means. Miller did so during the committee's hearings on the new

[164] See Friedman (1977l) and Miller (1977). Miller (1977) was previously analyzed by Romer and Romer (2004) and is touched on below.

administration's tax proposals.[165] In this testimony, he spoke in favor of the Carter Administration's proposed increase in the investment tax credit, but he added his own favored measure of region-specific rapid depreciation allowances for business investment. The contrast with Friedman's stand on this matter is notable. By this time, Friedman had warmed to the idea of an investment tax credit, in light of the apparent logjam facing other ways of reducing corporate taxes (Instructional Dynamics Economics Cassette Tape 197 August 1976, Part 1, and Tape 207, January 1977, Part 2). But the specific arguments Miller invoked for his tax-credit package were not ones on which Friedman looked favorably. Miller stated: "I prefer not to reduce corporate taxes generally, because then the reduction can simply go into the corporation's coffers and stay there."[166] In contrast, Friedman *did* want general corporate tax reductions, while Friedman's emphasis on monetary policy and aggregate demand made him unsympathetic to the view that whether a corporation saved or invested the proceeds from a tax cut was decisive for the path of aggregate demand.

Likewise, Friedman would have been unsympathetic with Miller's suggestion, in the February 1977 testimony, that the prominence of investment spending in the rise of U.S. aggregate demand during 1961−1965 was a major factor in allowing the economic expansion of those years to be noninflationary. The "established merits of capital spending as a means of creating jobs without unleashing inflation," Miller contended, made it appropriate to "suggest that there was a correlation among the economic growth, full employment, price stability[,] and expanded fixed investment."[167] In contrast, Friedman had stressed on numerous occasions (and would continue to do so) that forces that added to potential output, including capital spending, were typically minor factors in determining the course of inflation compared with monetary growth.

At his January 1978 confirmation hearings nearly a year later, Miller's portrayal of what monetary policy could do paralleled Burns'. Monetary restraint, Miller said, was a *necessary* part of controlling inflation, so "over time, working on inflation will mean lower [growth in]

---

[165] See Committee on Ways and Means, U.S. House of Representatives (1977). When Miller's nomination was announced, the *Irish Times* (Dublin) (December 30, 1977) referred to a "scouring of recent economic pronouncements by Mr. Miller" as having unearthed "a speech in Pittsburgh last January" (Miller, 1977), but it did not mention this testimony. (Romer and Romer, 2004, also cited and analyzed Miller, 1977, but not the 1977 Congressional testimony.) The testimony may have become little noticed because Miller was identified only as William Miller, not G. William Miller, in the hearings volume.
[166] From Miller's testimony of February 7, 1977, in Committee on Ways and Means, U.S. House of Representatives (1977, p. 370).
[167] From Miller's written submission in Committee on Ways and Means, U.S. House of Representatives (1977, p. 332).

money aggregates." However, he maintained that such monetary restraint on its own could not be expected, even by 1985, to restore price stability—it was "a mistaken hope to believe the Federal Reserve on its own could accomplish this, because the economic environment in which we live is made up of many factors."[168] Like Burns, Miller did not regard monetary restriction as sufficient to remove inflation.

In sum, although—shortly before Miller was formally confirmed as chairman—President Carter described Miller as having an "excellent understanding of economics in every respect," there was plenty in Miller's economic analysis that was inconsistent with an emphasis on monetary policy as an influence on aggregate demand and—especially—on inflation.[169] His positions were not very different from those of his predecessor or of many, perhaps most, academic economists at the time.[170] But they were very far indeed from Friedman's.

Miller on inflation control: 1978

Miller's first Congressional testimony as Chairman was on March 9, 1978 (the day after his swearing-in). His opening testimony affirmed that the FOMC intended its strategy of lowering monetary growth over time—policy settings that would "prove consistent with… a gradual winding down of inflation over the longer run."[171] But he included among "policies beyond the province of the Federal Reserve" included "this nation's ability to find a way to reduce the upward wage-price pressures that continue to plague our economy."[172]

In statements given later in the year, Miller continued to characterize inflation's causes—and, to a large degree, its control—as being outside the sphere of monetary policy. For example, when speaking at an October 1978 conference on productivity, Miller (1978c, p. 21) stated: "Monetary policy can be used to restrain inflation, but without coordination with other economic policies, it

---

[168] From Miller's testimony of January 24, 1978, in Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1978b, p. 43).
[169] The quotation is from Carter (1978a), which records remarks the president made on March 3, 1978.
[170] Romer and Romer (2004, p. 155) argued that the 5 to 5.5 percent natural unemployment rate they inferred from Miller's (1977) speech as "much lower" than that espoused by the Federal Reserve, and specifically Arthur Burns, in that period. However, a rate of about 5 percent for the full-employment unemployment rate was a common view in officialdom in 1977. As discussed in DiCecio and Nelson (2013), Romer and Romer's analysis of Burns' 1977 statements took him as believing that the economy was on the verge of overshooting potential output in 1977—when actually, as noted above, it seems that Burns' concerns in that year were about too-rapid growth creating inflation through bottleneck mechanisms. Like others, Burns in 1977 believed that notable slack existed.
[171] Miller (1978b, p. 188; p. 9 of typescript version).
[172] Miller (1978b, p. 189; p. 12 of typescript version).

offers substantial dangers of its own." He contended that recent years had seen "a cycle of intense upward pressure on costs and prices," as U.S. workers tried to maintain their real incomes, and he argued that dollar depreciation had further pushed up inflation.[173] Earlier in the year, he had said of President Carter's wage guidelines: "If businesses do not cooperate ... then we will have high rates of inflation."[174]

These statements, it should be stressed, did not amount to a dismissal of the importance of ending inflation. Miller actually stressed this as an imperative. For example, in April 1978, he testified: "I am in favor of making inflation our No. 1 priority in terms of domestic policy."[175] Rather, the above-quoted statements amounted to a different assessment on Miller's part from that of Friedman regarding the issues of how inflation arose and the appropriate means of removing it.

Friedman on Miller

On May 11, 1978, Friedman met Miller in Washington, D.C., when the Federal Reserve Board governors conferred with their panel of consultants. Friedman had been attending these consultants' meetings periodically since the panels were launched in 1965. This would, however, be the final such meeting Friedman attended. Friedman had become disillusioned with the meetings.

One reason Friedman was critical of these "meetings of so-called academic consultants" as a basis for a dialogue with the Federal Reserve concerned the role that the staff economists were assigned in them. Only Federal Reserve Board policymakers, and not the Board staff, interacted with the consultants during the formal proceedings of these events. The fact that, as Friedman

[173] Miller (1978c, p. 23). The prominence of developments in the exchange value of the dollar in discussions of U.S. inflation in 1977–1978 is further considered in the next chapter.
[174] From Miller's testimony of June 29, 1978, in Joint Economic Committee (1978a, p. 122).
[175] From Miller's testimony of April 10, 1978, in Committee on Banking, Finance and Urban Affairs (1978b, p. 135). Similarly, a little earlier in the *Chicago Tribune* (April 2, 1978*a* (Section 2, p. 8), Miller had stated: "I hope that we have the courage to make inflation our highest priority for domestic economic policy right now."

Romer and Romer (2004, p. 155) referred favorably to previous retrospectives that had suggested that "it was apparent before Miller was appointed that he was primarily concerned about employment and growth and, hence, would run [an] inflationary policy." However, as discussed below, neither the very important Romer-Romer analyses of Miller's tenure as Federal Reserve Chair, nor other detailed accounts including that provided below, support the notion that Miller pursued deliberately inflationary policies or even that he loosened monetary policy. Furthermore, as both the quotation just given and those below indicate, Miller was not a subscriber to the position that inflationary policies were a successful means of achieving a boost to the economy, and he put stress on the need to remove inflation.

put it, “the many Federal Reserve personnel [attending] sat around the sides of the Board Room, where the meeting was invariably held, without participating,” made these occasions more stilted than the various meetings in which Friedman had participated at the Federal Reserve Banks of Chicago, St. Louis, and (most recently) San Francisco.[176] At these district-bank events, both policymakers (the bank presidents) and research staff had been Friedman’s interlocutors.

A deeper reservation Friedman had about the Federal Reserve Board panel meetings pertained to whether the events really amounted to meaningful consultations. This reservation had made him reluctant to continue accepting invitations to join the panels. Although he had attended one Board consultants’ meeting a year from 1971 to 1975, and he then appeared at the April 1976 meeting that rolled out the findings of the monetary-statistics committee (on which he had served), Friedman was absent from the subsequent panels that convened in October 1976, February 1977, and November 1977. “Milton stopped coming,” Stephen Axilrod recalled (April 24, 2013). “I asked him about it once. He said, ‘Well, I had no influence.’”

However, after making this observation to Axilrod, Friedman did accept the invitation to the May 1978 event, the first consultants’ meeting to be held under Miller. As of then, and for some time beyond, Friedman held out hope that Miller would be more receptive than Burns had been to the operational and strategic changes in monetary policy that Friedman was recommending. Nevertheless, by the time the May 1978 panel convened, Friedman’s negative perspective on the consultants’ meetings had firmed. Friedman later complained that “the choice of the particular consultants invited to attend seemed designed to guarantee offsetting and contradictory advice, leaving the Fed free to pursue its own devices.”[177] The May 1978 meeting would not have struck him as an exception to this pattern.[178] This meeting of the Board of Governors and the economic consultants had two sessions: one in which a monetarist (William Poole) analyzed monetary control, with Paul Samuelson as a discussant; and another in which a Keynesian (Arthur Okun)

[176] The quotations in this paragraph are from Friedman (1982a, p. 105). The information he conveyed here was not correct in two respects. First, some of the later consultants’ meetings, including the May 1978 meeting, were held in Dining Room E in the Federal Reserve Board’s Martin Building (which was opened in 1974), instead of the Board Room in the Board’s Eccles Building. (The Board Room would have been the more memorable location, as consultants would be seated at the same long table used for FOMC meetings.) Second, by the late 1970s, the panel convened at these meetings was formally referred to as the Economic Consultants rather than academic consultants, as an early innovation in Arthur Burns’ tenure as Board Chairman had been to bring in nonacademic private-sector economists as panel members.
[177] Friedman (1982a, p. 105).
[178] The information that follows is based on Federal Reserve Board records.

gave a presentation on current monetary policy, with Milton Friedman as his discussant.[179]

As he concluded his discussion of Okun's presentation, Friedman "said he was never coming again," recalled David Lindsey, the former Friedman student who, on that day, was among the many staff economists in the audience for the meeting.[180] "He welcomed Miller as the new chairman and said, 'You know, I've been coming to these for a long time and giving advice, and they never listen to me, and I'm not coming again.' And Paul Samuelson said, in response, 'I consider it an honor to be invited to these [meetings]; and I'm happy to give my opinion, whether you take it or not, and as long as you keep asking me, I'll keep coming back.' So, Samuelson, who I disagreed with mostly, was quite generous and cordial whereas Friedman [on this occasion] was a little bit of a jerk, I thought." Friedman did stay for the rest of the meeting, as well as the subsequent luncheon with the staff and the Board governors; so "he didn't get up and stomp out; but it was virtually like that." (David Lindsey, interview, May 2, 2013.)[181]

Despite the tone he had conveyed with his appearance at this meeting, Friedman in 1978 saw reasons for optimism about Miller's ascension. Ahead of the May meeting, he had said to Stephen Axilrod that policymakers "might pay attention now" to monetarists' suggestions now that Miller was Chairman (Stephen Axilrod, interview, April 24, 2013). And a week or so before the consultants' meeting, Friedman had given a negative retrospective on Arthur Burns' performance as Federal Reserve Chairman and added, "Let's hope it will be different with Miller."[182] Asked later in the month to provide an assessment of Miller, Friedman said, "His

---

[179] Although known, thanks to Poole (1970), for having provided theoretical support for the interest rate as a monetary policy instrument, William Poole in the late 1970s and early 1980s was an advocate of a reserves-based operating procedure: he judged in Poole (1979, p. 479) that "Burns' failure to reform Federal Reserve operating procedures… was responsible for many of the policy mistakes of the era." Consequently, he would have advocated a position at the consultants' meeting one opposite to that of his discussant, Samuelson. As for Arthur Okun, he had criticized the increases in the federal funds rate in Burns' final year in office (*Washington Post*, November 18, 1977) so, on this and other grounds, the position he voiced at the discussants' meeting would have differed greatly from that of his discussant, Friedman.

[180] Those staff members did not include Janet Yellen, who was an economist at the Federal Reserve Board in 1977−1978 (see *https://www.brookings.edu/experts/janet-l-yellen/*). Her absence from the audience may have resulted from limitations on staff attendance of the meeting or, alternatively, it may be that, by May 1978, she had already left for the United Kingdom to start a new position at the London School of Economics.

[181] Thomas Simpson—like Lindsey, a Ph.D. graduate of the University of Chicago who worked at the Federal Reserve Board in this period—similarly recalled Friedman relaying the same message to him on the day of the event. "He said, 'You know, I've gotten invitations to these things. I used to come because I've got people would listen to me and it would make a difference. But,' he said, "I've come to realize that it's kind of a waste of my time to come here, and I'm not so sure I want to participate.' He said, "The only reason I came here today is that you got a new chairman, and I was curious, in terms of meeting him.'" (Thomas Simpson, interview, May 29, 2013.)

[182] *Evening Gazette* (Worcester, Massachusetts), May 3, 1978.

statements to date are excellent. However, the real test is performance, and it is too early to judge that."[183]

It is evident from this last remark that Friedman had been left with a favorable impression by some of Miller's statements since his nomination—perhaps those in which Miller had indicated that the Federal Reserve could not permanently reduce nominal interest rates or the unemployment rate through money creation.[184] Also likely to have struck Friedman favorably was the fact that Miller made remarks about the need for sustained monetary restraint in pursuit of the goal of price stability. In taking this position, Miller mirrored Burns, of whom Friedman had said (*St. Louis Globe-Democrat*, December 7, 1977): "Burns' statements are excellent."[185]

As indicated above, however, Miller's statements prior to joining the Federal Reserve indicated that he was also well-disposed toward cost-push views of inflation. Furthermore, Miller's statements as Federal Reserve Chairman would make clear that he continued to hold a nonmonetary view of inflation.[186] One statement by Miller, in July 1978, that "monetary policy cannot do the job alone," would particularly draw Friedman's ire: Friedman was still quoting it in the 1980s.[187] That this statement would have been anathema to Friedman was certain; but the statement amounted, in essence, to a repeat of remarks Miller had made at his January 1978 confirmation hearings and his March 1978 first Congressional testimony as Chairman (both quoted above). Friedman may have largely overlooked these early statements and may have worked on the presumption that Miller's views concerning inflation and monetary policy were

---

[183] *Newsweek*, May 29, 1978. As these remarks were presented by *Newsweek* as part of a joint question-and-answer session with Paul Samuelson for the magazine, they may have been given when both the economist-columnists were in Washington, D.C., for the Federal Reserve Board consultants' meeting held, as noted above, on May 11, 1978.
[184] On monetary growth and unemployment, for example, Miller had testified on March 9, 1978 (the day after his swearing-in) that "[m]acroeconomic policies will not be able to produce the reduced level of unemployment that all of us seek as a national goal without unleashing a degree of inflation that would be self-defeating. In fact, we could unleash inflationary forces that would bring us right back to high unemployment. So I think you are absolutely correct in saying that if we rely upon macroeconomic policies, we are going to have enormous difficulties and perhaps not achieve our unemployment goal." He was responding to a question that referred to a stated administration goal of a rate of 4 to 4.4 percent unemployment by 1983. (Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives, 1978b, pp. 118–119.) Miller's warnings against the dangers of holding nominal interest rates down included page 153 of the same testimony and his remarks of June 29, 1978, in Joint Economic Committee (1978a, pp. 126–127).
[185] For example, Burns had said (*Family Weekly*, July 3, 1977): "Too often in the past we have lacked the courage to stay long enough on a monetary and fiscal path that will lead to noninflationary economic growth. We cannot afford to backslide once again." Even when making this admonition, however, Burns did not suggest that removing inflation would require a period of recession or slow growth, as Burns envisioned the appropriate policies as "sustaining the expansion now in progress" and, indeed, "significantly reducing the high level of unemployment."
[186] On this matter, as well as the items noted here, see Romer and Romer (2002b, pp. 31–32) and Nelson (2005).
[187] See *Newsweek*, May 2, 1983, and Friedman (1984a, p. 55).

close to his own. But Miller's subsequent affirmation as Federal Reserve Chairman of a nonmonetary perspective toward inflation would have led Friedman to abandon that presumption. In September 1978, Friedman complained that in the face of rising inflation, "discussion about appropriate policy tends to concentrate either on income policies or fiscal policy."[188]

Another area of disappointment for Friedman was that of monetary policy operation. At the time when Miller was nominated, Friedman said that Miller's first act, once confirmed, should be to establish a committee to investigate Federal Reserve operating procedures, with a view to a major reform: "its techniques for controlling money creation are obsolete" (*New York Times*, December 30, 1977, p. D3). Several months into Miller's tenure, Friedman still hoped that Miller's background in the business world might incline him to be innovative with regard to monetary policy procedures—and in particular to initiate a move from reliance on a federal funds rate instrument to the use of a bank-reserves instrument (*Newsweek*, July 24, 1978). The Miller FOMC, however, retained the federal funds rate as its operating instrument.

A "long-range program"

In 1977 and 1978, Friedman saw another example having been recorded of a pattern he had observed on several previous occasions since 1962: the United States abandoning demand restraint. Against this backdrop, Friedman laid increased stress on the need for a multi-year program of disinflation. In an April 1977 television appearance, for example, he stated: "I think the most effective cure for inflation is a slow, steady attempt to bring it down over a period of four or five years."[189] Around the same time, he noted the advantages of "a steady course on the path of government which can be known in advance by people in the marketplace" (*Saturday Evening Post*, May/June 1977, p. 16).

A year later, Friedman gave a specific version of this proposal: a *Newsweek* column (of April 24, 1978) called for steps down in M2 growth each year, accompanied by restrictions on federal government spending that would limit the adjustment to the monetary restriction required of the private sector.[190]

---

[188] Friedman (1978c, p. R–185).
[189] *MacNeil/Lehrer Report*, PBS, April 18, 1977 (*American Banker*, April 21, 1977, p. 6).
[190] Similarly, in a speech given in Scotland a few days after the *Newsweek* article appeared, Friedman (1978e, p. 7) observed: "What is needed is for the authorities to announce long in advance, and by that I mean years in advance, what is going to be the course of the monetary aggregates…"

On May 9, 1978, Chairman Miller replied to a request by Representative Dawson Mathis (D–GA) to react. Miller wrote: "In the last section of his article Dr. Friedman asserts that 'We need a long-term program dedicated to eliminating inflation.' I agree wholeheartedly."[191]

This was true, in general terms: in the previous month, for example, Miller had observed that a "high priority should be the implementation of a strong anti-inflation program."[192] The difference was great with Friedman on specifics, however. This was brought out by Miller's next observation, "Monetary policy has a critical role to play, but it cannot alone bear the whole burden of combating inflation."

In an interview a couple of months later (*U.S. News and World Report*, August 7, 1978), Miller reiterated and elaborated on his opposition to Friedman's proposed long-range plan. Miller argued that the "Federal Reserve is limited in what it can do about inflation" (p. 18) and cited factors that he thought were introducing more inflation, including a Social Security tax increase legislated for January 1, 1979, which "gets right into prices and is very inflationary" (p. 19). Miller said of Friedman's plan (p. 19): "I don't think it would work. It's a nice, neat way to set the dial and go home, but I don't think the world is made up that way. I don't think that's the way monetary policy works." Rather, "monetary policy has to take account of oil boycotts and wheat deals and famines and wage settlements."

Miller added in this interview, "What Dr. Friedman suggests is in a sense workable, but I think the volatility of interest rates and the impact on the real economy would be so disruptive as to be counterproductive." Friedman's *Newsweek* column proposal, however, had aimed to reduce the impact on the real economy of disinflation by reducing monetary growth in stages—by 1 percentage point per year—as well as by limiting the burden of adjustment on the private sector through restraint on federal spending. And as it happened, however, the monetary growth rate for 1978 for M2 that Friedman had recommended in his column—8 percent—was not very

---

Such gradualist programs, of course, had been made by Friedman in some form for years. Stanley Fischer—who, as Section I discussed, participated in Friedman's money workshop for several years starting in 1969/1970—observed (Fischer, 1981, p. 35): "Advocates of gradualism have argued since 1970 that the best way out of inflation is for the growth rate of the money stock to be reduced over a period of four to five years to the noninflationary range of 3 to 4 percent." (Fischer added that there had since been "Fed acceptance of the argument." As indicated presently, however, the Federal Reserve's leadership, although it was agreeable to the notion of a gradual slowdown in monetary growth, did not endorse convergence to a completely noninflationary rate of the kind associated with M2 growth of about 4 percent.)

[191] *Congressional Record*, July 18, 1978, p. 21530.

[192] *Chicago Tribune*, April 2, 1978*b* (Section 2, p. 8).

different from the actual M2 growth generated for the year under Miller.

However, Friedman's proposal had featured a continuing downward path for monetary growth from 1978 to 1982, and the endpoint of this proposed path had drawn criticism from Miller in his May rebuttal. In that letter, Miller argued that "the 4 percent rate of growth in M2 that Dr. Friedman sets as a goal for 1982 would be the lowest rate of growth in that aggregate since 1960, except for the 'credit crunch' year of 1969."[193] The comparison with 1969 was not entirely appropriate, because 1969's 4 percent monetary growth rate had been attained suddenly, rather than as part of a multi-year, phased reduction. A 4 percent growth rate acquired in a gradualist manner could be expected to involve less of a crunch than a sudden shift to that rate.

The fact that Miller objected even to a gradual achievement of this 4 percent rate suggests a possible parting of company with Friedman on the appropriate definition of price stability. Friedman and the Federal Reserve probably did not differ too much in their assessments of longer-term M2 velocity behavior. It was widely accepted that M2 velocity had been roughly trendless since the late 1950s at least through the mid-1970s (see the discussion in Section II above), though there was some doubt about whether this was the case in the most recent years.[194] If Miller took potential output growth to be about 3.5 percent, and this assumption is combined with a constant or gently rising longer-run pattern for M2 velocity, Miller's objection to 4 percent M2 growth might have reflected a judgment that the appropriate longer-run inflation objective was about 2 percent rather than around zero. Such a judgment would be consistent with Romer and Romer's (2002) position that the Federal Reserve's (and U.S. government's) economic objectives have not changed appreciably over the decades.

Friedman's ultimate target of 4 percent monetary growth, in contrast, reflected his preference for roughly zero inflation. Evidently, Miller opposed a goal of a monetary growth rate consistent with zero inflation, even if that rate was approached gradually—perhaps because he believed that a 1 or 2 percent inflation rate was more conducive to orderly relative-price adjustment and so to macroeconomic stability.[195]

---

[193] Miller letter of May 9, 1978, in *Congressional Record*, July 18, 1978, p. 21530.
[194] As noted above, however, it is likely that both Friedman and the Federal Reserve viewed the M2 concept that was likely to have a stable velocity in the future as being the prospective redefined, and broader, M2 series, rather than the existing reported M2 series.
[195] If this was the basis for the rejection of a zero inflation target, it was in keeping with arguments in Tobin (1972) and that Friedman had considered in Friedman (1958, p. 252; p. 182 of 1969 reprint) (and expressed sympathy with at some earlier point: see Rees, 1970, p. 237), although he felt that other considerations outweighed this argument.

Friedman was invited by Congressman Mathis to write a rejoinder to Miller's letter. In this riposte, dated June 8, Friedman remarked that he "had hoped that a new chairman who as a businessman has had to face facts and correct error" might involve a more open-minded response

to criticism, but that he did not see evidence of this in Miller's letter. "Unfortunately, Chairman Miller's comments on my proposal for an announced five-year policy of monetary deceleration are strictly in the Federal Reserve tradition of blandly dismissing all criticism by undocumented assertion." Friedman argued that Miller's rejection of rules-based policy came despite the "highly defective" historical record produced under a U.S. monetary policy not based on rules. "I need not repeat the litany of failure documented fully in Anna Schwartz's and my *Monetary History of the United States, 1867–1960,* nor remind you of the Federal Reserve's contribution to both inflation and recession in the period since that covered in our book—including the credit crunch of 1969 that Chairman Miller refers to[,] as well as that of 1966."[196]

The blame-game and Miller

The choice, discussed above, between zero and 2 percent inflation had become a distinctly hypothetical one in the late 1970s. Inflationary pressures were again becoming severe, and the inflation rate shot up in 1978 (Table 2).

---

[196] From Friedman's letter of June 8, 1978, in *Congressional Record*, July 18, 1978, p. 21530.

Policymakers were caught off-guard by this development. Secretary of the Treasury Blumenthal had said in the summer of 1977 (*American Banker*, August 2, 1977): "We have a little too much inflation… Inflation is now coming down gradually." And in remarks in March 1978, President Carter gave the inflation rate for the second half of 1977 as 4 to 4.5 percent, assessed the current underlying inflation rate as 6 to 6.5 percent, and reaffirmed his goal as getting inflation materially below 5 percent (Carter, 1978). Speaking in August (by which time inflation had risen substantially), Carter said (*Business Week*, August 21, 1978, p. 100) that "it has been running up at a rapid rate caused by unanticipated food price increases" but suggested that "the inflation rate curve [will] top out at the end of this year and then perhaps start to go down." In the same vein, Chairman Miller stated at roughly the same time (*Iron Age*, August 21, 1978, p. 20) that "both the consumer price index and the GNP implicit deflator should show some improvement in the second half of the year." Instead, both deteriorated (see Table 2 for the modern data), and both series would not peak until 1980.

The poor inflation record in 1978 and 1979, and Miller's departure in 1979 from the Federal Reserve for the U.S. Treasury—at a time of adverse sentiment about the economy in financial markets and the U.S. community—would permanently damage his reputation. Miller was also vulnerable to a loss of standing because he came to the Chairman position lacking deep Congressional support. In contrast, Burns was held in high regard by Republican members of Congress—*Newsweek* (January 9, 1978*b*) had observed that Carter had "sacked a conservative icon" by not reappointing Burns—and by many Democrats. Burns' champions saw him as vigilant against inflation, with a letter titled "Why Burns Should Stay" by Senators John Sparkman (D−AL) and Jacob Javits (R−NY) pointing to low longer-term interest rates as a demonstration of Burns' success in containing inflation expectations (*Wall Street Journal*, December 22, 1977). In contrast, as we have seen, Friedman thought Burns had stirred up a surge in inflation, and Friedman's 1978 criticism of G. William Miller amounted essentially to the position that the new chairman was not making a daring break from the Burns regime.

By the mid-1980s, with Paul Volcker having made a success of the job of Federal Reserve Chairman, the negative verdict on Miller was so entrenched that even a labor-economics textbook included a problem-question that gave a 1979 quotation from Burns and asked the reader to try to make a "coherent statement" of the logic behind "Miller's assertion" (Ehrenberg and Smith, 1985, p. 331).

Although Miller was destined to be blamed for making inflation worse and not responding effectively to it, neither the stance of monetary policy during his tenure, nor the direction in which he took FOMC decisions, really justifies this verdict.

First, with regard to the overall stance of monetary policy under Miller: Although writers on monetary policy often follow Friedman in taking inflation in year t as largely determined by events in years $t-1$ and earlier, it seems that this practice becomes rarer when it comes to discussing the behavior of inflation under Chairman Miller. Very often, the fact that inflation was high and rising under Miller is taken as evidence that *Miller*'s monetary policy was inflationary (examples include DeLong, 1997, pp. 271–272, and Levin and Taylor, 2013, p. 238).

An alternative interpretation is, however, available and is consistent with Friedman's commentaries. Under this interpretation, the second peak of inflation in the 1970s reflected the aftereffects of the easy monetary policy of 1976 and 1977. Indeed, as documented in Section II, the surge in inflation that occurred from 1977 onward was predicted successfully by Friedman on the basis of data up to 1977. On this interpretation, the inflation behavior from 1978 to 1980 was largely set in place by monetary developments before 1978, and so it cannot be viewed as indicative of an easy monetary policy stance in those years.

Second, on the direction in which monetary policy went under Miller: The fact that monetary policy tightened under Chairman Volcker is sometimes taken as having the corollary that it did *not* tighten under Miller (see, for example, Goldfeld, 1990, p. 200, and Rotemberg, 2013). In fact, as will now be discussed, monetary policy *did* tighten notably under Miller.

The Miller tightening

That monetary policy tightened appreciably under Miller was stressed by Friedman at the time, but not often by later analysts (exceptions include Romer and Romer, 1989, 1990, and Nelson, 2005). However, M2 growth visibly fell in 1978—see Table 1 above—and, in later years, Miller would emphasize his success in hitting M2 targets and the fact that most of his tenure witnessed a firming of policy (see Biven, 2002, p. 143). Furthermore, the federal funds rate rose over his period in office, and the real short-term interest rate was positive for a considerable part of his tenure (see Figure 3). In addition, narrative evidence of a Miller tightening underlay the

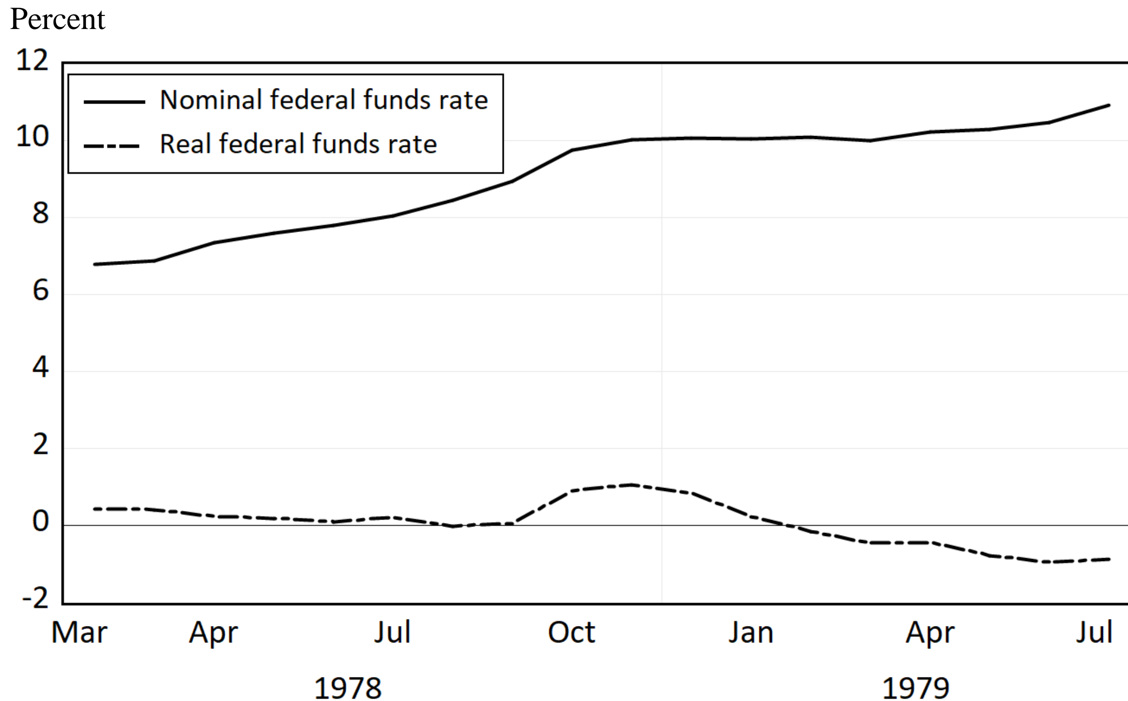

Figure 3. Nominal and real federal funds rate, March 1978 to August 1979.
Source: Federal Reserve Bank of St. Louis' FRED portal. The 12-month CPI inflation rate is subtracted from the nominal federal funds rate to obtain the real rate.

inclusion in the "Romer dates" of an FOMC tightening episode in August 1978 (see Romer and Romer, 1989, p. 136; 1990, p. 161).

The weight of the evidence therefore suggests that monetary policy moved decidedly toward tightening under Miller. This may seem discordant with the fact that Miller's views on monetary policy and inflation were quite similar to Burns'. As Miller, like Burns, doubted that inflation would respond to a negative output gap and he emphasized nonmonetary influences on inflation, he would seem *a priori* unlikely to undertake a monetary policy tightening. But he did so. Why?

One explanation—that Miller tightened under pressure from the administration—can be ruled out. DeLong (1997) highlighted Miller's tenure as one in which the administration urged the Federal Reserve to adopt a tighter monetary policy. But such a situation describes only a fleeting period during 1979 when the administration and Miller disagreed about the timing of monetary policy firming (see Chapter 9).

During the Federal Reserve's tightening in 1978, in contrast, the administration spoke out against tightening. For example, President Carter stated in an August interview (*Business Week*, August 21, 1978, p. 102): "The Federal Reserve Board doesn't consult with me before it takes any action. I deplore the rapid increases in interest rates that have occurred this year... My hope is that for the rest of this year we will not have any additional increase in interest rates. So whatever the Board can do to prevent increases in short-term rates would certainly be constructive." The Federal Reserve raised the federal funds rate further shortly after Carter made this statement.[197]

As for Friedman, his reckoning of monetary policy stressed the political environment as a factor shaping overall monetary policy stance—but not specific administration pressures to loosen monetary policy. He held the Federal Reserve, not Carter, responsible for monetary policy, though he faulted Carter for espousing a nonmonetary account of inflation's sources.

An unforced error on Miller's part that contributed both to the lasting perception that he was both an ineffective Chairman and inclined to loosen policy occurred when, at a meeting on June 30, 1978, of the Federal Reserve Board, he not only voted against a discount-rate increase but was also defeated by other Board governors in the vote (*Wall Street Journal*, July 21, 1978). Paul Volcker—being Federal Reserve Bank of New York president rather than a Board governor at the time—was not a participant in the Board vote but was disconcerted by it: "he got outvoted at one point; and I don't think he realized the symbolic, or whatever, significance of that. You know, people thought he wasn't very important because [they judged that] you got outvoted and therefore didn't have much influence. I think he made a mistake in the way he handled that, but I think the criticism—it wasn't so much criticism, but the [overall] feeling—that he was a weak chairman was a little bit unfair." (Paul Volcker, interview, October 16, 2013.)

This episode contributed to what the *Financial Times* (August 3, 1978) reported as "questions… raised about Mr. Miller's judgment," due to his "appearing to take a softer line on… the outlook for interest rates than much of Wall Street believes desirable." It deserves underscoring, however, that the FOMC under Miller *did* raise the federal funds rate, both before and after this discount-rate vote.[198] Notwithstanding that reality, retellings or inaccurate recollections of the

[197] This produced the *Washington Post* headline "Fed Moves To Raise Funds Rate" (August 29, 1978).
[198] Indeed, in midyear a commentary had observed that Miller "has overseen a sharp tightening of short-term interest rates" (*Kansas City Star* (Missouri), June 21, 1978), and *Time* magazine's cover, titled "The Inflation Fighter: Federal Reserve Chairman G. William Miller," for its July 17 edition, portrayed Miller as a gunfighter entering a saloon.

discount-rate-vote episode likely contributed to the post-1979 misconceptions that Miller either loosened monetary policy during his tenure or that he suffered defeats in FOMC votes as chairman.[199]

The main reasons for the Federal Reserve tightening in 1978, notwithstanding its nonmonetary view of inflation and administration pressure not to tighten, are likely twofold. First, although voicing skepticism that economic slack (excess *supply*) could *reduce* inflationary pressure, Miller, like Burns before him, did accept that excess *demand* could *add* to inflationary pressure, and so he was anxious to tighten by an amount that prevented output from overshooting its potential value: "we are up to a capacity point where I am worried," he remarked in August (*Iron Age*, August 21, 1978, p. 20). Earlier in the summer, he explained that, as he saw it, the emergence of excess demand would superimpose new inflationary forces upon those already present from the cost side, so that "we are at a point where we must be very careful not to trigger demand-pull inflation along with our present cost-push inflation."[200] With the perception that the gap was closing, the warranted rate of both real and nominal income growth declined, so Miller concurred—notwithstanding his opposition to an explicit multi-year proposal of the kind Friedman had laid down—that "[w]e need to set the general target of squeezing down the monetary aggregates" (*Iron Age*, August 21, 1978, p. 20).

A second key factor that made the Federal Reserve well disposed toward policy tightening in 1978 was the depreciation of the U.S. dollar exchange rate, discussed in the next chapter. Though the FOMC's tightening on this occasion was partly based on a rationale that Friedman deplored (that is, import-price-push views of inflation), it helped produce policy settings he preferred (that is, a further move away from the second monetary explosion of 1976−1977).

The tightening of monetary policy during 1978 was not a drastic squeeze: as *Citibank Monthly Economic Letter* observed (November 1978, p. 3): "We haven't yet had the sort of credit squeeze that pushes interest rates far above their usual relationship to inflation." But it was a material firming, and Friedman recognized, and stressed, the fact that monetary policy had tightened during 1978 under Miller. Indeed, as will be discussed in Chapter 9, by early 1979 Friedman was worried that Miller may have already tightened too much.

---

[199] Miller explained his vote as reflecting a view that the discount-rate increase was excessive in relation to the increases in market interest rates that the FOMC had so far generated: see Miller's testimony of July 28, 1978, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1978a, p. 37).
[200] From Miller's testimony of July 28, 1978, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1978a, p. 60).

FRANCO MODIGLIANI

The beginning of this chapter discussed how Friedman began his time living in California with a three-month spell as a scholar-in-residence at the Federal Reserve Bank of San Francisco. One of the key events that the San Francisco bank convened during this stay was a debate on the evening of January 26, 1977, between Friedman and Franco Modigliani.[201]

The bank's research director at the time, Michael Keran, recalled of the event: "We organized that. I was the moderator, if you will; those two people needed one… We had to hire a large conference room outside the Fed [building] to handle all the people who wanted to come to hear it." (Michael Keran, interview, March 7, 2013).

Modigliani had recently completed a year as president of the American Economic Association and, the previous September, had delivered his presidential address at the association's annual meeting. That address (Modigliani, 1977), which has been discussed at various points earlier in this book, had been notable for a containing an acknowledgment—at the time, almost alone among major Keynesians born before 1930—of the likely validity of the Friedman-Phelps critique of the Phillips curve. In this connection, Modigliani (1977) was the first in the list of references that McCallum (1982, pp. 7−8) gave when documenting the point that "a number of influential researchers in the Keynesian tradition have in recent years expressed agreement with the NRH [natural rate hypothesis]."[202]

Indeed, of the four major university-based Keynesians against whom Friedman was often pitted—Modigliani, Samuelson, Solow, and Tobin—Modigliani was the one who gave the earliest signs of acceptance of the natural rate hypothesis. His address was given in 1976, while Tobin and Samuelson did not provide their own endorsements of the hypothesis until 1978−1980, and Solow remained a skeptic.[203] Because of this and other material in the

---

[201] See Friedman (1977d) and Friedman and Modigliani (1977). (For the specific date of the event, see *Oakland Tribune* (California), January 27, 1977.) Dimand (2018, p. 10) incorrectly implies that the Friedman/Modigliani January 1977 event was not examined in the research literature on Friedman until 2016. In fact, however, Nelson (2007)—which appears to be, by a considerable margin, the most-cited research article specifically about Friedman to appear since his death—not only discussed this event but also updated the empirical evidence that Friedman offered in his exchange with Modigliani. Subsequent pre-2016 discussions of the Friedman-Modigliani event include Nelson and Schwartz (2008) and Nelson (2008, 2009); earlier, it was cited in Mayer's (1998) analysis of aspects of the Keynesian/monetarist debate.

[202] In addition, although Modigliani (1977) was mostly critical of the rational expectations literature, McCallum (1979a, p. 66) perceived in the address an acknowledgment of the Lucas (1976b) critique.

[203] See Nelson (2020b, Chapter 13) and the discussion earlier in the present chapter.

Modigliani presidential address, Friedman was able to cite it, in a paper he wrote for the September 1978 Mont Pelerin Society meeting, as a demonstration of the ground that Keynesians were giving to his position.[204]

However, Modigliani's acceptance of the natural rate hypothesis was highly qualified. In contrast to subscribers to the Friedman-Phelps Phillips curve, Modigliani seemed very enamored of the position, prevalent both in policy circles and among Keynesian economists, that the response of the output gap to economic slack had become negligible. In 1975, for example, he stated: "There is little evidence that increasing unemployment to 9 percent from 6 percent gives anything in the way of reducing inflation." He also stated that measures that raised the unemployment rate in the short run constituted an "unacceptable" way to fight inflation (*Kansas City Star* (Missouri), February 25, 1975).

That is, like Arthur Okun—another Keynesian economist who had sometimes been portrayed as a convert to accelerationist or natural-rate ideas—Modigliani seemed to believe that *if* a Phillips curve still described inflation dynamics, that Phillips curve was of the Friedman-Phelps kind; but that, most likely, a Phillips-curve relationship, in the sense of a responsiveness of inflation to the output gap, did not actually hold until full employment was reached.[205] Similarly, like Okun, Modigliani attributed inflation in the 1970s largely to cost-push causes. For example, Modigliani (1977, p. 7) contended that inflation after 1973 "was driven primarily by an exogenous price shock rather than by excess demand."[206] And he voiced support for a variant of Okun's idea of a tax-based incomes policy to fight inflation.[207]

Most of the cost-push aspects of Modigliani's ideas were, however, absent, from Modigliani's presidential address. The address instead focused on revisiting the Keynesian/monetarist debate on policy rules in light of the experience of the United States in the first half of the 1970s. The January 1977 event in San Francisco consisted of a re-presentation by Modigliani of this presidential address, followed by Friedman as a discussant, with a back-and-forth exchange between them completing the session.

---

[204] Friedman (1978c, p. R–183).
[205] On Okun's views, see Chapter 4 above.
[206] In this vein, Modigliani held (in Friedman and Modigliani, 1977, p. 21) that "anybody who looks at the evidence must conclude that what happened in 1974 is primarily an explosion of prices, due to the impact of food and oil."
[207] See Okun and Perry (1978, p. 282).

The January 1977 debate

"I was prepared to meet him," Modigliani recalled in August 1982 of his debate with Friedman, adding that he went into the debate aware that Friedman was "tough and very fast and dangerous" (quoted in Klamer, 1984, p. 120). Furthermore, by the mid-1970s Modigliani regretted the time and effort he had put into the "AM/FM" debates in the 1960s (Charles Steindel, personal communication, September 9, 2015).[208]

These debates had evidently not led to the clear-cut and widely-acknowledged victory over Friedman that Modigliani had hoped for.[209] Nor, for that matter, had Modigliani's (1964b) critique of Friedman's view on rules; despite being published in the *Journal of Political Economy*, this article had neither generated a written exchange with Friedman nor prevented increased interest in the constant-monetary-growth rule. Instead, what prevailed by 1977—as Modigliani put it on July 30 that year—was that economists were living in "these days of rampant monetarism."[210]

Modigliani's (1977) address contained an extensive critique of the constant-monetary-growth rule, not only on grounds of principle but also via the deployment of what Modigliani argued was empirical evidence that the rule did not perform well in the United States. Like many Keynesians of the time, Modigliani perceived a greater conversion by U.S. policymakers (before 1979) to Friedman's prescriptions than had actually occurred. But Modigliani (1977, p. 11) went further in this direction by implying that the constant-monetary-growth rule had been instituted informally under Arthur Burns. Modigliani held that U.S. monetary growth had been stable from 1971 to 1974. He contended that this had resulted in outcomes inconsistent with monetarists' predictions: the stability of monetary growth in the 1970s had been associated with sizable

[208] Charles Steindel was a graduate student at MIT in 1973−1977 (Charles Steindel, interview, December 3, 2015), and Modigliani was his coauthor (see Modigliani and Steindel, 1977) and thesis advisor. Steindel discussed the AM/FM (Ando-Modigliani versus Friedman-Meiselman) debate with Modigliani after coming across the debate during his graduate-student years. On that debate, see Nelson (2020b, Chapter 12).

[209] Modigliani had begun work on the critique that evolved into Modigliani and Ando (1965) in the 1960/1961 in response to an early version of the Friedman Meiselman study. Niels Thygesen, who collaborated with Ando and Modigliani during this early stage of their development of a rebuttal, recalled: "Ando and Modigliani were clearly upset by the work of Friedman and Meiselman. They thought it was much oversimplified—which it was, of course, in a sense—[and] very provocative. And yet, they were very respectful, clearly, of the way Friedman proceeded. And I remember statements—Modigliani saying, 'If we write something about this paper, we have to keep it absolutely watertight, because otherwise, Milton will tear us apart afterwards.' So there was a mixture of great respect for him, but also irritation that he was simplifying things too much." (Niels Thygesen, interview, February 10, 2015.)

[210] From the remarks published as Modigliani (1979, p. 330).

swings in aggregate output. The same was true of another period of stable monetary growth that Modigliani cited: that from 1953 to 1957 (see Modigliani, 1977, pp. 11–12).

In the comment on Modigliani (1977) that he delivered during the January 1977 debate, Friedman stressed that monetary growth had not been stable in the 1971–1974 period when judged by his preferred aggregate, M2.[211] Modigliani's demonstration had used M1.[212] On this basis, he challenged Friedman at the Federal Reserve Bank of San Francisco event, with reference to 1971–1974: "I defy you to find any other period in which, for a period of that length, you get that low level of variation."[213]

After consulting the data, Friedman did just that. Whether judged by M1 or M2, monetary growth had been more stable in the early- to mid-1960s—when the economy displayed considerable stability—than in 1971–1974. Modigliani conceded this point.

A second concession from Modigliani during the seminar was his acknowledgment that Friedman had not—as Modigliani had claimed in his presidential address—rested his natural-rate-hypothesis exposition in 1968 on the assumption of competitive and atomistic labor and goods markets.[214]

Notwithstanding his concessions of these two points in the course of his exchange with Friedman, Modigliani maintained the two original claims in the published version of his presidential address, printed in the *American Economic Review* in March.

Perhaps Friedman should have rebutted the point regarding monetary variability earlier. For

---

[211] See Friedman (1977d, pp. 15–16). For 1953–1957, Friedman applied the same argument, combined with the point that the start of the FOMC's bills-only policy in 1953 had meant that the effective money supply was more variable over that period than was the measured money stock.
[212] Friedman had himself noted that the level of M1, and to a lesser extent that of M2, had from 1971 through early 1974 displayed a tendency to return to a particular trend line (Instructional Dynamics Economics Cassette Tape 144, April 17, 1974; Instructional Dynamics Economics Cassette Tape 147, May 30, 1974). However, in considering this period, he also stressed (both at the time and subsequently) that there were considerable—and, as he saw it, unnecessary—fluctuations in monetary growth within each year.
[213] From Modigliani's remark in Friedman and Modigliani (1977, p. 20).
[214] For Modigliani's acknowledgment that Friedman did not base his 1967 presidential address on perfect competition, see Friedman and Modigliani (1977, p. 19). (Modigliani went on to argue that because agents respond to price signals in Friedman's model, it was *de facto* a perfect competition model; but see Chapter 8 of Nelson, 2020a, as well as Chapter 2 above, for critical analysis and refutation of this argument.) For Modigliani's acknowledgment that the early to middle 1960s provided a counterexample to his position that the 1970s (and 1950s) provided the most-stable periods of monetary growth, see the footnote written by Modigliani that appeared in Friedman (1977d, p. 16), as well as Modigliani (1986, p. 37).

prominent Keynesians had been pointing to the years to 1974 as one of stable monetary growth in critiques appearing publicly as early as mid-1975—as part of what were described as "the Okun-Modligiani charges" against monetarism (*New York Times*, July 14, 1975). On that occasion, Friedman had been quoted saying of Modigliani and Okun's policy prescriptions, "They've talked that way year after year and they are wrong." He added, "The worst thing in the world that the Fed could do is to follow their advice and run a policy geared to holding down interest rates…. Those guys [Okun and Modigliani] are fine-tuners. If the Fed adopted my kind of policies, they would be out of business." But it was instead Friedman's former student Beryl Sprinkel who was quoted replying to the specific allegation that the first half of the 1970s had seen stable monetary growth—an allegation to which Sprinkel responded: "There is no way to interpret the 1969 to mid-1974 period as one of stable monetary growth." (*New York Times*, July 14, 1975, p. 39.)

In the event, as we have seen, Modigliani pressed ahead with this interpretation, though in January 1977 he would concede that the 1960s did provide an example of a more stable monetary-growth pattern than that seen in the years to 1974.

Just as the January 1977 debate saw Modigliani voice more concessions to Friedman than those he actually made in print, at that event he also qualified his criticisms of the constant-monetary-growth rule. "One of Modigliani's points," Keran recalled, "was that Friedman's [constant-monetary-growth rule] approach would have been great if he were in Italy; but that, here in the United States, it's too crude a thing to work; that, if you have a lot of inflation and a lot of disorganization in the markets, the monetarist approach might work well, but not in the subtle environment of the U.S. economy... I remember that comment quite strikingly." (Michael Keran, interview, March 7, 2013.) "Unlike Milton, I happen to think there are some things the [U.S.] government can do very well," Modigliani observed eighteen months after the January 1977 debate (*Wall Street Journal*, July 17, 1978, p. 27).

With regard to that debate, Keran judged that Friedman was the winner on the day. "In terms of Modigliani, I can still see the flash in his eye when he wanted to counter a point that Milton made. So he had a lot of passion. Milton was very analytical and calm, cool, and collected. And so, I think—I might be biased on this, but that was my impression—that Milton came across stronger." (Michael Keran, interview, March 7, 2013.) However, Modigliani was satisfied with his own performance: "I think that I did fine" (Klamer, 1984, p. 120).

Debating resource slack and stabilization policy

In the afternoon ahead of their evening debate, Friedman and Modigliani met the local media to discuss the national economic situation (*Oakland Tribune* (California), January 27, 1977). This appearance revealed disagreement about the current policy prescription. Friedman had already recommended to the authorities that they "[l]et the recovery proceed… at a moderate pace" (*Newsweek*, December 6, 1976) and exercise fiscal and monetary restraint, rather than increase stimulus. Indeed, as discussed in Sections I and II above, in the late-1976/early-1977 period he had already concluded that policy settings were already too loose, and that the stance of monetary policy was promoting a resurgence of inflation.

Modigliani, in contrast, recommended stimulus. His recommendation, it is true, was tempered by an upgraded estimate of the full-employment unemployment rate. He had already granted in his presidential address that more-generous unemployment benefits had raised the baseline unemployment rate.[215] Five years earlier, he noted at the media appearance, his nominated full-employment goal would have corresponded to a rate of 4.5 to 5 percent. "[But] now, I'm around 6 percent. I am responding to the changed composition of the figures." (*Oakland Tribune* (California), January 27, 1977.)

To be more precise: Modigliani's estimate of the full-employment unemployment rate was probably about 5.8 percent. This value can be inferred from the fact that, in the same January 1977 media event, he gave the amount by which current unemployment exceeded that rate as 2 percentage points. Modigliani's assessment of the value of the full-employment unemployment-rate was therefore higher than that being used by the Carter Administration, which accepted the value of 4.9 percent that it had recently inherited from the Ford Administration (see Biven, 2002, p. 202). Modigliani's estimate was also close to the value of around 6 percent that would be judged in retrospect to be the appropriate estimate of the natural rate of unemployment in the late 1970s. But, notwithstanding his fairly realistic estimate, Modigliani recommended an amount of fiscal and monetary expansion that was inappropriate. His recommendation was unintentionally overstimulative because, as already indicated, it rested on then-prevailing estimates of potential economic growth. These estimates suggested, erroneously, that output needed to grow by more than 3.5 percent a year just to make headway into the amount of resource slack.

[215] See Modigliani (1977) and the discussion in Chapter 4 above.

Friedman, in contrast, cast doubt on the 2 percent unemployment-gap estimate that Modigliani cited. With regard to unemployment-rate targets, he had already remarked in a November 1976 television appearance that "we are only led down a false trail by trying to believe that, somehow or other, a powerful government can pick a number out of the air—like 3 percent or 4 percent or 5 percent—and produce policies which will lead to this result."[216] Although Friedman regarded the 6 percent rate cited by Modigliani as more realistic, he did not want to center the formulation of economic policy on *any* numerical estimate of the full-employment unemployment rate. He had said in November, "we ought not to regard the [unemployment] numbers which are generated in that way [by the statistical agencies] as calling for massive policies which can do more harm than good."[217] With regard to the amount of resource slack, Friedman stated in the January 1977 media appearance: "I question whether the margin is big enough to make it possible for the government to pour out money without threatening another surge of inflation."[218]

Indeed, as already indicated, by early 1977 Friedman believed at this point that an inflation surge was already in motion. Modigliani told reporters at his joint appearance with Friedman that it was feasible for President Carter to preside over declines in both the inflation rate and the unemployment rate during his presidency. Friedman, in contrast, gave the reporters his estimate of a rate of 7 to 9 percent inflation for the next couple of years (*Oakland Tribune* (California), January 27, 1977). As has been stressed in this chapter, this was a prediction that was vindicated.

Revisiting the 1977 debate

About a decade after their 1977 exchange, Friedman and Modigliani both had occasion to revisit it in print. Modigliani's book *The Debate Over Stabilization Policy*, based on lectures given in 1977, was belatedly published in 1986. The book alluded to the Federal Reserve Bank of San Francisco debate with Friedman, which had taken place not long before the lectures.[219] However, little of Friedman's work since 1970 was mentioned and, like Tobin, Modigliani was now

[218] Around the same time, he expressed objections to "the usual kinds of statements about how there [is] so much slack in the economy… that there was no danger of restimulating inflation" (Instructional Dynamics Economics Cassette Tape 207, January 1977, Part 2).
[219] See Modigliani (1986, p. 37).

concentrating his fire on the rational-expectations critiques of activist stabilization policies, rather than on Friedman's writings.

Modigliani (1986) did, however, indicate (as had Modigliani, 1977) that the monetarist movement had made valid criticisms of the early vintages of Keynesianism. Modigliani had himself long set himself apart from these variants of Keynesianism. Indeed, Friedman had noted in the San Francisco debate in 1977 that "I've always thought that Franco, insofar as you use these terms, has always been a monetarist, in very important ways."[220] Friedman had particularly pointed to Modigliani's (1944) paper, which—at a time when Friedman himself was only beginning to shake off extreme Keynesian views—had relegated instances in which monetary policy was ineffective in altering nominal income to a special case, allowing an important role for the money stock in other circumstances. Of course, once he became a monetarist, Friedman would go further than this and would reject the empirical relevance of the liquidity-trap case.

In his *New Palgrave* dictionary entry on the quantity theory of money, which appeared a decade after Modigliani (1977) was published, Friedman paid Modigliani the compliment of quoting that presidential address—specifically, its observation that there were "no serious analytical disagreements between leading monetarists and leading nonmonetarists."[221] But Friedman immediately added that "there remain important differences on an empirical level." [222] Even this qualification understated the divide between Friedman and Modigliani, however. For one thing, different empirical judgments can imply different analytical frameworks: Modigliani's insistence in 1977 on the prominence of cost-push shocks as drivers of inflation, for example, amounted to a rejection of Friedman's monetary view of inflation. For another, by the 1980s Modigliani was apparently not well disposed toward seeing his differences with Friedman as capable of being resolved empirically, as he claimed that Friedman "has a mission and seems to be willing to sacrifice some intellectual honesty for that" (Klamer, 1984, p. 120). Modigliani did not provide any specifics underlying this claim. His remark may have reflected the disdain that leading Keynesians often had for Friedman's popular writings, which they felt were oversimplified.[223]

Though its final version saw print in 1987, Friedman's *New Palgrave* entry was initially drafted in late 1985. That period also saw the fulfillment of a prediction that he had made concerning

Milton Friedman and Economic Debate in the United States, 1973−2006
Chapter 9: Debates on International Economic Policy, Regulation, and Aggregate Supply, 1977 to 1978

Edward Nelson[1]
Federal Reserve Board
July 30, 2023

I. EVENTS AND ACTIVITIES RELATED TO DEBATES ON INTERNATIONAL ECONOMIC POLICY, REGULATION, AND AGGREGATE SUPPLY, 1977−1978

"Still a good year," was the title of Paul Samuelson's *Newsweek* column for January 9, 1978, in which, in the wake of recent news—including the announced departure of Arthur Burns as head of the Federal Reserve—he reevaluated the United States' economic prospects for the twelve months ahead. Among the features of his projection that confirmed that "it should be a good year for the American economy," Samuelson cited the likelihood there would no recession in 1978 and the prospect that the coming twelve months would, instead, see real output growth at or above its potential rate.[2] Yet the year 1978 would not be remembered as a period of economic success for the United States. Dornbusch and Fischer (1984, p. 556) would classify it as part of the "poor economic performance of the 1969−1983 period," and in mid-2014 Richard Fisher, who had been a senior official in the U.S. Treasury during the Carter years, would look back at the U.S. economy "in 1978, when things were pretty awful."[3]

These adverse retrospectives did not stem from the year's performance on the criteria of real growth and the unemployment rate. On the contrary, by these metrics, the year was one of the best in the decade of the 1970s. Milton Friedman had remarked in late 1977 that, with regard to real economic activity, the "immediate outlook is good" and that it looked like the U.S. economic expansion "should have a year or so to go"—and those assessments, like the similar Samuelson predictions given a couple of months later, were borne out by the subsequent data for

1978.[4] The U.S. unemployment rate in December 1978 was 6 percent, down from 6.4 percent a year earlier, while modern data on U.S. real GDP show a very high 6.7 percent growth in the four quarters to 1978:Q4.

The behavior of productivity growth, it is true, provided a more mixed picture about the country's real economic performance. The four-quarter growth of U.S. labor productivity would turn out to be 2.7 percent in 1978:Q4—in itself, certainly a good outcome. But this followed growth of only 0.7 percent growth in the four quarters to 1977:Q4—an unusually weak reading, by the standards prevailing up to that time, in a year of economic expansion.[5] The cumulative evidence arising from data for 1977 and 1978 put paid to initial optimism regarding the United States' post-1973 productivity growth rate. Initial figures for calendar 1976 had shown 4 percent productivity growth in that year, the best since 1964 (*Daily News* (New York), February 26, 1977). In the wake of such information, William Nordhaus—a member of the Carter Administration's newly assembled Council of Economic Advisers (CEA)—had testified in June 1977: "In general, after correcting for cyclical movements, the economy's productivity grows at a fairly steady rate…" Nordhaus had granted as the "one major exception" to the steady growth a one-time decline in the level of U.S. productivity in 1974, in the immediate wake of the oil embargo.[6] The net effect of national productivity readings in 1977 and 1978 would, however, be to force a reassessment by the CEA of its position that the productivity trend had not changed after 1973—and that reassessment led the Carter Administration in early 1979 to make sharp downward revisions to its estimates of post-1973 U.S. potential output.[7]

The most prominent aspects of national performance casting a pall over 1978's macroeconomic record were, however, to be found instead in the behavior of nominal variables. One of these variables—inflation—has been discussed at length in the previous chapter. U.S. inflation got

[4] The quotations are from Friedman (1977a, p. 23). The occasion was the year's "Stanford/Hoover" conference—held in Los Angeles, which he visited in the first week of November 1977 (*Los Angeles Times*, November 7, 1977).

[5] See "Nonfarm Business Sector: Real Output Per Hour of All Persons, Percent Change From Quarter One Year Ago, Quarterly, Seasonally Adjusted," *https://fred.stlouisfed.org/series/PRS85006151*. Modern vintages of *annual-average* data suggest that labor productivity (output per hour) in the nonfarm business sector rose 2.8 percent in 1975, 3.5 percent in 1976, and 1.5 percent in both 1977 and 1978. See Council of Economic Advisers (2018, Table B−16, p. 551).

[6] From page 98 of Nordhaus' written submission for his testimony of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977a).

[7] For further discussion, see Orphanides (2003) and Chapter 11 below. Nordhaus himself would later find (see his 2004 paper) that labor productivity growth fell from 2.27 percent in 1959−1973 to 1.34 percent in 1973−1995 (p. 27) and that, with regard to the slowdown after 1973, "for a five-year window, the slowdown is largest for the 1978–82 period, centered on 1980" (p. 6).

severely worse during the year. This result, though in keeping with Friedman's public warnings during 1977, was in marked contrast to a January 1978 memorandum to President Carter, written by two of his domestic advisers, that had stated: "We see no sign that inflation is heating up again, or is likely to do so over the next two years."[8] Double-digit inflation—which Samuelson's January column had given only a 1-in-10 chance—was barely avoided in 1978, and Friedman accurately foresaw (*Newsweek*, April 24, 1978) that a recession would occur as policymakers reacted to the breakout (although the recession did not start until 1980—later than he predicted).

Another major source of discontent about economic developments in 1978 was one that likely especially shaped Richard Fisher's impression of that year's events, due to his having been located at the U.S. Treasury: the depreciation of the U.S. dollar nominal exchange rate.

U.S. dollar depreciation

Although Friedman would state on multiple occasions in the mid-1980s that the flight from the U.S. dollar "had begun in 1978," this was not an accurate recollection.[9] The concentrated period of dollar depreciation would come to be regarded as comprising October 1977 through October 1978 (see, for example, Abrams, 1979, p. 21; P. Wonnacott, 1982, pp. 3–4). The period of dollar weakness was actually already underway during summer 1977 (see, for example, Laffer and Miles, 1982, p. 405), before speeding up considerably later in the year—a pattern evident in Figure 1. The summer declines in the exchange rate had led Chairman Burns to state in testimony in late July 1977 that the Federal Reserve was "deeply concerned about the dollar."[10] Indeed, that early decline in the exchange rate was the subject of widespread media commentary and had prompted Friedman to devote a column to the matter at the end of the summer (*Newsweek*, September 5, 1977).

Cumulatively, the U.S. dollar effective exchange rate index fell nearly 14 percent in the eighteen months from April 1977 to October 1978. This depreciation paralleled, albeit on a smaller scale, the nearly 24 percent depreciation that the pound sterling had experienced two years earlier (that

is, in the period April 1975-October 1976).[11] This protracted decline in the U.K. exchange rate, which had eventually led to a Friedman *Newsweek* column (October 11, 1976*a*) on "The Pound Crisis," occurred alongside a major public debate on economic policy in the United Kingdom—one characterized by a high degree of media interest in Friedman.[12] His many appearances during the second half of 1976 on U.K. commercial and state-owned television stations and in its national press were a source of irritation to *Labour Monthly*—a periodical that, despite its name, had little sympathy with the ruling Labour government and was instead in favor of revolutionary socialism. 'In this situation," stated its lead article as 1976 closed (January 1977, p. 3), "it is no wonder that the arch-reactionary American economist, Professor Milton Friedman, should be shooting his mouth off with a maximum of publicity in our press and TV on the dire fate facing Britain...."

[11] An index of the effective nominal exchange rate for the U.K. pound sterling registers a value of 171.99 in April 1975 and of 130.95 in October 1976. Its low value for the decade of the 1970s was recorded in November 1976, at 130.7. See *https://fred.stlouisfed.org/series/NNGBBIS*.
[12] Book-length accounts of this episode, which mainly focused on its fiscal-policy aspects and did not particularly highlight Friedman's role in the public side of the debate, were Burk and Cairncross (1992) and Dell (1991). On Friedman's prominence in the public discussion, see Nelson (2009a, pp. 81–96; 2009b, pp. 490–494).

Friedman's profile was also very high in 1977 and 1978 during the United States' own exchange-rate trauma. A decade previously, *Washington Post* economics writer Hobart Rowen had suggested that, in terms of economics, the year 1967 "seems to have been the year of Milton Friedman" (December 31, 1967). But the year 1977 would prove to make a stronger claim for this label. The very first day of the year would see, unusually, a two-month-old instalment of *Meet the Press* repeated in the Chicago area, in a near-primetime television slot (*Chicago Daily News*, January 1, 1977). This consisted of Friedman's most recent appearance on the program, and its rebroadcast would occur on what was virtually Friedman's last day living in the city of Chicago.[13] And, near the end of the year, another newspaper economics columnist, J.A. Livingston, would observe that "Americans have been Friedmanized" (*Kansas City Star* (Missouri), November 21, 1977).

Livingston, like Rowen a decade earlier, had made his remark in reference to the national attention given to Friedman's emphasis on the role of monetary factors in domestic economic behavior.[14] In particular, Livingston was lamenting the extent to which commentary in the United States regarding the behavior of real economic series was preoccupied with tracing such behavior to movements to the money stock. As it happened, this tendency was more true of the financial world than of policymaking: it is detailed below how the Carter Administration's economic team often seemed to center their analysis of aggregate spending behavior on *fiscal* policy, rather than on monetary policy. In the area of international economic arrangements, however, the notion that the United States had been "Friedmanized" by 1977 had considerable plausibility. Friedman's work on floating rates had been cited by the *New York Times* (October 15, 1976*b*) as his greatest influence on national policy, and the publicity created by the dollar depreciation of 1977 to 1978 underlined the fact that, over the preceding years, international monetary arrangements had moved in a direction that Friedman had pointed toward.

For his part, speaking in April 1978, Friedman contended that the "brute force of events," rather than the analytical case for flexible exchange rates he had laid out twenty-five years earlier, had given rise to the new international monetary arrangements. But he did grant that the theoretical analysis of floating exchange rates had helped establish a climate of opinion in which the floating-rate system could settle in (*The Listener* (London), April 27, 1978, p. 528).

---

[13] In some listings, the replay of the program was given the title *Milton Friedman Meets the Press* (*Register-Star* (Rockford, Illinois), January 1, 1977).
[14] Perhaps inspired by coming across Livingston's column, U.K. financial writer Patrick Sergeant voiced a related observation-cum-complaint about the situation prevailing in his own country, in a column that asked the question: "Is Money Really All That Matters?" (*Daily Mail* (London), November 26, 1977).

Events during 1977 and 1978 in the country in which Friedman made these remarks—the United Kingdom—bore this observation out. The U.K. pound sterling had floated in panicked circumstances in June 1972. But, having caught their breath, the U.K. authorities' considered view was that a float was preferable to the alternatives available. Specifically, in both October 1977 and December 1978, the U.K. government consciously decided to float, or to keep floating, the pound sterling, and their decision was based on the domestic-monetary-control/policy-autonomy arguments that had permeated Friedman's 1953 paper on floating and his subsequent contributions on the subject. The 1977 decision ended several months in which the authorities had tentatively restored a fixed sterling/dollar exchange rate, while the 1978 decision saw the U.K. authorities decline to join the European Economic Community's new exchange-rate mechanism (ERM), under which it was proposed that, within major parts of Western Europe, exchange rates would be fixed.

As an enthusiastic proponent of floating rates, Friedman was, *de facto*, a leading spokesperson for the post-1973 system. Accordingly, although his judgment, as expressed at the September 1978 Mont Pelerin Society meeting in Hong Kong, was that a floating-rate system was "here to stay for the indefinite future," he was also aware of, and sensitive to, doubts about the system and efforts to replace it.[15] The European Economic Community's ERM was one such effort in the direction of curbing the floating-rate system. But the ERM was not due to start until 1979, and it would not involve an attempt to fix rates of exchange against the dollar. In the meantime, during 1977 and 1978, Friedman encountered doubts in his own country about the merits of floating rates. The U.S. dollar's large depreciation gave rise to criticism on the part of the U.S. government and outside commentators of the foreign exchange market's judgments.

In the face of these reactions, Friedman first affirmed the need for a more relaxed attitude toward price movements in the foreign exchange market. In the early stages of the dollar depreciation, he blasted "the exaggerated attention paid by the news media to trivial changes in exchange rate" (*Newsweek*, September 5, 1977). And when, over the course of the subsequent six months, the downward trend in the dollar exchange rate became consolidated, Friedman emphasized the degree to which the move was explicable in terms of fundamental economic behavior, rather than being capricious. In particular, in February 1978 Friedman observed: "The dollar is weak because our inflation rate has been higher, and our anticipated rate of inflation is higher, than the

[15] The quotation is from Friedman (1978c, p. R–181).

inflation rate of Germany, of Switzerland, of Japan."[16] This contrasted notably with Arthur Okun's declaration a couple of weeks earlier that the depreciation "is *not* the result of above-average inflation rates" (*Washington Post*, January 29, 1978; emphasis in original).

As a general proposition, the notion that exchange exchange-rate movements in the floating-rate era could be explained satisfactorily would come under challenge—with Meese and Rogoff (1983) documenting the result that much of the movement observed in the 1970s could not be well accounted for by proposed empirical models. The simplest version of these models—one in which real exchange rates were constant, so that purchasing power parity (PPP) alone drove nominal exchange-rate variations—was one of the first casualties of the floating-rate era. Friedman's former University of Chicago colleague Jacob Frenkel reported at a conference in June 1980: "One of the striking facts concerning the relationship between prices and exchange rates during the 1970s has been the dismal performance of the predictions of the simple versions of the purchasing power parity doctrine."[17]

Friedman was not, however, an adherent to strong versions of PPP. He had consistently taken the position that real shocks struck individual economies and the world and that the real exchange rate needed to adjust in response to these shocks. Furthermore, the fact that real exchange rates varied considerably after 1973—and even the fact that these movements were often hard to trace to fundamental economic driving forces—did not mean that it was not sensible to expect, other things equal, that a higher pace of price rise in one country than abroad should lead to a commensurate depreciation of that country's exchange rate. U.S. inflation over the 1977−1978 period exceeded the rate prevailing in some key trading partners, so several points of the double-digit depreciation in that period could be legitimately attributed to inflation-rate differentials.

As the authorities saw it in a Federal Reserve/U.S. Treasury announcement in early 1978, official action was now required to "check speculation and reestablish order in the foreign exchange markets."[18] Against this background of growing disillusionment in U.S. officialdom about what floating rates were delivering—including what officials considered to be an excessive decline in the dollar—trends emerged during 1977−1978 in U.S. policy developments unfavorable to

[17] Frenkel (1980, p. 145).
[18] Statement of January 4, 1978 (issued by the Board of Governors of the Federal Reserve System and the U.S. Treasury), in Federal Reserve Board (1978, p. 60).

Friedman's position. In particular, these trends heightened the prospect of a move away from, rather than cementation of, a system Friedman favored: that is, one in which leading economies' exchange rates were market-driven, trade and capital accounts were liberalized, and home economies' aggregate demand policy focused on domestic objectives.

In these two years, Friedman critiqued a variety of explicit administration initiatives in the international-economic-policy area that proceeded along a path contrary to his own recommendations. These included the continuation, in President Carter's first year, of the policy of occasional official interventions in the foreign exchange market; the administration's attempts to coordinate aggregate-demand policies across major economies; and a concerted intervention package, the "dollar rescue" of November 1978. In addition, the prospect arose that further measures in international economic policy would be undertaken: direct intervention by the administration in the underlying components of the current and capital accounts of the balance of payments, via increased restrictions on trade and foreign-exchange transactions. These were measures that Friedman feared were around the corner, as they seemed to fit in with the direction in which international economic policy was going.

Friedman's interventions in 1977 and 1978 in the various areas of international economic policy are now elaborated on, together with related issues in international economics that came up during these years.

Foreign exchange intervention

The existing world exchange-rate system "satisfies no one," Friedman stated in September 1978.[19] In his case, the source of dissatisfaction was the fact that the system was not a clean float but, instead, involved official interventions with foreign exchange intervention by the public sectors—interventions that he considered to be the "only thing wrong with the present system" (*Chicago Tribune*, April 2, 1978*a*, p. 8). In particular, with regard to U.S. exchange-rate policy, Friedman observed: "The Federal Reserve Board ought to keep out of the foreign exchange markets completely—and allow the dollar to find its own level." (*Chicago Tribune*, April 2, 1978*a*, p. 8.)[20]

---

[19] Friedman (1978c, p. R−181).
[20] The Federal Reserve Board was only one of the U.S. policy entities involved in these operations. Foreign exchange operations were undertaken by the Federal Reserve Bank of New York, required approval by the Federal Open Market Committee, and in 1978 involved the Exchange Stabilization Fund of the U.S. Treasury (see Federal Reserve Board, 1978, p. 60, and Abrams, 1979, pp. 15−16). As already indicated, the January 1978 announcement

At the start of 1978, Friedman had been invited to testify to Congress on issues concerning exchange rates. Scheduling conflicts led him to decline this offer. But the invitation, received in a letter dated January 13, evidently played a role, along with two Federal Reserve Board press releases that were collected in the January 1978 issue of the *Federal Reserve Bulletin*, in galvanizing Friedman into writing a new *Newsweek* column (January 30, 1978) on foreign-exchange intervention.[21] The first of the Federal Reserve Board releases, already noted, had announced that the Federal Reserve and the U.S. Treasury would from this point on take a more regular role in intervening in the exchange market (Federal Reserve Board, 1978, p. 60), while the second release had reported details on Federal Reserve income for the year 1977 (Federal Reserve Board, 1978, p. 63). This income statement reported "a loss of $146 million in foreign exchange transactions."

Friedman's column noted that official intervention had been justified by the aim to rein in unjustified short-term market moves. Echoing a passage of his 1953 article, Friedman argued how to evaluate the validity of this intervention: "In general, there is a simple test: whether it makes or loses money." (*Newsweek*, January 30, 1978.)[22] In particular, if the authorities purchased dollar assets and sold foreign assets when the U.S. exchange rate was under untoward downward pressure, it should enjoy an augmentation in the value of its foreign-exchange portfolio once the selling pressure had passed. Friedman reported the bottom line by year since 1971 of the Federal Reserve's foreign-exchange record. This showed a loss for each year, culminating in the aforementioned $146 million loss in 1977.[23] Friedman noted that the losses cumulated to $550 million since 1971 and argued that this implied a negative verdict on the

---

of increased exchange-market intervention by the U.S. authorities had been in a joint statement by the Federal Reserve Board and the U.S. Treasury.

[21] Friedman would enclose a copy of the *Newsweek* column, together with an older column and remarks written specifically for the congressional proceedings volume, in his letter of reply to the invitation to testify. See Friedman (1978d).

[22] The passage this echoed was the following: "It would do little harm for a government agency to speculate in the exchange market provided it held to the objective of smoothing out temporary fluctuations and not interfering with fundamental adjustments. And there should be a simple criterion of success—whether the agency makes or loses money." (Friedman, 1953a, p. 188.)

[23] Argy (1994, p. 400) mistakenly suggested that, in making these tallies, Friedman was "drawing heavily" on Dean Taylor's (1982) study. This assertion was incorrect: Friedman was simply using published, official, Federal Reserve figures. Taylor's study first materialized only later (with its working paper circulated as D. Taylor, 1980), and it actually came at Friedman's suggestion. "Milton originally suggested looking at official foreign exchange intervention. He [then] came to a seminar I gave on the topic [when Taylor was visiting the Hoover Institution as a National Fellow around 1979/1980] and gave feedback." (Dean Taylor, personal communication, November 14, 2019.) See also D. Taylor (1982, p. 356).

United States' foreign exchange intervention.[24]

Federal Reserve Board Governor Henry Wallich responded almost immediately, in Congressional testimony of February 6, 1978, at the hearing to which Friedman had been invited but which he had turned down attending. As often occurred in the case of public statements by national central bankers, Wallich's testimony responded to Friedman without mentioning him by name. To the initiated, however, Wallich's reference to Friedman was nevertheless unmistakable: "One test, which has sometimes been proposed, of whether actual intervention operations serve [their intended purpose]… is the degree to which intervention is profitable."[25] Wallich did not strongly dispute the validity of this test—but argued that the Federal Reserve had, in fact, passed it. His basis for this conclusion was the reliance on a narrower measure of Federal Reserve foreign exchange profit and losses than that Friedman had used—one excluding the losses the Federal Reserve had incurred by disposing of investments it had inherited from the Bretton Woods era. It was true that this narrower measure did show profits in each year from 1971 to 1977. However, the same measure went on to show a very sizable loss in 1978, after the Federal Reserve's step-up in intervention that year—making intervention over 1971–1978 loss-making overall, even on this narrower measure (see Abrams, 1979, p. 21).

The debate on Friedman's "simple test" for the validity of foreign-exchange intervention got a further fillip a few years later. Friedman in his 1978 *Newsweek* column had stated that he was not aware of comparable reported figures on profits and losses from exchange interventions by the authorities of the United Kingdom, Japan, and the Federal Republic of Germany. He subsequently suggested an investigation of the record of these countries to a former student of his, Dean Taylor, whose strongly-worded article on the matter appeared in the April 1982 issue of the *Journal of Political Economy*. Dean Taylor's article opened with the relevant quotation from Friedman's 1953 article then immediately stated his own conclusion that central-bank intervention by the central banks of Canada, France, Germany, Italy, Japan, Spain, Switzerland, the United Kingdom, and the United States during the floating-rate era had been "a dismal failure when judged by Friedman's profit criterion."[26] The Taylor piece also alleged a lack of transparency in reporting intervention data on the part of several central banks, with the article containing caustic remarks about the difficulties he had encountered in gleaning the relevant

[24] He repeated this verdict, and the $550 million figure, in *Chicago Tribune*, April 2, 1978*a*, and in *Milton Friedman Speaks*, Episode 8, "Free Trade: Producer Versus Consumer," April 27, 1978, p. 18 of transcript.
[25] Wallich (1978, p. 89).
[26] D. Taylor (1982, p. 356).

information from several countries' reported data.[27] Dean Taylor concluded his study with the parting shot that "Friedman's (1953[a]) prediction has proven accurate" in foreshadowing that official actors would not possess superior judgment to that of private-sector participants when it came to the warranted movements of exchange rates (D. Taylor, 1982, p. 367).

In response to Dean Taylor's piece, the official sector swung into action, with the cross-central-bank Working Group on Exchange Market Intervention being set up at a June 1982 summit in Versailles (Bank of England, 1983, p. 384). Subsequently, various items appeared in research and policy outlets defending exchange-market intervention. For example, a Bank for International Settlements working paper by Helmut Mayer and Hiroo Taguchi (1983) offered empirical evidence pointing to the success of intervention, while also providing a scattershot set of arguments challenging Friedman's profit criterion as the basis for evaluating the validity of intervention. And the Bank of England, in effect, published a reply to Dean Taylor in the September 1983 issue of its official organ, the *Bank of England Quarterly Bulletin*. This rebuttal was notably explicit, citing Dean Taylor's work in a footnote to the abstract, and, very unusually for official Bank statements of the time, referring to Friedman by name and quoting his exchange-rate article. Further along in the decade, the Federal Reserve Board undertook detailed scrutiny both of the notion that profits should be a success-criterion for intervention and of the profit-and-loss record of central banks during the floating-rate era. The culmination of this investigation was the research study by Leahy (1995), which argued strongly on analytical grounds that the success (in stabilizing the exchange rate) of official foreign-exchange intervention and the degree of profitability of that intervention had no necessary relationship.[28] The case made in this study was sufficiently compelling that Bordo, Humpage, and Schwartz (2015, p. 21) indicated that it was the basis for their own acknowledgment that the success of official intervention as a force stabilizing exchange rates should not be evaluated by a profitability criterion.

It is notable, however, that despite the challenge to the generality and the validity of profitability as a criterion for judging the policy success of interventions, Leahy (1995) also stressed that, once data for the 1980s were included, more evidence had accumulated that foreign exchange rate intervention by the U.S. authorities had actually been financially profitable. The stress laid

[27] D. Taylor (1982, pp. 357–358).

[28] See especially Leahy (1995, p. 833). Earlier, a different but related aspect of Friedman's (1953a) discussion—specifically, his challenge to the notion that private-sector speculation was destabilizing for an asset price—had been challenged on analytical grounds by Murray Kemp (1964, pp. 264–265). Kemp articulated this challenge in specific reference to the elaborated version of the argument given in Friedman (1960b).

on this outcome reflected the fact that Friedman's profit criterion retained intuitive appeal, even if it was now shown not to be a universally valid metric basis on which to judge whether intervention secured policymakers' aims.

Balance of payments deficits and current account deficits

By the time the aforementioned Leahy study appeared in the mid-1990s, the practice of making foreign exchange intervention with the aim of altering the external value of the dollar had essentially stopped (Bordo, Humpage, and Schwartz, 2015, p. 15). By this stage, monetary authorities, at least in the English-speaking world, had become much more reconciled to, and comfortable with, floating exchange rates. As already indicated, this outcome largely reflected acceptance of Friedman's point about the monetary-autonomy benefits conferred by floating. In the area of international arrangements, it also reflected implicit acceptance of an observation Friedman had reaffirmed in 1977 that, under a float, "there literally is no such thing as a 'balance-of-payments problem." (*Newsweek*, September 5, 1977.)

When Friedman had made this argument in 1953, it had been greeted with scorn by Frank Hahn, who claimed that the notion that a free-market exchange rate could deliver a zero overall balance of payments was "unproven assertion," that floating would allow domestic economic policy to deliver a desired level of (nominal) income an "unproven (and indeed almost completely unanalyzed) assumption," and mocked Friedman's essay for the way in which "Britain's postwar balance of payment problems, by the way, are, without the slightest use of analysis or facts, ascribed to fixed exchange rates!"[29]

Yet Friedman's position that a floating exchange rate would eliminate balance-of-payments deficits was far less controversial than Hahn implied. It was little more than an expression of the truism that, under a pure floating regime, the exchange rate adjusts to ensure that the flows of payments into a country net out to zero. So when, in 1978, a financial commentary stated that "the U.S. has a very large trade deficit, a large current account deficit, and an overall balance-of-payments deficit" (*Dallas Morning News*, February 3, 1978), in listing the three deficits in quick succession, it did not give a very informative picture. The last of the three deficits listed—the balance-of-payments deficit—was, in truth, different in nature from the first two, because it owed its existence to the fact that central banks were not allowing exchange rates to float

[29] Hahn (1954, p. 400).

completely cleanly. Insofar as the U.S. authorities were generating the balance-of-payments deficit by holding up the U.S. dollar through interventions, Friedman regarded the deficit as wholly undesirable.[30] Insofar as the deficit was being generated by foreign central banks' interventions, his feelings were more mixed. Friedman wished that they would not undertake these interventions, though he did not think the United States could stop them from doing so (*Chicago Tribune*, April 2, 1978*a*, p. 8). But he saw a bright side: insofar as they did try to hold their currencies up against the dollar, these countries were not putting their own taxpayers' funds at risk, not U.S. resources (*Newsweek*, September 5, 1977). And attempts by the rest of the world to make investments in the United States (and provide foreign goods) at a stronger exchange rate for the United States than the market would deliver amounted to a subsidy to the United States.[31]

With regard to the other deficits listed in the report—those on the trade and current accounts of the balance of payments—matters were more complicated. Many other than Friedman saw these deficits, particularly the current account deficit, as what should be properly viewed as key drivers of the exchange rate. In this spirit, the early (summer 1977) depreciation of the U.S. dollar was believed to be have been both welcomed and encouraged by Secretary of the Treasury Blumenthal—and as being seen by him as an appropriate means through which a narrowing of the U.S. current account and trade deficits would be brought about (*Detroit Free Press*, August 22, 1977; *Financial Times* (London), November 2, 1978*a*). Later, Board Governor Wallich, though arguing that the dollar depreciation had been excessive, suggested (in his aforementioned February 1978 testimony) that the widening of the trade and current account deficits had been a "major factor in the dollar's recent weakness in the exchange markets."[32] Along the same lines, in the research world, a paper "Exchange Rates and the Current Account" by Dornbusch and Fischer (1980b) postulated that a correctly-functioning floating exchange rate system should deliver values that tended to eliminate current account imbalances.

---

[30] The absence of those central bank operations that are formally categorized as foreign exchange market interventions is not a sufficient condition for the overall balance of payments to have no surplus or deficit, that is, for the balance for official financing (or, roughly speaking, the change in a country's gross official foreign exchange reserves) to be zero. The monetary authority may engage in other operations or transactions that are not designated intervention but that are conceptually similar to intervention and that may produce a nonzero balance for official financing. See Bank of England (1983, p. 384) and Leahy (1995, p. 424).
[31] On this second point, see Friedman's remarks in *Chicago Tribune*, April 2, 1978*a*, p. 8, and *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 36 of transcript.
[32] Wallich (1978, p. 87). Similarly, a *Financial Times* analysis (November 2, 1978*a*) would claim: "The timing of the depreciation of the dollar can be directly linked to the deterioration of the current account of the U.S. balance of payments during the first half of 1977."

Friedman was on the same wavelength as these analysts in a couple of respects: like them, he did believe that exchange-rate depreciations tended to narrow trade and current account deficits; and like them, he favored explaining the 1977–1978 exchange-rate depreciation in terms of economic fundamentals. He nevertheless parted company with them, as he was not well disposed toward making trade or current account imbalances central to the explanation of exchange-rate behavior. Indeed, as discussed in previous chapters, Friedman's argument for floating exchange rates did not rest on any claim that a floating rate would deliver a zero balance, or even necessarily a diminished imbalance, in the current account portion of the balance of payments.[33]

Friedman's belief, articulated in the 1960s, was that the generation of a sustained widening of current account deficit might be part of the proper operation of a country's floating exchange rate, was something he maintained in the 1970s and would develop further in the 1980s. He granted that a current account deficit might require correction in some circumstances (*Newsweek*, September 5, 1977). He did not, however, see that situation as very apposite for the discussion of conditions prevailing in the United States in 1977–1978.[34]

Rather, what he had in 1953 called the "fundamental adjustments" that required a move in the dollar lay elsewhere. "The dollar is weak not because we are importing oil but because we are producing pieces of paper, namely money," Friedman remarked in April 1978.[35] Following policies that stabilized the internal purchasing power of the dollar would mean "we could forget about its external value," he suggested (*Newsweek*, September 5, 1977), and the associated domestic policies, by lowering and then eliminating inflation, in any event provided the only true means of arresting the depreciation (*Chicago Tribune*, April 2, 1978*a*, p. 7).[36]

---

[33] He was therefore not favorably disposed toward characterizations such as that Sylvia Porter made: "our balance of payments is drowning in red ink" (*Detroit Free Press*, August 22, 1977). In this statement, Porter was referring merely to the trade-account subcategory of the balance of payments. That said, Friedman himself did occasionally use "balance of payments deficit" as a (very poor) shorthand for the deficit in the current account of the balance of payments (see, for example, *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 36 of transcript).

[34] See also his remarks in *Milton Friedman Speaks*, Episode 2, "Myths That Conceal Reality," taped October 13, 1977, pp. 32–33 and 36 of transcript.

[35] *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 35 of transcript.

[36] In an appearance on NBC's *Meet the Press* program, Alan Greenspan similarly assessed that participants in the foreign exchange market "are essentially saying that they have very little confidence in the future purchasing power of the dollar—which is essentially a signal that an anti-inflationary policy, a credible anti-inflationary policy, is mandatory for this country" (quoted in *American Banker*, April 24, 1978).

Depreciation, inflation, and the trilemma

U.S. officials *did* see a strong relationship between dollar depreciation and U.S. inflation—but not the one that Friedman emphasized. On the contrary, instead of tracing the exchange rate's course primarily to price-level developments—and ultimately to monetary policy—they invoked a depreciation-induced price-level spiral as part of their *non*monetary accounts of the inflation process.[37] This approach, already used by Arthur Burns after the 1971 and 1973 dollar declines, was affirmed by him from an early stage of the 1977–1978 depreciation. "If the dollar depreciates in foreign exchange markets, that releases forces that tend to raise our price level," Burns stated in July 1977.[38] And when the depreciation intensified, he cited it as one of the factors tending to raise U.S. inflation (see Nelson, 2005). Burns' successor William Miller similarly testified in April 1978: "The decline of the dollar since last September will add about three-quarters of 1 percent to the inflation rate in this country by the end of this year."[39] Miller subsequently continued on this theme, maintaining: "A weak dollar introduces inflation into our economy." (*U.S. News and World Report*, August 7, 1978, p. 19.)

These were arguments to which Friedman had taken exception in discussions of floating exchange rates for twenty-five years. And in an appearance on *Meet the Press* appearance in November 1978, he affirmed: "Arithmetic is one thing, and economics is a very different thing… The great confusion in this area is to confuse particular prices with prices in general."[40] As discussed in Chapter 3 above, Friedman did allow for some lasting implications on potential output of changes in the terms of trade (of the kind that depreciations would induce). But, holding constant this effect arising on the supply side, he expected depreciations to amount to relative-price movements that would over time leave the aggregate price level and its rate of growth unchanged.

The notion that depreciation generated inflation—despite being one of the cost-push explanations that Friedman first challenged in his writings—proved hard for economists, other commentators, and those in policy circles to shake off. Even as central banks accepted the monetary nature of inflation, on the one hand, it was still commonplace to find, on the other

[37] Volcker (1978, p. 8) did acknowledge that higher relative inflation rates acted to promote depreciation. But, as indicated below, he went on to stress depreciation as a factor *driving* inflation.
[38] From Burns' testimony of July 26, 1977, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1977d, p. 70).
[39] From Miller's testimony of April 10, 1978, in Committee on Banking, Finance and Urban Affairs (1978b, p. 136).
[40] *Meet the Press*, NBC, November 12, 1978, p. 4 of transcript.

hand, official statements taking for granted that exchange-rate depreciation generated inflation and that, conversely, appreciation tended to lower inflation. However, an acceptance that these two propositions were not really compatible, and a statement in favor of the notion that depreciations were not a clear-cut source of inflationary pressure (on net), appeared at the official level in 2007 in a speech by a Federal Reserve Board governor. Specifically, Mishkin (2007b, p. 3) noted the relevance, in judging the implications for inflation of movements in the dollar (and in import prices), "the argument made by Milton Friedman… [that a]ny pattern of relative-price changes is compatible with a particular level of the inflation rate. What determines the overall inflation rate is not [the] relative prices [of] one category of goods and services[,] but rather the balance between overall demand and supply in the economy, which ultimately is influenced by monetary policy."

It is also possible to detect another important sign of moves away from the import-price-push conception of inflation (implicit in the view that depreciations produce inflation) in the increasing acceptance over time of Friedman's "trilemma" concept. The proposition of a "trilemma," already discussed in Chapter 4 above, holds that a central bank can choose its country's inflation rate under a float. The trilemma is therefore antithetical to a view that, for given settings of aggregate demand policy, a floating exchange rate is itself a source of inflationary or disinflationary pressure. Over time, it has become more widely understood that the securing of monetary policy autonomy under a floating rate is of practical relevance and is not merely a condition obtaining under restrictive conditions.[41] Along these lines, two notable figures who moved away from the import-price-push position to the trilemma position were Maurice Obstfeld and Paul Volcker. Early in his career, at a conference in Fontainebleau, France, in July 1982, Obstfeld (1985, p. 276) claimed that, for floating-rate countries, "the policy autonomy predicted… never really materialized. Instead, the inflationary effect of exchange rate depreciation emerged as the new external constraint on the conduct of mon policy." In contrast, thirty-five years later, Obstfeld was a strong advocate of the validity of the trilemma (see Obstfeld, Ostry, and Qureshi, 2017). Similarly, Paul Volcker (1978a, p. 8) had contended that "depreciating currencies… exaggerate inflationary forces." But Volcker would later state that "the trilemma and the dilemmas and so forth are all true." (Paul Volcker, interview, October 16, 2013.)[42]

---

[41] For example, such autonomy is fully consistent, as discussed in Nelson (2020d), with comovement of various asset prices across countries. The claim by Fahrer and Shori (1990, p. 5) that monetary policy cannot deliver a chosen inflation rate under a float if there is international capital mobility was certainly not correct.
[42] Meltzer (2009b, pp. 1010–1011) argued that the period after 1978 was when Volcker increasingly discarded cost-push aspects of the analysis of inflation.

Policy coordination and the locomotive theory

As of the late 1970s, however, the resilience of import-price-push views of inflation showed that key aspects of the trilemma notion were still encountering resistance in U.S. officialdom. Furthermore, another aspect of the U.S. authorities' attitude to economic policy in this period worked against the notion of policy autonomy under an exchange-rate float. This was the Carter Administration's encouragement of international macroeconomic policy coordination.

What was sometimes called the "locomotive theory" implied that the engagement of countries like Japan and the Federal Republic of Germany in expansionary aggregate demand policies would make it easier for the U.S. authorities to increase demand, because the U.S. trade deficit was less likely to deteriorate sharply in response to economic expansion at home if the United States' major trading partners were expanding too. A concerted cross-country stimulation of demand was an approach pushed by the Carter Administration at the May 1977 G7 economic summit in London, after whose first session Secretary of the Treasury Blumenthal said of the output-growth aims of the member countries: "We have our targets. We expect to meet them. We will do what is necessary to meet them." (*Kansas City Star* (Missouri), May 7, 1977.) The matter was pressed further at the G7 summit in Bonn held in June 1978—by which time the dollar depreciation had made the U.S. participants still more interested in commitments being made by Germany and Japan to expansionary measures (see Eizenstat, 2018, pp. 210–215).

Friedman was not well disposed toward these arguments. Asked in 1977 whether Germany and Japan were "mainly to blame for not pushing their recovery along as fast as they could have done?," Friedman answered: "No." (*Euromoney*, October 1977, p. 21.) The United States should not complain: "Each country is mostly to blame for its own problems." (*Euromoney*, October 1977, p. 25.)

Friedman addressed the "locomotive" theory more specifically at around the time of the Bonn summit. He agreed that, in an ideal situation, all economies would be operating continuously at a high level. But he also implied that some cyclical fluctuations were unavoidable. And, subject to the acceptance of this reality, Friedman threw doubt on the notion that economies should have closely synchronized business cycles.[43] "Surely, the best situation is for some countries to be in the expansion phase… while others are in the recession phase. In that way, the various booms

[43] As already indicated, Friedman also doubted a key rationale (trade-balance considerations) for the United States' support for simultaneous expansion.

and recessions would at least to some extent average out on a world scale." (*Newsweek*, June 12, 1978.)

In opposition to this argument, those in policy circles at the time could have pointed out that pronounced negative output gaps were prevalent across advanced nations in late 1976—with McCracken and others (1977, p. 339) reporting that an output gap of minus 8.1 percent existed in the aggregate of nine OECD countries as of the second half of 1976—in which case substantial economic expansion by the major economies seemed warranted.[44] This basis for expansionary policies proved to be fragile: it would subsequently be undermined by later revisions to historical output-gap estimates. In the meantime, however, the Carter Administration succeeded in gaining Japan's and Germany's agreement to undertake expansionary measures. The main measures undertaken, however, went in the direction of easing fiscal policy, particularly tax cuts (Eizenstat, 2018, p. 214), rather than monetary policy. Consequently, they were, from Friedman's perspective, were unlikely in practice to boost nominal or real aggregate demand very much in those countries.

Paul Samuelson, often a disarmingly outspoken supporter of Friedman on exchange-rate matters in the 1960s, disagreed with Friedman on the appropriate domestic economic-policy prescriptions for the United States both in that in that decade and in the 1970s. But, with regard to the policy-coordination issue that was so prominent in economic discussions in 1977 and 1978, he once again showed his solidarity with Friedman on matters of international economic policy. Speaking at a conference held in the first week of October 1978, Samuelson remarked: "I have heard people say that we have to have coordinated policies with floating exchange rates. That is what we *don't* have to have." If Germany wanted to orient its aggregate-demand policies on fighting inflation, Samuelson added, "that is its own business under a properly running floating exchange rate."[45]

Yet, less than three months later, *New York Times* economics columnist Leonard Silk would declare Friedman and Samuelson to have had their views on exchange rates refuted. Silk's

---

[44] The same 1977 report gave a negative output gap that was near or in double digits in late 1976 in the case of Germany and Japan (see McCracken and others, 1977, pp. 84, 86).

[45] In Hinshaw (1981, p. 86). For a contemporary report on this conference, see *Los Angeles Times*, October 9, 1978. Although the Federal Republic of Germany's stance remained largely one of floating the mark against the dollar, by this point Friedman had criticized the Bundesbank for interventions it had made during 1977 and 1978 aimed at supporting the U.S. dollar and forestalling mark appreciation (*The Telegraph* (Brisbane), December 12, 1977; *Wall Street Journal*, August 28, 1978).

assessment was that what he considered to be 1978's biggest piece of economic news—the U.S. government's announcement the previous month of a dollar rescue package—had occurred because of widespread agreement that the case for floating rates "argued by many economists as different ideologically as Milton Friedman and Paul Samuelson" had been undermined by recent years' experience (*Fort Lauderdale News and Sun-Sentinel* (Florida), December 31, 1978).

The November 1978 measures

This announcement, issued on November 1, 1978, had been a joint statement by Federal Reserve Chairman Miller and Secretary of the Treasury Blumenthal indicating that coordinated Federal Reserve-Administration actions would begin immediately, with the aim of shoring up the foreign exchange value of the U.S. dollar (*Financial Times*, November 2, 1978*b*).

Among the measures was an end to the incremental official operations undertaken in the foreign exchange market in favor of a larger-scale series of interventions (*Financial Times*, November 2, 1978*b*; Eizenstat, 2018, p. 330). With regard to measures like this, Friedman was more skeptical about the likely impact of the package on the economy. As a rule, Friedman believed that the effects—on the exchange rate and domestic nominal spending alike—of foreign exchange operations by a country's central bank or treasury were lasting if they were unsterilized—that is, if they were allowed to affect the aggregate level of the monetary base. Such non-sterilization created scope for the operation to be associated with reactions of a variety of domestic financial series, including domestic asset prices and monetary aggregates. His longstanding position was that sterilized foreign exchange intervention worked for a time on the exchange rate, then its effect faded out (*Newsweek*, October 11, 1976; *Chicago Tribune*, April 2, 1978*a*, p. 8).[46] This attitude has been borne out by later work: for example, Svensson (2001, pp. 279–280) stated that "most empirical work on the effect of sterilized foreign-exchange interventions indicates that [their exchange-rate] effect is small or even negligible." Friedman considered that the intervention component of the November 1978 measures would, by itself, have a negligible impact on the dollar and the U.S. economy (*Meet the Press*, NBC, November 12, 1978, p. 5; *Newsweek*, January 8, 1979).

[46] As Friedman pointed out (*Newsweek*, January 8, 1979), another measure in the 1978 package—an effort to generate a capital inflow into the United States by new issuance of U.S. government bonds abroad—was bound to have an offsetting effect on the exchange rate in the longer term as repayment (in foreign currency) of the loans produced an outflow. At the time, the U.S. authorities saw merit in this measure in part because it connoted confidence by the U.S. government that the exchange rate would not be lower in the future, when the bonds were redeemed (see Eizenstat, 2018, p. 330).

Some observers saw the dollar package as important in signifying that President Carter was willing to countenance a recession. Alan Greenspan, now a private-sector economist, stated that the measures "increase the risks of recession" (*Kansas City Times* (Missouri), November 2, 1978, p. 1A). Indeed, Paul Samuelson saw the package as having made a 1979 U.S. recession very likely (*Newsweek*, January 1, 1979; *Financial Times* (London), August 6, 1979, p. 16), and Otto Eckstein declared, "We are changing our forecast [for 1979] to 'recession.'" (*Detroit Free Press*, November 2, 1978, p. 19A.) Such commentary was influenced particularly by the extent to which the announced measures were perceived as implying a move to a more restrictive policy toward aggregate demand at home. With regard specifically to the implications of the package for monetary policy stance, an anonymous Federal Reserve Board source was quoted as saying at the time of the announcement: "There's no question that the higher interest rates go, the tighter money gets, the higher the risk of recession." (*Detroit Free Press*, November 2, 1978, p. 19A.)

To Friedman, the domestic-policy aspects of the package were crucial—both if the package was going to arrest the depreciation and if it were going to have the restrictive effects on aggregate demand that Samuelson envisioned. In this connection, Friedman observed that what would really shore up the dollar were "credible measures" to reduce monetary growth (*Newsweek*, January 8, 1979).

In evaluating whether the package would really go in this direction, Friedman emphasized (see *Newsweek*, November 20, 1978) that two of the items in the November 1 announcement—a discount-rate rise (to 9.5 percent) and a reserve-requirement increase—were measures whose overall effect on monetary conditions could be offset by open market operations—and, in the case of reserve-requirement changes, often routinely had been offset in this fashion in the past.[47] The actions with regard to these specific monetary policy instruments did not necessarily have any implications, on net, for the monetary base or broader measures of the money stock (*Meet the Press,* NBC, November 12, 1978, p. 5 of transcript).[48]

---

[47] Friedman had been persuaded already that reserve-requirement changes had been used in monetary policy announcements because they were perceived as a dramatic way of signaling future, more substantive policy moves. The reserve-requirement change certainly was interpreted by commentary at the time as being dramatic, with a *Financial Times* analysis (November 2, 1978*c*) claiming that it figured as being "potentially [among] the most important" of the announced measures and categorically stating that the "withdrawal of $3 billion of bank liquidity represent[s] a major tightening of credit" that would bolster the Federal Reserve's credibility.

[48] The reserve-requirement increase was perhaps especially unlikely to turn out to be a genuinely restrictive measure. In dollar terms, it was the largest increase in reserve requirements undertaken up to that time (*Financial Times* (London), November 2, 1978*d*). But it was a 2 percent *supplementary* reserve requirement on *large* time deposits—not an increase in regular reserve requirements on commercial banks' retail deposits (Miller, 1978d, p. 944; Judd and Scadding, 1979, p. 36). The new requirement burden therefore pertained to wholesale bank deposits

However, Friedman did not rule out the possibility that a genuine monetary tightening might emerge from the package. Of the various announced moves, there was one element that would certainly work in the direction of making monetary policy tighter —even though, curiously, Friedman omitted it from his list of monetary actions in the package (*Newsweek*, November 20, 1978). This was an increase of 25 basis points in the FOMC's federal funds rate target—from 9.5 percent to 9.75 percent (Federal Open Market Committee, 1978, p. 958). This modest increase, taken together with the previous moves up in the federal funds rate, likely helped contain monetary growth in 1978. As discussed in the previous chapter, M2 growth in 1978 was decidedly below 1977's rate and in the ballpark of Friedman's recommended rate for 1978 of 8 percent. Friedman would, as discussed in the next chapter, conclude in early 1979 that a decided monetary policy tightening had indeed occurred in recent months.

On the day of the November measures, President Carter stated that they had been taken because dollar depreciation "threatens economic progress at home and abroad and the success of our anti-inflation program" (*Detroit Free Press*, November 2, 1978, p. 1A).[49] U.S. policymakers' actions therefore reflected the emphasis on dollar depreciation in their analysis of inflation—and so were a manifestation of their continued adherence to cost-push views. However, unlike so many supposed cost-push factors, the exchange rate was at least conceded by policymakers to be a variable that could be influenced by monetary policy. Thus, the nonmonetary view of inflation held by policymakers during 1978 did not stop them from taking certain monetary actions in response to the rise in inflation. As they saw it, a declining dollar was introducing an extra cost-push element into inflation, and, by fortifying the exchange rate through monetary and other measures, they could limit the inflationary pressure arising from this source.

Trade barriers and foreign exchange controls

During 1977 and 1978, Friedman saw the U.S. government's international economic policy as deviating from what he regarded at its ideal configuration not only because it was advancing

---

that were outside M2—whether the M2 considered is the old definition prevailing in 1978 or the modern definition introduced after 1979. Consequently, the monetary impact of this move—as judged by the repercussions for the behavior of M2—depended on whether the reserve-requirement increase on non-M2 deposits had the effect of making increases in M2 more difficult. For example, for a given volume of reserves, a higher requirement on non-M2 deposits might make overall reserves scarce and create downward pressure on M2. But if the Federal Reserve expanded total reserves in line with the higher volume of required reserves, such pressure would not materialize.

[49] Similarly, the record of the FOMC's related deliberations described the rescue package as "a broad government program to strengthen the dollar in foreign exchange markets and thereby to counter continuing domestic inflationary pressures" (Federal Open Market Committee, 1978, p. 957).

measures at international macroeconomic policy coordination in the U.S. authorities' interventions in the foreign exchange market intervention, but also because it was making it more likely that new restrictions would be instituted on transactions related to the trade and capital accounts of the U.S. balance of payments.

Of these, restrictions on the capital account were a possible policy change he feared that was not, in fact, really aired or pursued by the Carter Administration. Certainly, the notion of foreign exchange controls as a macroeconomic policy tool was in the air in economic discussions in this period, thanks in large part to Tobin (1978c, 1978d). Tobin, a one-time virtual ally of Friedman on matters concerning international economic policy, had become disenchanted with floating exchange rates. He now proposed, as a means of organizing the process of intervention, a network of taxes on international capital transactions (an idea subsequently known as the "Tobin tax"). Such a measure would be a streamlined version of the various foreign exchange controls that monetary authorities had used to pursue distinct exchange-rate and demand-management policies. Toward the end of 1978, Friedman suspected that the Carter Administration would want to strengthen the dollar while stimulating aggregate demand and suggested that Carter might introduce foreign exchange controls to do this (*Newsweek*, September 18, 1978).

In the event, of course, the administration instead launched the November 1978 dollar package. The dollar subsequently rallied but, a few months into the new year, as the exchange rate started to falter again, Friedman conjectured that Carter might impose foreign exchange controls sometime later in 1979 or in 1980 (*Daily Telegraph* (London), March 21, 1979; *Financial Times* (London), March 21, 1979). Again, this scenario was not realized, and in 1979 the administration was instead willing to along with a considerable monetary policy tightening as the main means of supporting the dollar.

With regard to trade barriers, President Carter had stated in April 1977: "I am very reluctant to restrict international trade in any way."[50] Nevertheless, the years 1977 and 1978 saw the administration introduce new "orderly marketing agreements" (negotiated quotas on imports) on sales to the United States of footwear produced by Japan and of television equipment produced

[50] In Pater (1978, p. 33), sourcing Carter's remark to *U.S. News and World Report*, April 11, 1977, p. 94. Similarly, Fred Bergsten, assistant secretary of the Treasury on international affairs in the administration stated that "import controls are not a very efficient way to preserve jobs" (in Pater, 1978, p. 31, citing *U.S. News and World Report*, August 8, 1977, p. 25).

by Japan and the Republic of Korea.[51] The administration was also under pressure to introduce new restrictions on steel imports, amid allegations that the low prices of steel imports reflected the dumping of steel on the U.S. market by foreign producers.[52] Speaking in Pittsburgh in October 1977, Friedman declared that protecting jobs in the steel industry would not bolster the overall level of employment in the United States. He also indicated that there was too much activity to stop dumping already: "As a nation, we're stupid to have antidumping laws. They mean that, if someone wants to give us a gift, we should refuse it." (*Minneapolis Tribune*, October 11, 1977.)

In the pre-floating rate era, when confronted with concerns about U.S. producers being hurt by competition, Friedman had frequently invoked the benefits to U.S. consumers that arose from a better terms of trade and the corollary of lower-than-otherwise prices having to be paid for imports (see, for example, Instructional Dynamics Economics Cassette Tape 73, May 10 1971). He had, in particular, used this argument when advocating floating exchange rates in the face of claims that a floating-rate system might lead the United States' trading partners to resort to artificial devices to increase their market share. Back then, Friedman had suggested that, if a country took advantage of a system of more flexible exchange rates to engineer competitive depreciations, the United States should welcome the consequent availability of low-price goods.[53] He continued to make this point in the floating-rate era.

The U.S. public was fairly used to opposition to import restrictions and arguments for free trade being made by economists. However, it was less accustomed to hearing criticism of U.S. trade restrictions when, as with anti-dumping laws, those restrictions were being taken as countermeasures against trading partners' alleged own interference with an ideal free-trade system. Friedman therefore received a stunned reaction, marked by nervous laughter, from his audience when he remarked during an April 1978 speech on free trade: "As a consumer, all I can say is: The more dumping, the better."[54]

By this point, Friedman had given an exposition of his argument in *Newsweek* in a column

provocatively titled “In Defense of Dumping.”[55] The column once again emphasized the benefits to U.S. consumers arising from lower-priced imports.[56] But, having highlighted this point, Friedman’s column transitioned to arguments against restrictions on imports that applied irrespective of whether the restrictions were being imposed as a result of evidence of dumping.

In particular, Friedman restated his oft-used argument that restrictions on imports into the United States would tend to deliver the visible retention of jobs in specific sectors of the home economy, but their counterpart was the dispersed—and so, in effect, invisible—losses of jobs in the rest of the U.S. economy.[57] *Aggregate* employment would consequently not be boosted, on net. Friedman added that restricting imports actually lowered overall living standards: it lowered the home country’s potential output, by making employment less productive and by worsening the terms of trade.

With regard to trade policy generally, the Carter Administration prided itself on the progress it made in negotiating reciprocal reductions in trade barriers (see Eizenstat, 2018, p. 214). Friedman, however, favored a more forthright approach. In his April 1978 speech, he expressed impatience and skepticism regarding the method of securing liberalization via negotiation between countries on reciprocal reductions in trade barriers. In so doing, Friedman echoed sentiments that he had previously expressed about this method.[58] His speech called instead for a unilateral program under which the United States would eliminate barriers to imports entirely over a five-year period—the phased nature of the reductions being designed to allow time for affected industries to adjust gradually.[59] This prescription, which again echoed those he had made in the part, would be reaffirmed in print by Rose Friedman and himself in the 1980 book version of *Free To Choose*.[60]

The assignment issue

Not long before his death in 2002, Rudiger Dornbusch published a retrospective on his time as a graduate student at the University of Chicago in the 1960s. Although Dornbusch's recollections did not seem to be accurate with regard to every detail, one of his pithy characterizations was accurate enough: "For Friedman [the] open economy was a short topic: flexible exchange rates—fully flexible—and free trade. What else was there to say?"[61]

Friedman's open-economy prescriptions were, indeed, straightforward. There was, however, a sense in which they were not as self-contained as Dornbusch implied, as they fit into a broader framework of prescriptions regarding policy assignments. In 1969, speaking at a high level, Friedman described the policy configuration most appropriate for the United States to achieve its macroeconomic goals as consisting of a floating exchange rate to achieve external payments balance, the use of monetary policy to secure price stability, and the setting of fiscal policy to reflect community decisions regarding the amount of resources commanded by the public sector (Instructional Dynamics Economics Cassette Tape 12, January 1969). In effect, this description amounted to an assignment of instruments—albeit one in which the exchange rate would be a market price instead of a policy instrument proper, and fiscal policy would be given little role in the control of aggregate demand.

Public statements by U.S. policy officials in 1977 and 1978 would underline the extent to which, notwithstanding the adoption of floating exchange rates and a degree of influence of monetarism on domestic policy developments, the authorities' views concerning the appropriate assignment continued to differ from Friedman's perspective.

This divergence was evident in the multi-government communiqué that came out of the May 1977 London summit.[62] Although its statement, "Inflation does not reduce unemployment," seemed compatible with Friedman's views, the conflict with his own position was revealed in its observation: "Our most urgent task is to create more jobs while continuing to reduce inflation." As was noted in a monetarist analysis of the communique in Citibank's economic newsletter, the communiqué seemed perfectly consistent with policies oriented toward management of nominal income growth Δx, and possibly also with undertaking such management by focusing on monetary growth Δm (although—as discussed in the previous chapter, as well as below—the

[61] Dornbusch (2001, p. 22).
[62] For the text of this communiqué, see, for example, *Morning Advocate* (Baton Rouge, Louisiana), May 9, 1977.

Carter Administration remained preoccupied with *fiscal* policy's role in demand management). But it was with regard to the link to the connection between the control of nominal income and achieving price stability that the communique really broke decisively with Friedman's views. The Citibank analysts observed that "it's there that the resemblance [to monetarism] ends. Inflation, according to the official thinking that animates the communiqué, is not determined by monetary policy but by such political and physical forces as frosts, earthquakes, strikes, harvests, trade-union strength, and energy prices." (*National City Bank of New York Monthly Economic Letter*, June 1977, p. 14.)

The communique had stated that inflation was "one of the major causes" of unemployment.[63] Like the similar position prevalent in the Ford Administration (see Chapters 3 and 4), this amounted to taking inflation as being—at times when output was believed to be below potential—a largely exogenous process. Inflation (π) in turn was perceived as siphoning off real purchasing power—in effect, rises in π were perceived as crowding out the real growth Δy achievable in any given rate of nominal income growth $\Delta x = \Delta y + \pi$. Friedman was willing to countenance this way of thinking about inflation when contemplating sudden price shocks, but he rejected it as a manner of viewing the longer-term behavior of inflation. And he eschewed the implied conclusion for policy that efforts should be made to reduce inflation by devices other than those involving aggregate demand and that this approach would increase immediately the scope for real growth. Instead, Friedman viewed a period of aggregate demand restriction—entailing a period of slow growth in real and nominal incomes—as being needed for inflation to be brought down, with appreciable real growth possible once inflation was defeated.

Friedman continued to be an active debunker of interpretations of inflation that listed as causes of inflation many of the nonmonetary factors that Citibank had recited. In November 1977, for example, Friedman remarked of recent years' experience: "The increase in petroleum prices has been a negligible cause of higher rates of inflation."[64] A year later, in response to the blame that President Carter and Chairman Miller had been putting on recent increases in basic food prices, Friedman replied: "Why is that people point to food prices as a cause of inflation, but I have seen

[63] *Morning Advocate* (Baton Rouge, Louisiana), May 9, 1977. In the same vein, in January 1978, the first annual report to be issued by the Carter Administration would cast the mission of economic policy as being to "*contain and reduce the rate of inflation as we move toward a fully employed economy*… [R]educed inflation would substantially enhance our chances to maintain a strong economic expansion." (Council of Economic Advisers, 1978, p. 5; emphasis in original).

[64] *Milton Friedman Speaks*, Episode 6, "Money and Inflation," taped November 7, 1977, p. 35 of transcript.

nobody point to the sharp decline in the cost of computers... as a cause of deflation?"[65] Rather, he declared—using a formulation he had used for many years—inflation came "from Washington and nowhere else" (*Meet the Press*, NBC, November 12, 1978, p. 2 of transcript).

Wage-push and the role of unions

U.S. officials were, of course, not remiss in citing domestic sources of inflation. But, in doing so, they largely pointed away from the District of Columbia and instead cited, in particular, autonomous wage pressures across the country. In this, they were supported by Arthur Okun, who gave testimony in March 1977 suggesting that nominal wage growth and inflation were settling back to their normal relationship with each other and that the former was stuck at 8 percent.[66] As discussed in the previous chapter, President Carter was prompted by wage-push, as well as profit-push, views of inflation to introduce wage-price guidelines in April 1978. In making the case for this approach, Secretary of the Treasury Blumenthal remarked at a press conference that "we must work together" against inflation by adhering to the administration's nonmandatory incomes policy. And when articulating the need for the policy's success, he used the "π-squeezes-out-Δy" line of thinking closely associated with nonmonetary views of inflation: if "the program fails, the impact of increasing inflation on the economy… will be severe" (*Detroit Free Press*, April 13, 1978).

Although depreciation and food price movements shaped policymakers' accounts of the course of inflation in 1978, the behavior of wages remained a key part of their account of the longer-term path of inflation, with Blumenthal maintaining during the depreciation period: "We see no evidence that the inflation rate has been jolted upward more than temporarily." (*Daily News* (New York), May 13, 1978.) The following November, CEA chairman Charles Schultze argued for the guidelines as a means of reducing inflation "over a period of time," while contending that measures of this sort "had some effect in the '60s, and they have had an effect in other countries more recently—in Britain for example" (*Arizona Republic* (Phoenix), November 6, 1978).

[65] *Meet the Press*, NBC, November 12, 1978, pp. 4–5 of transcript.

[66] See the written portion of Okun's testimony of March 16, 1977, in Committee on the Budget, U.S. Senate (1977, p. 91). See also the spoken portion of Okun's testimony of April 6, 1977, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1977c, p. 13), in which he repeated this claim while adding that "prices are closely geared to direct costs plus a percentage markup." As indicated in previous chapters, the Federal Reserve leadership had endorsed wage-push theories of inflation for several years—a trend continued by Chairman G. William Miller in 1978 (see Miller, 1978c).

The previous chapter detailed the derisory comments Friedman had regarding, first, James Tobin's urging in 1977 of new wage-price guidelines and, then, the administration's introduction of guidelines in 1978. Just as these years saw Friedman reject direct measures to restrain nominal wage growth as a means of fighting inflation, they also saw him reaffirm that increases in nominal wages were not a source of inflation. Governments were not taking responsibility for inflation when they said that it was "produced by grasping unions," he remarked in a November 1977 speech and, similarly, in a *Newsweek* column the following April, he criticized the tendency to blame inflation on "labor-union intransigence."[67]

In rebutting these interpretations of the inflation process, Friedman highlighted a couple of aspects of wage and price determination. For one thing, as discussed in Chapter 3 above, Friedman stressed that nominal wage growth and inflation need not move together for prolonged periods and that monetary policy's effect operated partially via its influence on variations in the markup. For another thing, he stressed the endogeneity of nominal wage growth and, in particular, its dependence on aggregate demand. As in previous decades, he remained skeptical about the scope for U.S. labor unions to raise aggregate nominal wages, rather than change the division of wages across industries. In a talk on the labor market in September 1977, he affirmed that "the effect of the higher pay of [members of] unions is lower pay for all other workers," arguing that subsequent studies had been in line with his findings to this effect in the research he had done in the 1950s.[68] And it was still the case that those unions that did possess significant market power faced economic limits: "even the powerful trade unions have to recognize the facts of life… The belief that somehow unions have infinite power to impose their will is a myth." (*San Jose Mercury News* (California), February 13, 1979.)

Having exempted the unions from responsibility for inflation, however, Friedman also cast doubt on some of the benefits unions claimed for themselves. "What protects the worker is not the union. What protects the worker is the existence of alternative sources of employment. The true protection [provided for] the American worker has been a vigorous private enterprise system in which the great number of workers have more than one potential employer," Friedman remarked in an interview for a 1978 television documentary on labor unions.[69] From the perspective of

[69] *In Search of the Real America: The State of the Unions*, WGBH Boston, June 12, 1978, p. 10 of transcript.

unions, this was obviously a far less palatable conclusion than Friedman's message about unions and inflation. However, it was not too different a perspective on the labor market from that expressed by Christina Romer thirty-five years later: "basic economics shows that competition between employers for workers can be very effective at preventing businesses from misbehaving." (*New York Times*, March 3, 2013.)

Prior to the 1970s, Friedman had also endorsed broadening antitrust legislation to cover the behavior of unions and not just of firms.[70] His various statements over the years about unions' limited power indicated that he, nevertheless, saw considerable limits on the degree to which antitrust legislation could be relevant to unions. For the most part, Friedman did not consider an individual union to be a monopoly. He opposed laws keeping workers from joining a union or collectively bargaining with the employer as a union.[71] Furthermore, in an economy in which all workers were unionized, he did not believe that this generated a condition of monopoly, provided that there were multiple unions: "If all workers were unionized, then it would be a fight of one union against the other."[72]

What emerges from these various Friedman remarks on the labor market is that the antitrust laws regarding unions he had in mind were ones that would prevent actions taken by unions to combine in the exercise of their power: for example, via the pooling union strength into a peak union body that could direct industry-wide or economy-wide action across industries covered by different unions. And as indicated in Chapter 5 above, after 1973 Friedman was not in favor of wide-ranging antritrust laws. Perforce, his earlier recommendation that antritrust be widened to cover unions had now been superseded.

In this new context, Friedman's position regarding unions was that "I am only arguing against governmental immunities and special privileges."[73] In particular, both before and after his change in position regarding antitrust, Friedman opposed government laws or regulations that strengthened unions *vis a vis* the rest of the workforce—for example, by requiring union membership, or by insisting that firms that were in government contracts hire labor for the contracted project exclusively from unions. He preferred an approach in which the public sector

[71] See, for example, his remarks in *The Jay Interview*, ITN, July 17, 1976.
[72] *In Search of the Real America: The State of the Unions*, WGBH Boston, June 12, 1978, p. 11 of transcript.
[73] *In Search of the Real America: The State of the Unions*, WGBH Boston, June 12, 1978, p. 13 of transcript.

took a neutral role regarding the relationship between private-sector employers and employees.[74] In addition to raising objections to laws that specifically favored unions, Friedman had suggested in his 1950s and 1960s writings that damage to property or other violence that arose in protests by unions did not necessarily give rise to government prosecution when such prosecution would arise if comparable actions arose in other contexts.[75] He reaffirmed his concern about "differential enforcement of the ordinary laws" in this connection in his 1970s discussions (*The Jay Interview*, ITN, July 17, 1976). The example he gave in 1977 was that of a car being overturned: this did not seem to give rise to prosecutions in cases when it arose from union members' actions in the heat of a dispute with employers.[76] Friedman also criticized cases in which the government tacitly sanctioned, if only through inaction, the practice of unions taking disputes beyond the domain of the affected firm, particularly through the device of mass picketing. Correspondingly, he had praised President Ford for vetoing of a bill that would have put restrictions on how far-reaching union picketing could be (*Newsweek*, January 19, 1976).[77]

Friedman was, however, opposed to laws sometimes introduced, particularly by governments in U.S. states, to try to outlaw the "closed shop"—that is, the practice in which a firm agreed to an arrangement in which all its employees were required to join a specific union. He indicated in the 1960s that the closed shop emerged from a voluntary agreement and should be legal.[78] Friedman reaffirmed this position in 1977, while adding the proviso that the closed shop should not arise from, or be enforced by, government edict.[79]

"*Capitalism*"

Of course, to the most politically radical and self-proclaimed proponents of workers, labor's

---

[74] For documentation of this and the previous sentence in the text, see, for example, *Milton Friedman Speaks*, Episode 13, "Who Protects the Worker?," taped September 29, 1977, pp. 13, 21 of transcript.
[75] See Friedman (1951b, p. 215), in a passage reproduced in Friedman (1962c, p. 161;1976b, p. 165).
[76] *Milton Friedman Speaks*, Episode 13, "Who Protects the Worker?," taped September 29, 1977, p. 14 of transcript. Friedman had given the same example in *Speaking Freely,* WNBC, May 4, 1969 (p. 16 of transcript), Instructional Dynamics Economics Cassette Tape 182 (early December 1975), and *The Jay Interview*, ITN, July 17, 1976.
[77] See also Friedman's remarks on *CBS Morning News*, CBS, January 9, 1976, p. 23 of transcript. For his remarks on mass picketing, see Friedman (1951b, p. 215), in the passage reproduced in Friedman (1962c, p. 161;1976b, p. 165). In addition, in 1976, Friedman remarked: "I don't believe it [collective bargaining] is [a restraint of trade] at all. If a group of workers get together and they would like to have some single person bargain for them, that's not an act in restraint of trade. What's in restraint of trade is when they set up pickets and prevent other people from going to work." (*The Jay Interview*, ITN, July 17, 1976.)
[78] Friedman (1962a, p. 116). In the same vein, conservative columnist John Chamberlain (*The Meriden Journal* (Connecticut), June 3, 1965) and Allan Meltzer (2004, p. 198) implied that Friedman's stance on the labor market most likely included opposition to "right to work," or anti-closed-shop, legislation.
[79] *Milton Friedman Speaks*, Episode 13, "Who Protects the Worker?," taped September 29, 1977, p. 34 of transcript.

interests would not be well served either by market forces, as Friedman suggested, or by strong unions, but by the displacement of the market system itself. This sentiment found expression in a mainstream U.S. economic journal when Leonard Rapping—a one-time member of Friedman's Price Theory class who, in his own account "became a Friedmanite" and whose research had defended and developed natural-rate ideas, but who subsequently described himself as having "jettisoned Chicago economics"—was asked to contribute a paper to the *American Economic Review*.[80] The tone of this self-labeled "radical critique" was set in its first sentence: "Capitalism by its very nature is an exploitative system." (Crotty and Rapping, 1975, p. 791.)

Despite the sharp divergence in viewpoints that had emerged between the two of them by 1977, one thing Friedman and Rapping continued to have in common was a willingness to use the term "capitalism." During 1977, Friedman used the term "capitalism" in the title of two major talks: a setpiece speech titled "The Future of Capitalism," delivered at both the University of Reno, Nevada, and Pepperdine University during the first half of February, and one on "Is Capitalism Humane?" on September 27 at Cornell University.[81] And, of course, fifteen years earlier, he had published a book titled *Capitalism and Freedom*.

It is worth looking into the apparent alacrity with which Friedman—on these occasions at least—used the term "capitalism."[82] Thygesen (1977, p. 82) suggested that the title *Capitalism and Freedom* was provocative. This might appear surprising, as the title of *Capitalism and Freedom* certainly seems less provocative—in the sense of embedding a particular point of view—than the title of Hayek's *The Road to Serfdom* was in 1944 or is today. The reason the title might have seemed provocative in 1962 is that it signified the endorsement *by an advocate of free markets* of the term "capitalism."[83] That term had been promulgated by the Communist or Marxist political and economic literature, and in the 1950s—as well as subsequently, as the above quotation from Crotty and Rapping (1975) brings out—it had tended to be used in the West by critics of the market system and by advocates of greater government intervention (among them non-

---

[80] The quotations are from Rapping's May 1982 remarks in Klamer (1984, pp. 220, 227).

[81] For various records of these speeches, see Friedman (1977f, 1977l, 1978b, 1983b) and *Milton Friedman Speaks*, Episode 3, "Is Capitalism Humane?," taped September 27, 1977. See also the discussion in Chapter 7 above.

[82] This discussion of the term "capitalism" is an expanded version of one that originally appeared in the drafts available publicly in 2015–2019 of Nelson (2020b, Chapter 11).

[83] Bennett McCallum wrote in an email to the present author (August 18, 2008): "I think that it is possibly true that free-market supporters avoided the term 'capitalism.' In fact, I still think of it as a rather poor term. Free markets help everyone (on average), not primarily capitalists."

Communist critics such as social democrats).[84]

In light of this background of past usage, many Western commentators in the early postwar decades evidenced reservations about using the term "capitalism," seeing it as a concession to the anti-market side. For example, Hayek (1944, p. 77) had treated the term as a label that critics of the market used.[85] And when, in the early 1970s, Soviet commentaries on Western society began avoiding the term "imperialist" and also started to take "capitalist" out of rotation in favor of references to the "other social system," this was seen as the adoption of more-measured language on the part of the USSR (Leites, 1973, p. 34).

Friedman himself was aware of the problem of adopting Soviet terminology. In 1957, in reference to the use of economic-planning terminology in the United States, he observed that it was "another one of those terms we have borrowed from the Communists."[86] Indeed, in 1947, in describing non-planned economies, he had opted for the term "free-enterprise exchange economy." And his 1952 statement of position was called "Free Enterprise in the United States" rather than "Capitalism in the United States."[87]

Friedman nevertheless warmed to the term "capitalism" during the 1950s. In a 1953 radio appearance, he said that it was used as both a hopeful and a pejorative word (NBC, 1953, p. 1). In 1954, he made a facetious reference to the usage of "capitalist" as a negative term.[88] And in 1958, as discussed in Nelson (2020a, Chapter 10), Friedman used "Capitalism and Freedom" as the title of a book chapter he contributed.[89]

Too much significance should not, however, be read into Friedman's choice of the title

---

[84] The term "capitalist" may, however, have been in greater usage in mainstream economics literature in the United Kingdom than in the United States. For example, R.J. Ball (1964, p. 177) referred to the "developed capitalist economies" of the Western world, and Kavanagh and Walters (1966, p. 94) to the "capitalist countries." To some extent, the term was accepted also in the U.S. economic literature, too. For example, Phillips, McManus, and Nelson (1937, p. 120) referred to the "capitalistic process of production." As discussed presently, one of the contexts in which the term was in more wide use was in referring to firms' capital-raising rather than to the market system as a whole.

[85] However, Hayek later edited a book titled *Capitalism and the Historians* (Hayek, 1954).

[86] From Friedman's March 26, 1957, testimony, in Special Committee to Study the Foreign Aid Program (1957, p. 129).

[87] See Friedman (1947, p. 407; also 1955c, p. 362) and Friedman (1952).

[88] Specifically, in a BBC radio appearance (September 29, 1954, p. 11 of transcript), Friedman referred to "the good old days of so-called capitalist exploitation."

[89] Friedman (1958c). Nonetheless, in another publication the same year, Friedman also opted for the terminology "free enterprise market system" (Friedman, 1958d, p. 22).

Capitalism and Freedom. One pro-market book, of which Friedman was aware by the early 1960s, had used "capitalism" in the title as far back as 1940.[90] Furthermore, in the summer of 2008 Anna Schwartz suggested to the present author that the overriding consideration behind the title *Capitalism and Freedom* was the need for a catchy and descriptive title. The use of the term "capitalism" in economic analysis also had a University of Chicago pedigree. For example, Frank Knight, although he had once observed that Marx "made capitalism a household word" (Knight, 1928, p. 119), himself used the term frequently.

It is, nevertheless, noteworthy that Friedman did not, on the whole, regard "capitalism" as a term to be shunned. Claire Friedland, who was located at the University of Chicago (first as a graduate student and subsequently as a collaborator on research with George Stigler) in the years in which Friedman composed and finalized *Capitalism and Freedom*, remarked that "of course, what he really meant was 'free markets,' or the system in which the entrepreneur is the important actor. And somebody might have said to him, 'Capitalism has a bad name.' And he might have said, 'I don't care. That's what we call it.'" (Claire Friedland, interview, October 27, 2014.) Friedman's employment of the term "capitalism" in his book's title and text, combined with the eventual success of his book—its cumulative sales making it one of the University of Chicago Press' highest-selling titles—helped shift the term's status from one that free-market advocates eschewed to one that many of them embraced.[91]

It is worth recording, however, that Friedman nonetheless displayed some backtracking after 1962 in his use of the term "capitalism." In 1965, for example, he instead deployed the term "free competitive enterprise system."[92] A *Newsweek* column later in the decade (June 24, 1968) used "free markets and private enterprise" rather than "capitalism," and Friedman referred on another occasion to the "free enterprise market mechanism" (Instructional Dynamics Economics Cassette Tape 2, November 1968). Although Friedman referred to the "capitalist system" in the early 1970s, he did so partly in the narrow context of describing the manner in which firms raised funds for investment, not in the broad sense of the market economic system.[93]

---

[90] This was Carl Snyder's *Capitalism the Creator* (1940) which Friedman and Schwartz (1963a, pp. 413, 692) cited, and which, like *Capitalism and Freedom*, laid out a monetary interpretation of the Depression.
[91] A more recent example of a free-market advocate's acceptance of the term "capitalism" was Meltzer (2012).
[92] Friedman (1965b, p. 7). Rose Friedman also used this term (see R.D. Friedman, 1976, p. 29). Other terms Friedman used included "free enterprise systems" (Friedman, 1961d, p. 534), "free enterprise/competitive enterprise system" (Instructional Dynamics Economics Cassette Tape 70, March 29, 1971), "private enterprise exchange economies" (Friedman, 1976b, p. 6), and "market system" (*St. Louis Globe-Democrat*, December 9, 1965).
[93] See Instructional Dynamics Economics Cassette Tape 72 (April 21, 1971). This usage of the term "capitalist" is also prevalent in the economic-research literature. See, for example, Woodford (1988).

Friedman's ambivalence about the term "capitalism" emerged again when in a debate with Irving Kristol in the mid-1970s. Replying to Kristol, Friedman referred to "the system… that he describes as capitalism and I describe as free enterprise."[94] And even though Friedman's 1977–1978 speeches noted above prominently used the term "capitalism," it was the case that, subsequently, "capitalist" and "capitalism" appeared only infrequently in the book version of *Free To Choose* in 1980.[95] That said, the early 1980s seem to have ushered in another period in which Friedman seemed comfortable with the using the term "capitalism," much as he had been twenty years earlier.[96]

Capitalism and imperfect competition

Occasions on which Friedman appeared comfortable with the term "capitalism" or "capitalist" included those when he contrasted market arrangements with socialist arrangements. A prominent example of this was his September 1977 "Is Capitalism Humane?" speech noted above.[97]

Friedman did have one major source of hesitancy in using the term "capitalism" in making such contrasts—a reservation he noted in his 1977 talk on "The Future of Capitalism." He was concerned that the word "capitalism" was not particularly useful in singling out properties

---

[94] From Friedman's remarks in Friedman and Kristol (1976, p. 22).

[95] Friedman *had* used the term liberally in "Capitalism and the Jews," a piece that, like *Capitalism and Freedom*, likely had a deliberately provocative title. Friedman gave this paper in lecture form as "Capitalism and the Jew" at the Washington Hebrew Congregation in Washington, D.C., on December 11, 1966, and as "Capitalism and the Minority Groups" at the Twelfth Annual Park Synagogue Forum in Cleveland in March 1971 (*Evening Star* (Washington, D.C.), October 22, 1966; *Cleveland Press*, March 8, 1971). (The existence of these early versions indicates that the dating by Vallois and Chassonnery-Zaïgouche, 2021, dating of the Friedman's iterations on the speech as starting in 1972 is not warranted.) He then presented a revision, with the "Capitalism and the Jews" title, at the Mont Pelerin Society meeting of 1972 (see Rose Friedman's remarks in Friedman and Friedman, 1998, p. 335), as a lecture at the University of Chicago in October 1976, and to the Fraser Institute in Canada in August 1982, before publishing a little-revised version in 1984 (Friedman, 1984e; see also Friedman, 1985b).
In the talk, Friedman contended that Jewish culture, in the face of stereotypes linking Judaism with business success, had tended to react to the stereotypes by generating intellectual traditions that he felt were unduly hostile to capitalism. Friedman's analysis of the historical and cultural issues involved was, however, criticized as superficial by conference participants on a number of the occasions on which he gave the talk (see, for example, Frankel, 1983, 1985, and Friedman's own account of the reaction in Block, Brennan, and Elzinga, 1985, p. 459, as well as his remarks in Friedman, 1985c).

[96] See especially Friedman's (1984a, p. 47) matter-of-fact reference to "the United States, Britain, or other capitalist countries." See also his other remarks given around the same period in *California* magazine (October 1984, p. 79) and his endorsement of Brookes (1982).

[97] Other discussions in which Friedman used "capitalist" or "capitalism" in reference to the market system when juxtaposing it against planned-economy arrangements included Instructional Dynamics Economics Cassette Tape 58 (October 4, 1970), and *Newsweek*, March 5, 1979.

special to a market economy—as the operation of planned economies, too, involved accumulation of capital.[98] Subject to that qualification, however, Friedman did regard "capitalism" as a useful catch-all term for the market economic system when contrasting it with centrally planned economies.

In particular, Friedman was willing to use "capitalism" as a term for the market system as it existed in practice. He stressed that, in reality, any market system observed in practice was really an approximation to an idealized conception of capitalism, because a sizable state sector existed in any real-world system.[99] Nor did he regard capitalism and perfect competition as necessarily synonymous. Although Leonard Rapping would imply that some 1960s University of Chicago teachers and graduates had come to take perfect competition as applying literally to the U.S. economy (see Klamer, 1984, p. 221), he did not specifically apply this criticism to Friedman. And, indeed, it did *not* apply to Friedman, as stressed in Nelson (2020a, Chapter 9). Friedman was not under any illusions that conditions of perfect competition well described actual market behavior right across the U.S. economy. But he also stressed that the elements of imperfect competition seen in practice were amenable to analysis using the standard tools of economics. He also underlined that the advanced economies did exhibit to a large degree the key theoretical features of a market system, including resource allocation and decisions based on a freely operating price system, private property, and voluntary exchange.[100]

Friedman remarked in an interview in June 1978 that economists' understanding of imperfect competition had advanced in recent years—specifically through improvements in the analysis of the operation of cartels.[101] He was probably referring to research he had seen regarding the decision-making process of the OPEC cartel. Nevertheless, his observation had more general application, because the years leading up to Friedman's remark had been a vibrant period for research on imperfect competition. Two items published in 1977 are particularly notable in this connection, though they may not have actually especially registered with Friedman at the time.

---

[98] See *Milton Friedman Speaks*, Episode 3, "Is Capitalism Humane?," taped September 27, 1977 (p. 22 of transcript) and Friedman (1978b, p. 1). Much earlier, in April 1966 remarks (Friedman, 1966c, p. 33 of 1970 printing), Friedman had cited the same grounds as the basis for his contention that "capitalism" was a "highly misleading" term.

[99] See *Milton Friedman Speaks*, Episode 3, "Is Capitalism Humane?," taped September 27, 1977, pp. 14–15 of transcript, and Friedman (1983b, p. 87).

[100] See, for example, *Milton Friedman Speaks*, Episode 3, "Is Capitalism Humane?," taped September 27, 1977, pp. 5–6 and 14–15 of transcript, and Friedman (1983b, pp. 85–87).

[101] *Human Behavior*, November 1978, p. 31. (The interview was conducted on June 26, 1978, the day after the Friedmans' fortieth wedding anniversary. See *Human Behavior*, November 1978, p. 30.)

The first was Dixit and Stiglitz's article in the June 1977 issue of the *American Economic Review* article developing and further formalizing monopolistic-competition models. In the same journal just three months earlier, Franco Modigliani (1977, p. 6) had asserted that Friedman's 1968 exposition of the natural rate hypothesis had required a perfect-competition, one-good model, as well as a homogeneous labor input. Presumably Modigliani believed that implicit assumptions of this kind were necessary in order to Friedman to carry out the consideration of aggregate goods prices (and aggregate wages) in which he engaged. In discussing Modigliani's paper early in 1977 (see the previous chapter), Friedman had rejected the notion that his analysis implied or required a single good, homogeneous labor, or perfect competition. Dixit and Stiglitz (1977) in effect provided a framework that definitively refuted Modigliani's contention. They showed that a model in which there was a multiplicity of firms, each producing a different good and possessing some pricing power over their product, was amenable to an aggregate model in which there was a single, composite good. Subsequently, in examining the implied imperfect-competition macroeconomic models, Blanchard and Kiyotaki (1987) showed that the natural rate property prevails in both the short run and the long run of the flexible-price version of these models, as well as in the long run of the sticky-price version.[102]

A second important contribution on imperfect competition in 1977 was the monograph *Oligopoly and the Theory of Games*. Although the book restricted itself to theoretical analysis, its applicability to the analysis of the world oil price was not lost on readers, and some later research on OPEC (for example, Marshalla and Nesbitt, 1986, pp. 2, 7, 21) would have occasion to cite the book for its formal analysis of cartels while also quoting from Milton Friedman's popular writings on the first oil shock.

Oligopoly and the Theory of Games, published by North Holland, had been written by James W. Friedman. James Friedman, no relation to Milton Friedman and twenty-six years younger than him, had followed doctoral studies in economics at Yale University with five years (1963–1968) as an assistant professor in the department.[103] James Friedman was therefore located at Yale University during the period in which the macroeconomic debate between James Tobin and Milton Friedman took off, and he happened to possess a combination of their names to boot. As James Friedman was a microeconomist, one might expect that the link between James Friedman and the Tobin-Milton Friedman debates was limited to his Yale University background and the

---

[102] See also Erceg, Henderson, and Levin (2000) for a generalization of this approach that featured Dixit-Stiglitz aggregates of heterogeneous supplies of labor input.
[103] See American Economic Association (1981, p. 152) and Blaug (1986, p. 290).

coincidence of names.[104] This, however, proved not to be the case. From 1977 onward, James Friedman would be repeatedly cited in the literature that pursued the themes that had featured in the Milton Friedman-James Tobin debates up to that point: on whether fiscal policy was powerful, on the case for policy rules, and on natural-rate models of inflation and real economic activity. What is more, the authors tending to cite James Friedman's name would be on the side of the debate that was adverse to Tobin's economics. For his part, Milton Friedman, largely out of the research debate by this point and not well versed in its technical side, would never cite James Friedman. But James Friedman's work was invoked by several other, newer-generation macroeconomists, who in important respects carried on the pro-monetary rules, pro-natural-rate-hypothesis, and anti-fiscal-activist positions that Milton Friedman had championed.

In particular, a celebrated paper on the intertemporal analysis of policy rules, "A Positive Theory of Monetary Policy in a Natural Rate Model," by Barro and Gordon (1983a), as well as the authors' (1983b) companion paper, contained no Milton Friedman citation, but both papers cited J.W. Friedman (1971) because of its application of dynamic game theory to the notion of time consistency.[105] In addition, Barro and James Friedman, who were colleagues in the economics department at the University of Rochester for several years, wrote a paper together in 1977 that generalized the Ricardian-equivalence proposition concerning fiscal policy.[106]

The Barro-J.W. Friedman paper, appearing in the August 1977 issue of the *Journal of Political Economy*, was immediately followed in the same issue by an article on a similar subject. This abstract of this article (Mohabbat and Simos, 1977, p. 851) referred to "Friedman's contention" and indicated that the results presented would "overwhelmingly support Friedman." These formulations underlined the fact that—to many in macroeconomics in this era—"Friedman"

---

[104] James Friedman's Yale University period did, however, involve an affiliation with the Cowles Foundation. The foundation's seminars during this era were regularly attended by all affiliates even when the seminar topic was outside their field (William Brainard, personal communication, February 25, 2021). Of the Cowles Foundation seminars that James Friedman likely attended in the period 1959−1968, the main two that concerned topics associated with Milton Friedman's research were one given by A.W. Phillips (on stabilization policy) on February 28, 1963, and one given by Allan Meltzer (on money, credit, and interest rates) on January 22, 1965. See *https://cowles.yale.edu/cf-seminars*. There were also some other talks concerned with the key monetary and financial issues facing specific countries.

[105] In a similar manner, Blanchard and Fischer (1989a, p. 621) cited J.W. Friedman (1977) on time consistency, while Canzoneri and Henderson's (1991) book-length study of monetary policy contained multiple James Friedman citations and none of Milton Friedman (who was, nevertheless, implicitly acknowledged via the authors' practice of referring to James Friedman by his full name in the text—see their page 4). In addition, because Milton Friedman had his own body of work in price theory, the two would sometimes both receive citations in microeconomics texts. For example, Cowell (2006, p. 477) cited J.W. Friedman (1971) and Friedman and Savage (1948).

[106] James Friedman was at the University of Rochester from 1968 to 1983 (Blaug, 1986, p. 290), a period encompassing Barro's first spell at the institution (1975 to 1982).

could only mean one person, and that person was Milton Friedman. In this atmosphere, it is not surprising that the uptick of citations, in macroeconomic contexts, of James Friedman's work would on occasion see him confused with Milton Friedman. For example, in Currie and Levine's (1993) book on macroeconomic policy coordination and rules, James Friedman was cited in the text (p. 251), but this mention showed up in the book's index entry for Milton Friedman (p. 423). The confounding of names also sometimes went the other way, with the bibliography in a chapter of Thomas Sargent's *Macroeconomic Theory* text referring (1987, p. 131) to "Friedman, J. (1968) 'The Role of Monetary Policy.'"

The strong attention given to James Friedman in both the microeconomic and macroeconomic literatures was reflected in his inclusion in the second edition of *Who's Who in Economics* in 1986. In contrast to the first edition, in which he had not appeared, James Friedman now received an entry—one appearing right ahead of Milton Friedman's.[107] But it can also be discerned that by the mid-1980s—perhaps in view of the proliferation of references to him in the macroeconomic articles appearing on what could broadly be considered the "Milton Friedman side" of debates on monetary and fiscal policy—James Friedman had decided to call time on the drawing of connections between himself and Milton Friedman. James Friedman published a new monograph, *Oligopoly Theory*, in 1983.[108] In the opening pages of the book, James Friedman lashed out at his near-namesake. After contrasting Milton Friedman's views on economic-research methodology with those of Tjalling Koopmans, James Friedman declared: "The reader is entitled to know that my view is more closely aligned with that of Koopmans."[109]

---

[107] See Blaug (1986, pp. 290–291).

[108] The new James Friedman book appeared just as he was starting a new position as a professor of economics at Virginia Polytechnic Institute (see Blaug, 1986, p. 290). This was an institution in which Milton Friedman's son David had served as an assistant professor in the period from 1976 to 1980 or 1981 (see American Economic Association, 1981, p. 152, and *http://www.daviddfriedman.com/Academic/Academic.html*). David Friedman had received a Ph.D. in physics in 1971 from the University of Chicago and had then been a research associate in physics in 1971–1973 at Columbia University. However, as noted in Chapter 5 above, he had written a popular book in economics in 1973—one Milton Friedman in June 1978 described as "a damned good defense of that [near-zero-government] position" (*Human Behavior*, November 1978, pp. 31–32)—and, at around the same time, moved into teaching economics. Rose Friedman judged of herself and her husband that "we made a mistake" in urging on David Friedman to pursue a career in a field other than economics: "we brainwashed him; we weren't very subtle." She confirmed that upon David Friedman's move into economics, "he has such enthusiasm for his work now," while adding: "He's a wonderful teacher, just like his father." (*The Anchorage Times* (Alaska), June 10, 1977.)

[109] J.W. Friedman (1983, p. 16). Earlier, with regard specifically to microeconomics, James Friedman had exhibited signs of criticism of Milton Friedman's outlook. Although Milton Friedman often likened information generated by historical experience to the outcomes of natural experiments, he was skeptical of the feasibility of true (laboratory-type) experiments as economic-research tools, even in microeconomics. For example, Wallis and Friedman (1942, p. 181) had declared that "it is probably not possible to design a satisfactory experiment for deriving indifference curves," while Friedman (1955a, p. 908) had referred to "the difficulty of making experiments in economics." Twenty-five years after the latter remark, James Friedman opened a book review in the *Journal of Political*

Nevertheless, James Friedman had shown notable affinity with Milton Friedman, including on methodological matters, in the aforementioned Barro and J.W. Friedman (1977) article, particularly in its concluding section (pp. 848–849) titled "Human Capital." The general subject matter of that section was in itself closely associated with Milton Friedman. But the detailed content of the section had the effect of deepening the connection to Milton Friedman's work. Specifically, Barro and James Friedman treated the stock of human capital in the economy as capable of being represented in macroeconomic analysis by a single aggregate—one that could be included in the economy's production function. As will now be discussed, simply by accepting the notion of an aggregate stock of capital—whether composed of human capital or machinery—this paper was part of a tradition that implicitly supported a key aspect of Milton Friedman's methodological position. And, in taking this stand, the authors were also, in effect, taking sides (and taking the same side as Milton Friedman) in one of the more heated debates on aggregate-supply issues to take place in economic research in the 1960s and 1970s.

The capital controversy

The year 1977 saw a new research journal appear in the United Kingdom: the *Cambridge Journal of Economics*. At the time of its creation, this journal was strongly associated with Cambridge University's tradition of harder-line Keynesian economics, as expounded especially in the postwar period by Joan Robinson and Nicholas Kaldor. Francis Cripps recalled of Robinson's attitude during the 1970s toward younger-generation figures at the university, like himself and Wynne Godley: "she was very supportive… She kind of wanted to believe that the new generation would carry on the tradition and carry on the fight." (Francis Cripps, interview, January 22, 2015.)

To subscribers to this tradition, the "fight" was both against monetarists and against mainstream American Keynesians of the Paul Samuelson type. Reflecting this attitude, the inaugural year of the *Cambridge Journal of Economics* included both an article by Cripps (1977), challenging Friedman's monetarist propositions, and one on stabilization policy by Robinson and Wilkinson

---

Economy by observing, "Most of us have encountered the remark that economics is not an experimental discipline," while going on to contend that there was "an active tradition going back more than three decades which belies this assertion." (J.W. Friedman, 1980, p. 1064.) He later noted that his own "[e]arly work centered on laboratory experimentation, which I believe to be a neglected, [and] potentially very illuminating[,] method of [carrying out] empirical investigations." (Blaug, 1986, p. 291.) In May 2010, James Friedman attended a special seminar on the making of experimental economics, and in one exchange he built on comments made by Alvin Roth regarding the spur that scorn toward experimental economics had given to the new field. Roth had referred specifically to the "negative impetus" generated by Wallis and Friedman (1942). See Svorenčík and Maas (2016, p. 88).

(1977), in which the authors took Paul Samuelson to task for having promoted what they saw as a watered-down version of Keynesianism (making him, as they put it, one of the "bastard Keynesians").[110]

The criticism given in the *Cambridge Journal* of Samuelson, however, extended beyond stabilization-policy matters. The journal's first year of articles also included a critique by Pasinetti (1977) of Samuelson's contributions to capital theory. Pasinetti's article was contributing to a debate that, by 1977, was of long standing. The debate was widely known as the "Cambridge-vs.-Cambridge" debate, owing to the fact that it arrayed Cambridge University against MIT, whose location was of course in the Greater Boston-area city of Cambridge. The debate specifically pitted MIT economists—including Samuelson, Robert Solow, and Franco Modigliani—against leading figures in Cambridge University's economics world—among them older-generation Keynesians such as Robinson and Kaldor.[111]

In the United States, the debate particularly occupied Paul Samuelson. This had been especially the case during the 1960s, and his concern with the debate showed though in some of the revised editions of his undergraduate textbook. Samuelson's text would eventually contain material that, in the judgment of Gregory Mankiw, amounted to "nothing that you would ever want to teach to a freshman," and that reflected Samuelson's research interests at his time of writing (Gregory Mankiw, interview, September 24, 2013). In this connection, Mankiw pointed to Samuelson's coverage of the "reswitching" controversy—"reswitching" being an alleged property of the production function that was given considerable attention in the Cambridge-versus-Cambridge debate. One example of Samuelson's textbook coverage of reswitching is provided by the eighth edition of Samuelson's textbook—the first edition for the 1970s—in which Samuelson's discussion included a subsection titled "Alternative Theories: Repudiation of Aggregate Production Functions" (Samuelson, 1970, p. 734).[112]

"Of course, Paul Samuelson was fighting on two fronts," Christopher Bliss—watching the debate from Cambridge University—observed with regard to developments in the second half of the

---

[110] See Robinson and Wilkinson (1977, p. 7). Of course, Robinson had used this pejorative term before 1977, too.
[111] Among the contributions to the debate were the Solow and Samuelson contributions discussed below as well as Samuelson and Modigliani (1966). For overviews of the debate, see, for example, Blaug (1975), Bliss (2010), Burmeister (1980), and Harcourt (1972). The more recent retrospective by Baqaee and Farhi (2018) is notable for casting the debate, particularly its coverage of aggregate production function, in terms of implications for the construction and specification of modern macroeconomic models.
[112] In addition to this subsection, Samuelson included a discussion of reswitching on page 590 of his text, and it was the latter discussion that was referenced in the book's index entry on "reswitching."

1960s. "He was fighting, on the one hand, across the Atlantic against Cambridge, England, on the production process; and he was also fighting on his back against Milton Friedman from Chicago. And I think, probably, that the second battle was the one he cared most deeply about." (Christopher Bliss, interview, January 2, 2015.)[113] Of the two debates, however, the Cambridge-vs.-Cambridge debate accounted for a greater proportion of Samuelson's research activities, and he acknowledged that he spent much time "pondering over the economic ideas of Joan Robinson and Nicholas Kaldor at Cambridge University" (*Boston Globe*, February 26, 1967).

By 1977, Milton Friedman was fighting on two fronts, too. He had, of course, been engaged in debate with MIT-based economists for several years. With regard to Cambridge University economists, his relationship had evolved over the previous quarter-century: from disagreement coupled with collegial relations in the 1953−1966 period, to more clear-cut acrimony thereafter.

After he had visited Cambridge University in the 1953/1954 year, Friedman had served, from 1956 to 1966, as coeditor of the Cambridge University Press' flagship line of *Cambridge Economic Handbook* monographs. In conferring on Friedman this position—which was once held by Keynes himself, and which Frank Hahn would fill in the 1972−1982 period—the university's economists may have regarded the appointment of an American as a coeditor as a necessary recognition of the postwar shift of the center of economic research from the United Kingdom to the United States.[114] In this connection, Friedman and his fellow editor themselves referred to the "change to Anglo-American editorship."[115] Furthermore, during Friedman's tenure the U.S. editions of contributions to the *Handbook* were published by The University of Chicago Press, with a house advertisement describing the series as one that "brings the best minds in American as well as British economics to focus on the most crucial theoretical aspects of economic science."[116]

A factor that had likely worked in favor in Friedman's attainment of this position was his admiration for Alfred Marshall. For Friedman's coeditor on the series, C.W. Guillebaud, was Marshall's nephew. In his writings of the late 1930s, Guillebaud defended Marshall from

[113] Samuelson himself observed in mid-1969: "The central issue that is debated these days in connection with macroeconomics is the doctrine of monetarism." (Samuelson, 1969, p. 7.)
[114] Friedman himself would discuss this shift on a number of occasions, including in Instructional Dynamics Economics Cassette Tape 17 (March 1969). A list of the successive editors of the *Handbook* series appeared in Gale (1982, p. ii). A difference between Friedman's tenure and that of Keynes and Hahn was that each of the latter two served as sole editor, rather than coeditor.
[115] Guillebard and Friedman (1957, p. vi).
[116] See University of Chicago Press (1964).

accusations of error, as Friedman would a decade later.[117] Another relevant factor was that many economists at Cambridge University admired Friedman's consumption work, which he had worked on during his fellowship at the university in the 1953/1954 academic year and had presented at a number of venues in the United Kingdom during that year.[118]

On economic subjects other than the consumption function, Cambridge University economists may also have felt that Friedman was someone with whom they could have amicable disagreement. Later, however, the disagreement between Friedman and key economists from Cambridge University became far from amicable. His relations with key Cambridge University figures would rapidly deteriorate at the start of the 1970s, a development marked by the appearance in 1970 of sharp critiques of Friedman's monetary economics by both Kaldor and Robinson.[119] Indeed, starting essentially at this point, it would rapidly become clear that, from the perspective of the leading economists of Cambridge University, Friedman was *the* principal adversary—a situation that made Friedman's 1956−1966 service as part of Cambridge University Press's economics editorial team all the more incongruous in retrospect.[120] Nicholas Kaldor, with whom Friedman had been friendly in the 1950s, would emerge as an especially prominent U.K. critic of Friedman and monetarism.[121]

Friedman himself made clear his own posture toward Cambridge University in January 1977

---

[117] See Guillebaud (1937a, 1937b).
[118] As noted in Nelson (2020a, Chapter 3), Cambridge University's Nicholas Kaldor was an exponent of a version of the permanent income hypothesis. David Newbery, a student at Cambridge University in the mid-1960s, recalled the permanent income hypothesis being taught in a favorable light in economics classes. (David Newbery, interview, October 10, 2014.) By that stage, the university's department included Frank Hahn, who would go on record about his admiration for *The Theory of the Consumption Function* (see Hahn, 1990b). The fact that Friedman presented his consumption-function work in seminar appearances around the United Kingdom in the 1953/1954 academic year was recalled by Alan Walters, who saw one such presentation, in conversation with the author (May 11, 2002).
[119] See Kaldor (1970) and Robinson (1970).
[120] Although a detailed discussion of the U.K. version of the Keynesian-monetarist debates is outside the scope of this book, one notable feature of that debate that deserves mention here is that Friedman galvanized key Cambridge University economists into uniting against him. For, while Frank Hahn and James Meade were more sympathetic with the MIT side of the Cambridge-vs.-Cambridge debate than they were with Joan Robinson's position, the 1970s and 1980s saw Hahn and Meade figure, like Kaldor and Robinson, as major U.K. opponents of monetarism. As discussed in Chapter 1 above, Hahn (1971) essentially began hostilities with Friedman via an extremely negative review of *The Optimum Quantity of Money*. Friedman was affronted by the review and promptly ended his annual practice of sending Hahn a Christmas card. In recalling Hahn's review and Hahn's recounting to Sargent of Friedman's reaction, Thomas Sargent (interview, March 26, 2014) noted that Friedman's discussion of natural-rate and other theoretical issues, as manifested in the new and reprinted chapters in the book, "was loose, so, Friedman was making a guess about outcomes from some models which he hadn't quite written down. But it was a pretty damn good guess. (*laughter*) And Hahn wasn't flexible enough to notice that, so he just jumped on him."
[121] See Nelson (2009a, 2009b) for a detailed account.

when he joked that one should expect a wait of a quarter-century before a Cambridge University economics professor acknowledged an error in their analysis.[122]

The latter-day relationship between Friedman and key Cambridge University economists was evident in 1977 not only in this remark and the aforementioned contents of the *Cambridge Journal of Economics*, but also in a a sharp exchange of letters on the causes of inflation that Friedman and Kaldor had in the London *Times* (see Nelson, 2009a, p. 99). In the same year, Rose Friedman observed: "Those of us who came out of there [the University of Chicago] did not pick up the Keynesian philosophy, [so] we didn't have the same attitudes as they did at both Cambridges." (*The Anchorage Times* (Alaska), June 10, 1977.)

Against this background, it might be expected that Milton Friedman's reaction to the Cambridge-vs.-Cambridge debate would be a desire that both sides lose. Such an expectation, however, would be misplaced: Friedman was firmly on the U.S. Cambridge side of the debate. For one thing, he held the key figures at MIT in higher esteem than he did their counterparts at Cambridge University. Friedman clearly, if condescendingly, conveyed this judgment in 1969 when, after offering his generalization (noted in Chapter 6 above) that what was received wisdom about monetary policy at the University of Chicago in one year became received wisdom at Cambridge, USA, five years later, he added the further generalization the same wisdom only became accepted in Cambridge, United Kingdom, only after an additional several years' lag (Instructional Dynamics Economics Cassette Tape 17, March 1969).

On top of his more favorable attitude toward the economic viewpoints at MIT than those at Cambridge University, there were several specific considerations involving economic substance that made Friedman favor the economic analysis on the U.S. side of the reswitching debate. One of these was that Friedman's position that economic growth was determined by real factors and was enhanced by reliance on market mechanisms put him very much on the U.S. end of the debate. The MIT side of the two-Cambridges debate was taking a stand in defense of the validity and coherence of neoclassical models derived from optimizing behavior, and so that side was upholding an approach to economics that Friedman largely endorsed.[123] The U.K. critique of those models, in turn, was seen as pointing toward the desirability of less reliance on market

[122] Friedman (1977j, p. 3). This remark opened an evening talk, also available today in downloadable audio form, that Friedman gave to the Hoover Institution's conference on income distribution on January 28, 1977.
[123] Eatwell (1983) drew a more explicit connection between Friedman's economics and the issues in the reswitching debate, arguing that Friedman's natural-rate-of-unemployment concept became invalid if the Cambridge University economists' critique of neoclassical models was accepted.

mechanisms and greater governmental intervention in the investment process.[124]

In addition, Friedman had a stake in a specific aspect of the debate—the component of the debate that occasioned Bernanke (1987, p. 203), Jorgenson (1995, p. 7), Lucas (1988b, p. 36), and Paul Romer (2015) to refer to it. This was the issue—already alluded to above—of whether it was legitimate to use the concept of an aggregate capital stock in macroeconomic analysis, or whether, instead, the heterogeneity of capital equipment across firms and sectors rendered the concept of an aggregate capital stock inadmissible.[125]

This matter had been a central concern even in the earliest published contributions in the debate, such as Robinson (1956) and Solow (1955). The Cambridge University side of the debate denied that the aggregate capital stock was a viable concept.[126] The MIT side of the debate, in contrast, embraced analyses in which the concept of an aggregate capital stock was used. As one of the workers with Simon Kuznets on the formation of national accounts aggregates, Friedman was firmly aligned with the MIT side of this divide.[127] In 1970, Friedman matter-of-factly reaffirmed the validity of an aggregate-capital-stock concept, observing that in an analysis of aggregate output behavior over long periods, "the capital stock would have to be included and treated as an

---

[124] That the MIT side of the debate was one that seemed to lend itself to more market-oriented policies than did the arguments associated with the Cambridge University side was noted by Harcourt (1972, p. 3) and Mirrlees (1973, p. p. xvii).

[125] The discussion that follows focuses on this issue, rather than the matter of reswitching. The latter was of course a very important aspect of the debate, but it was not an aspect to which Friedman's body of work had much connection.

[126] An example of a statement on this point by the Cambridge University side was Kaldor and Mirrlees' (1962, p. 174) contention that "under continuous technical progress and obsolescence, there is no way of measuring the 'stock of capital.'" Samuelson (1970, pp. 734–735) pointed to the issue as one on which Kaldor and Joan Robinson were united in their disputes with neoclassical economists.

Kaldor had also been involved in the *previous* generation's debates on capital theory—notably a debate centered on the views of Frank Knight. In this earlier period, Kaldor had some interaction with Friedman on the matter. This interaction was reflected in Kaldor's (1937, p. 208) observation: "I am indebted to Mr. Milton Friedman, of the National Resources Committee, Washington, for helping me to understand Knight's argument..."

[127] Robert Solow invoked Kuznets' construction of estimates of the aggregate capital stock when teaching at Oxford University in the 1968/1969 academic year. Solow presented a version of lectures on economic growth that would subsequently be presented at Warwick University and published as Solow (1970). In his Oxford University lectures, Solow, lightheartedly alluding to the Cambridge-vs.-Cambridge debate, stated that K in the production function could be regarded as standing for "Kuznets," observing that whatever Kuznets meant by K, that was what Solow meant. (Christopher Gilbert, interview, November 21, 2014, and personal communication, January 19, 2015.) Kuznets' work on national accounts had long been tied to an acceptance of the notion of an aggregate capital stock, and some of this work put a spotlight on capital-stock estimates—notably the Kuznets (1937, 1939) studies undertaken when Friedman was his assistant. However, Kuznets' primary study of the U.S. economy's capital stock was one of his later works, Kuznets (1961), which Friedman and Schwartz (1963b, p. 54; 1982, p. 602) would cite.

endogenous variable, presumably defined by an integral of past investment."[128]

The question of the viability of the notion of an aggregate capital stock went hand-in-hand with that of the validity of the aggregate-production-function concept. And, in defending the latter concept, Robert Solow made arguments that put him very close to the Friedman outlook on methodology. In particular, Solow (1966b, pp. 1259–1260) observed: "I have never thought of the macroeconomic production function as a rigorously justifiable concept. In my mind it is either an illuminating parable, or else a mere device for handling data, to be used so long as it gives good empirical results, and to be abandoned as soon as it doesn't, or as soon as something better comes along."[129] Duncan Foley, a junior MIT department member starting around the time this Solow article appeared, observed of Solow, "he has a tremendous theoretical intuition. His philosophy of theorizing is not to go for any kind of general models, or general point of view, like general equilibrium. It's to make very specific models of very specific kinds of problems. And I don't remember much challenge [from Solow] to Friedman's point of view at the level of methodology." (Duncan Foley, interview, October 2, 2014.) Solow confirmed that "I thought there was a lot of sense in Milton's methodology"—while adding: "I think—and this was a tendency Milton had—he pushed it too far." (Robert Solow, interview, December 2, 2013.)[130]

Prior to the appearance in print of Solow's just-quoted defense of aggregate production functions, Paul Samuelson had sketched Solow's position on the matter—doing so in an article (Samuelson, 1962b) that has sometimes been viewed as the paper that really put the reswitching debate into high gear (see Jorgenson, 1995, p. 7). In the same article, Samuelson himself also endorsed the treatment of the aggregate production function as a parable, or empirical approximation, observing (Samuelson, 1962b, p. 193): "It is the case, I believe, that Robert

---

[128] Friedman (1970a, p. 218). Likewise, in Friedman (1966d, pp. 80–81), he had indicated that in some contexts it was desirable to treat consumption and capital goods as different, but he took for granted the validity of aggregating capital equipment into a single good.

[129] Consistent with Solow's 1966 account of his longstanding position, in 1955 he had written: "For many purposes it is remarkably useful to assume that there exists only one physical commodity which can either be consumed or used as capital in the production of more of itself." (Solow, 1955, p. 101.)

[130] Solow elaborated: "And in particular, the part of positive economics, in Milton's terms, that struck me as way too far was the notion that you really don't have to bother discussing the realism of assumptions—that the only thing that matters is the implications of the theory, not its assumptions. And I think that that's both logically and practically silly, nonsense; in fact, wrong, in the sense that the assumptions of a theory are among its implications, so, logically speaking, if you're testing all the implications, you will be testing the assumptions. And secondly, there are implications of any theory that are so close to the assumptions, that if they go wrong, if they're contradicted, the assumptions are *de facto* contradicted. If they're confirmed, the assumptions are *de facto* confirmed." (Robert Solow, interview, December 2, 2013.) Solow was also highly critical of some of the analogies and examples Friedman cited in support of his methodology, in particular the one involving leaves and sunlight. (Robert Solow, interviews, December 2 and 31, 2013.) (See Friedman, 1953b, p. 20.)

Solow and I have pretty much the same general views in this matter, having arrived independently and together at the same general conclusions."

Samuelson's endorsement, in the context of production-function analysis, of a position on aggregation that closely corresponded to that espoused by Friedman in his 1953 methodology article, contrasted somewhat with his opposition to Friedman's methodological position in other contexts (such as Samuelson, 1963, 1983b). It may be that the notion of the aggregate production function as an approximation found favor with Samuelson because it allowed for structural macroeconomic modeling, and that his main reservations about the Friedman methodology pertained to instances in which it was used to justify reduced-form modeling. In any event, both Samuelson and Solow invoked a Friedman-style defense of the procedure of using the concept of an aggregate production function.[131] Little wonder, that in a 1970 conference in Israel that concerned itself heavily with the reswitching debate, the approach of postulating the existence of an aggregate production function was described as "Friedmanesque" (Mirrlees and Stern, 1973, p. 355).

Although it is clear that Friedman's sympathies were with the MIT side of the Cambridge-vs-Cambridge debate, and notwithstanding his hopes to write more on capital theory at some stage, Friedman sat out the debate.[132] "Which I think was an act of wisdom on his part," Robert Solow observed (interview, December 2, 2013).[133] This judgment was shared by Victoria Chick, who, from her position in the U.K. academic scene, also stuck to monetary research. Chick avoided the capital theory debate because "if it captured you, you were really snared for years." With respect to Friedman, Chick remarked: "He didn't get into it, and he was wise not to, I think. As I say, it can swallow you up." (Victoria Chick, interview, January 13, 2015.)[134]

---

[131] In a later contribution, in a paper marking the 1976 passing of his one-time University of Chicago teacher Paul Douglas, Samuelson implied that the Chicago School had a stake in the Cambridge-versus-Cambridge debate because the side consisting of "Kaldor and neo-Keynesians" had challenged empirical evidence in favor of the Cobb-Douglas production function (Samuelson, 1979, p. 936).

[132] He did make in print what was, in effect, a minor acknowledgment of the existence of the debate in 1972 when adding "(England)" for clarification after referring to "Cambridge" (see Friedman, 1972a, p. 936).

[133] Edwin Burmeister, whose graduate work at MIT and subsequent career would include heavy involvement in the Cambridge-vs.-Cambridge debate, observed: "I don't think people at Chicago had much interest in that. Milton didn't. The only person who really had much interest in it was Jim Heckman." Asked to account for Heckman's interest in the debate, Burmeister's answer was straightforward: "he's interested in *everything*." (Edwin Burmeister, interview, November 20, 2014.) Earlier, when visiting the University of Chicago in the early 1960s, Joan Robinson had attempted with little success to get the university's economists, including Friedman, excited by the controversy (David Laidler, personal communication, September 28, 2015). See also Silk (1976, p. 52) on this visit.

[134] By focusing on matters concerning aggregation of the production function and of the capital stock, the preceding discussion has not covered in detail the "reswitching" property of production functions (the notion that there might be widely differing levels of output at which a particular combination of productive inputs is the profit-maximizing

Travel, bases, and publications

Although he was now a Californian, at certain points during 1977–1978 Friedman was in fact in fairly close physical proximity to Cambridge University in the United Kingdom, and at other points during the same years to Cambridge, Massachusetts. He made trips to the United Kingdom in September 1977 in November 1978, for appointments in London, as well as a visit in April 1978 that was centered on a talk Friedman gave in Scotland.[135] And he was in New England for extended periods in both 1977 and 1978, owing to the fact that he and Rose Friedman continued, in the initial years after their January 1977 relocation to San Francisco, to have a home in Vermont and to use it as their base for much of the spring and summer period. Consequently, during the mid- to late April 1977 period he and Rose Friedman taped a commentary, for his Instructional Dynamics Economics Cassette series, while staying in Vermont (Instructional Dynamics Economics Cassette Tape 211, April 1977, Part 1). The Friedmans were still in Vermont in early May and in the early days of June.[136] Their schedule involved them spending further time there in July (*The Anchorage Times* (Alaska), June 10, 1977). Likewise, the Friedmans were located in Vermont during May and June 1978 (*Los Angeles Times*, May 15, 1978, p. 3; *Omaha World Herald* (Nebraska), June 19, 1978; *Human Behavior*, November 1978, pp. 26, 30).

The Friedmans interspersed their time in Vermont and San Francisco with numerous trips to other parts of the country. Some of the better-publicized trips occurred in 1978—those, discussed in the next section, in connection with the tax-limitation movement. Among their

---

one, when another combination is profit-maximizing in the case of intermediate levels of output). The Cambridge University side of the debate often regarded Samuelson's (1966) acknowledgment (following his prior expressions of doubts), in a *Quarterly Journal of Economics* symposium, that reswitching could occur, as having been a devastating concession on his part. Eatwell (1982, p. 45), for example, stated that the 1966 exchanges "culminated in an admission by the high priest of orthodoxy, Paul Samuelson, that … something is logically wrong with neoclassical theory." On the U.S. side, however, Burmeister (1980, pp. 130, 154) and Robert Solow (in *Times Literary Supplement* (London), March 14, 1975) suggested that cases of reswitching had little bearing on the applicability of standard neoclassical analysis of the production process." The successes on some counts of the U.K. side of the debate, along with U.S. economists' predominant view that reswitching could be accommodated in the standard framework, were reflected in Clark's (1987, p. 107) observation: "The smoke has disappeared from the battlefields of the Cambridge on capital theory, but the reasons for the conflict have not evaporated, nor have textbook expositions of the neoclassical parables been radically altered."

[135] With regard to these trips, see *The Listener* (London), April 27, 1978 (a record of a talk, broadcast in the United Kingdom and delivered at Strathclyde University Business School, Glasgow, Scotland: on this talk, see also Valentine, 1987, p. 545, and Friedman, 1978h), Friedman and Friedman (1998, p. 476), and Moore (2013, p. 351).

[136] See Friedman and Friedman (1998, p. 473) on the Friedmans being in Vermont in early May. See also the Vermont dateline in Friedman's (1978g) preface dated May 2, 1977. On Friedman's continued stay in Vermont in June, see *Philadelphia Inquirer*, June 3, 1977.

other travels within the United States was one to the state of Alaska in June 1977. This trip, the Friedmans' first trip to Alaska (*The Anchorage Times* (Alaska), June 10, 1977), featured a talk by Friedman, delivered on June 9, on both current economic issues and longer-term ones (including Friedman's observation—one perhaps actually better suited to a mainland U.S. audience—that "this country had the good fortune of having two oceans fall on each side of us").[137] Other travels included visits in February 1977 to Malibu and Los Angeles in California and to Reno, Nevada; to Dallas for a talk on April 2, 1977 (Valentine, 1987, p. 544); and a further trip to Los Angeles in November 1977.

Prior to the last of these visits, Friedman had begun what would turn out to be over a dozen speaking engagements in various parts of the country over an eight-month period starting in September 1977.[138] These talks would be for the *Milton Friedman Speaks* series. This series was initially conceived as being, in their videotaped form, the basis for a television series—an idea abandoned by the late 1978 in favor of the *Free To Choose* series, made in 1979–1980 and discussed in the next two chapters.[139] One of the talks in the series involved a return on Friedman's part to the University of Chicago for a public lecture, dealing mainly with the workings of the price system, on October 3.[140] Although Friedman arrived at these events mostly through air travel, he indulged his fondness for driving when it came to arriving in Logan, the city in which he had a speaking engagement at Utah State University.[141] The Friedmans reached Utah by spending two days driving through the Middle Far West of the United States, including the states of Nebraska and Wyoming.[142]

---

[137] Friedman (1977e, p. 9). On the specific date of this event, see Valentine (1987, p. 545).
[138] For the list of engagements, see Friedman and Friedman (1998, p. 604).
[139] Friedman and Friedman (1998, p. 473).
[140] *Milton Friedman Speaks*, Episode 1, "What Is America?," taped October 3, 1977.
[141] The speech was on October 13, 1977. See Friedman and Friedman (1998, p. 604) and *Student Life* (Logan, Utah), October 14, 1977, p. 1.
[142] See *Milton Friedman Speaks*, Episode 2, "Myths That Conceal Reality," taped October 13, 1977, p. 26 of transcript. The meal stops on road trips like this could be a source of exasperation for Rose Friedman. James Friedman, having become a full professor in 1972, observed in the *Journal of Political Economy* in late 1976 that "those with a disposition to become professors also have a disposition to like such things as… varied food." (J.W. Friedman, 1976, p. 1374.) This was an attribute that Rose Friedman likely felt was lacking in Professor Milton Friedman. Gloria Valentine noted that "Professor Friedman liked junk food" and observed that, in recalling their pre-1977 travel routine to Valentine, "Mrs. Friedman mentioned that when they traveled between Chicago and Vermont, that there were nice restaurants that she wanted to stop in, but he stopped [instead] at McDonalds. He preferred [going to] McDonalds, or Burger King, or Kentucky Fried Chicken." Later, when working at the Hoover Institution, Friedman took note of the McDonalds located at the Stanford shopping center. On one occasion, a number of colleagues stopped by Friedman's office at the Hoover Institution, and "they were going out to lunch. Later, I found out that they had to go to McDonalds, because that's where Professor Friedman wanted to go. (*laughter*)." (Gloria Valentine, interview, December 5, 2013.)

Visits to Continental Europe also characterized these years. They included a brief trip to the Netherlands, one made so that Friedman could give an address at a Mont Pelerin meeting in Amsterdam on April 15, 1977.[143] Later, starting around mid-June 1977, the Friedmans went on several weeks of international travel that, though culminating in a visit to Israel, started off with trips to Switzerland and Scandinavian countries (*The Anchorage Times* (Alaska), June 10, 1977). This itinerary included a return to Sweden little more than six months after Friedman's Nobel lecture, with his new visit involving a delivery of his "Future of Capitalism" setpiece speech to the Federation of Swedish Industries. Friedman also visited Denmark, in a trip that included an engagement at a meeting of the Danish Economic Association.[144]

Although Friedman had put time into working on issues facing Continental Europe when he was there in 1950, he had done little to consolidate those early ties, and Niels Thygesen, Friedman's host in Denmark, recalled: "Friedman didn't have many links in Europe. He came here, of course, occasionally… [including] to my country, because at the time he got the Nobel Prize he was invited, [and] in several other places in Europe. But he was never there for long."[145] Thygesen noted that "I had met Friedman briefly in the United States a couple of times, I think, at the American Economic Association meetings in the 1960s, but the first time I really met him" was during the Denmark trip of 1977. "We had invited him to Copenhagen, and he came here, not exactly at the time of the Nobel Prize, but the following year. And then I had, of course, some discussions with him." The topics they discussed included the content of Thygesen's (1977) article "The Scientific Contributions of Milton Friedman." The *Scandinavian Journal of Economics*, a journal closely linked to the formal process of the Nobel economics award, followed a practice of publishing materials connected with each year's winner, including a commissioned article on the laureate's contributions. By the time of their meeting, Thygesen's article on Friedman was already in print, and Thygesen recalled that, in their discussion, "he was not particularly complimentary about my piece (*laughter*)… He thought there were a couple of errors in it—I don't remember how significant they were. I thought he overdid it a bit—Friedman was not a very generous man. He would tell you, straight away, if there was even a small detail that he didn't agree with. But I had a nice couple of days with him." (Niels Thygesen, interview, February 10, 2015.) This had indeed been the case of overreaction on the part of Friedman, whose work and positions Thygesen had skillfully encapsulated in his article.

---

[143] See Friedman (1984f, p. 42). This event took place just after Friedman completed his time as a visitor to the Federal Reserve Bank of San Francisco. See *Oakland Tribune* (California), April 18, 1977, p. 12.
[144] For more details concerning this event, see Chapter 7 above.
[145] Friedman eventually did make longer trips to Continental Europe in 1990 and 1997.

With the Nobel lecture set for the *Journal of Political Economy*, Friedman did not offer it to the *Scandinavian Journal of Economics*. That journal did publish in late 1977 his article "Time Perspective in Demand for Money," in late 1977.[146] This was a light revision of a 1972 manuscript. It was Friedman's final paper in monetary economics to be mainly theoretical in content, and it was also the last paper he published in the 1970s in an economic-research journal.

With regard to another outlet for Friedman's research, a news report that appeared just after he moved to San Francisco stated: "The economist, who has written almost 20 books, is now busy on another." (*San Francisco Examiner*, January 5, 1977.) This was his *Monetary Trends* with Anna Schwartz. This book remained unfinished over the 1977−1978 period, although progress toward completion took place in those years. "What do I do?" Friedman asked himself in the spring of 1977, before answering: "What I always do—writing, thinking on problems connected with the field of money and the operation of monetary policy." (*Oakland Tribune* (California), April 18, 1977, p. 12.)

The impression of a new book on monetary matters actually appearing in 1977 was created a few months later by Hobart Rowen's observation during the summer that "Friedman, in a new book, talks of 'decades' of simultaneously rising inflation and unemployment." (*Washington Post*, July 24, 1977, p. G1.) The book in question, however, consisted simply of the issuance by London's Institute of Economic Affairs in pamphlet form of Friedman's Nobel lecture, already published in the USA as an article in the June 1977 issue of the *Journal of Political Economy*.[147]

The U.K. reprint of Friedman's Nobel lecture was subtitled *The New Dimension of Politics*, and, in some retrospectives that appeared in the years that followed, it was indeed the political or policy-formulation aspects of the lecture that came to be seen as foreshadowing future developments in monetary analysis. Bernanke (2006b, p. 4) suggested that "Milton Friedman once again was in the vanguard on this issue." "Friedman laid out the modern argument" for price stability, Bernanke contended, by supplementing the argument that Phillips-curve dynamics meant that the output gap would revert to zero irrespective of the inflation rate with renewed stress on the damage to aggregate supply arising from high inflation. In this way, Friedman had made the case for orienting monetary policy toward the achievement of zero, or low single-digit,

---

[146] See Friedman (1977b).

[147] See Friedman (1977p). Another Friedman pamphlet-book had been published by the Institute of Economic Affairs (IEA) at the start of 1977. This item—Friedman (1977i)—consisted of his talks in London in August-September 1976 on Kenneth Galbraith's economics and on proposals to move toward smaller government. Material in this book was discussed in Chapter 6, and further coverage of it appears in the next chapter.

inflation, in addition providing impetus to research on the losses in potential output that were associated with high inflation—so that, Bernanke concluded, "by the late 1970s, even economists who were not part of Friedman's monetarist circle were beginning to study and acknowledge the costs to the economy associated with high inflation."

And with regard to the appropriate policy arrangements, Thomas Havrilesky, a longtime U.S. monetary economist, saw the longer-term message of Friedman's monetary work and the 1970s literature as being of a piece. Havrilesky recounted in 1995: "Milton Friedman about 40 years ago and intensified by the rational expectations revolution in the 1970s and 1980s, and supported by recent empirical work, a stream of economic research indicates that insulating the central bank from political pressure will improve inflation performance."[148] Havrilesky's characterization elided Friedman's own opposition to central bank independence. But it is true that both Friedman's 1977-published lecture and his early work were amenable to arrangements that isolated monetary policy from short-term political pressures—with Friedman's particular prescription involving the assignment to the central bank of a policy rule attuned to price stability.

Another article regarded in retrospect as impressing upon economists the case for central bank independence was one that appeared immediately after Friedman's in the June 1977 issue of the *Journal of Political Economy*: Finn E. Kydland and Edward C. Prescott's (1977) "Rules Rather Than Discretion: The Inconsistency of Optimal Plans." As its title suggested, this article pointed specifically toward the desirability of price-stability-oriented policy rules rather than recommending central bank independence *per se*. The subsequent literature, however, came to see central bank independence as conducive to avoidance of the scenario of a long-run inflationary policy that Kydland and Prescott had derived. Indeed, in a twentieth-anniversary retrospective on Friedman's Nobel lecture, Carl Walsh would argue that "Friedman was amazingly prescient" in his lecture—Walsh's grounds being that Kydland and Prescott (1977) had been in the spirit of the call Friedman had made in his Nobel lecture for better positive economic analysis of policymaking in order to understand why inflationary outcomes arose.[149]

As it happened, Kydland and Prescott (1977) departed from what Friedman had in mind in his Nobel lecture, as they postulated that the central bank aimed to maximize social welfare by pursuing economic aims. Friedman, in contrast, had become enamored of the public-choice

[148] March 16, 1995, testimony, in Joint Economic Committee (1995, p. 48).
[149] Walsh (1997, p. 1; p. 220 of printed version).

approach—which implied, as he acknowledged, a "more cynical" perspective on policymakers than that associated with an approach based on social welfare maximization (*Financial Times* (London), January 6, 1977), with a focus on shorter-term and special-interest political pressure rather than economic tradeoffs.[150] In addition, Kydland and Prescott held that the monetary authority purposely sought a positive output gap, whereas Friedman did not ascribe such an overemployment aim to policymakers when analyzing hypothetical or historical policies.[151]

There was, however, an important aspect that the Kydland-Prescott and the public-choice approaches had in common—one that would seriously mar much of Friedman's policy analysis during the 1970s, especially in 1977 and 1978. They took policymakers as well informed about the structure of the economy and, particularly, the connection between their monetary actions and the behavior of inflation. Inflation was consequently seen as a deliberate choice by the authorities, and policymaker reluctance to restrict demand in the face of high inflation was seen as deliberate acquiescence to and encouragement of that inflation. These conclusions—valid enough analytically, when applied to the policymakers in the public-choice and Kydland-Prescott models of monetary policy decisions—were of very limited applicability in the understanding of the reasoning behind real-world, U.S. policymaker choices in the 1970s. Friedman's statements during the early Carter years underlined the difficulties involved in applying the public-choice literature's approach to actual policy.

Public-choice analysis—and applying it to Jimmy Carter

As the above discussion has suggested, the tone of Friedman's commentaries on current policy developments was uneven during 1977 and 1978. It had, basically, two major strands, and they were in conflict with one another.

As part of the *first* strand, Friedman made numerous commentaries—informed by his exposure to the largely-theoretical investigations of policymaking being made in economic research, notably those in the public-choice vein—that took for granted a consensus in policy circles that inflation was a monetary phenomenon. That is, policymakers *chose* inflation consciously and knew that disinflation entailed monetary restriction. In these commentaries, Friedman likewise tended to assume that there was wide agreement that a move to economically-liberal microeconomic policies would improve prospects for employment and economic growth in the

[150] On Friedman's interest in this literature, see the discussion that follows as well as Nelson (2020a, Chapter 9).
[151] See, for example, Nelson (2020a, Chapter 9; 2020b, Chapter 11) and the previous chapters of this volume.

medium and longer term. From the perspective of these commentaries, the principal obstacle to a major change in policy settings lay in perceived short-term political costs of the change.

The second strand of commentaries appeared over the same years of 1977 and 1978, but less frequently than the first. In this second strand, Friedman took both high inflation and the tendency for the federal government to engage in interventionist policies in specific sectors to be the result of officialdom's acceptance of a different economic model from his own (and, of course, an incorrect one). From this perspective, a doctrinal shift—effected by either an overhaul in the conceptual framework guiding existing policymakers, or a change in the personnel making policy in favor of those possessing a different conceptual framework—would likely be required to generate a major policy change. Recalculation of political costs of different policies would, these lines of thinking suggested, not be the primary reason for the change.

As will be seen, of the two interpretations of economic policy reflected in these different strands, it was the second that actually better captured policy decisions under President Jimmy Carter and the reasoning underlying his policies. Friedman's considerable reliance on the first, and flawed, interpretation of contemporary U.S. policymaking would lead him to numerous mispredictions of the direction in which Carter would go on economic policy during 1977 and 1978. These mispredictions were a corollary of the fact that Carter and his advisers really did adhere to an older economic framework, one that was largely antithetical to Friedman's.[152]

Crucially, Friedman overemphasized political, as opposed to economic, assessments as factors guiding the formulation of U.S. economic policy in the 1977−1978 period. Friedman's tone during Carter's time in office was set very early, in the January 1977 debate with Franco Modigliani discussed in the previous chapter, when he affirmed the need for a "positive science of politics."[153] He went on: "Franco, myself and all the rest of us have tended to follow the attitude: Well, now, what we need to do is to figure out the right thing. If only we can tell them what the right thing to do is, then there's no reason why able, well-meaning, well-intentioned people should not carry out those ideas." Yet, Friedman suggested, it was something other than the right policy that emerged in practice, and it wasn't "an accident that that happens. It happens for very systematic, explicit reasons."[154] Similarly, thirteen months later Friedman lamented the

[153] Friedman (1977d, p. 18).
[154] Friedman (1977d, p. 18).

lack of application until recently of economic research on "the political arena" that saw the participants as "pursuing their own interests" instead of social welfare.[155] And, as already indicated, his Nobel lecture of December 1976 had pointed to the need for such a research agenda, while also mentioning James Buchanan, Gordon Tullock, and Kenneth Arrow as among the authors who had already made headway on the subject matter.[156]

Friedman's interest in modeling policymakers along the lines of the public-choice literature impaired his own analysis of current policy developments. He was aware—indeed, he had talked at length on the subject—that, since 1970, U.S. policymakers had embraced nonmonetary views of inflation. He also knew, from his experience in the 1960s, that academic views on economic policy often took years to permeate policy circles: thus, officialdom in the Kennedy-Johnson years had given fiscal policy primacy over monetary policy at a time when academic work was proceeding apace at reversing the ranking. Friedman was also aware that, his influence notwithstanding, much influential economic opinion in U.S. academia remained different from his own, particularly in the area of policy prescriptions. Indeed, the lack of consensus in 1977 among macroeconomists on the right setting of stabilization policy was evidenced by his and Modigliani's different policy prescriptions in January 1977, and by the continued advocacy during the year of demand stimulation alongside incomes policy on the part of Okun, Tobin, and others.[157]

These considerations should have led Friedman to suspect that the White House and the Federal Reserve in the late 1970s would still be inclined to embrace nonmonetary views of inflation, even though the monetarist arguments against those views were coming to prevail (though were not yet the clear-cut winner) in academic discussions. The public-choice perspective, however, encouraged a line of thinking in which policymakers were assumed to understand the basic structure of the economy and optimized in light of that structure as well as the prevailing political pressures. That perspective tended to lead Friedman further toward a tendency he had already sporadically displayed in past discussions of Burns, Nixon, and Ford: to take for granted that policymakers understood that inflation was a monetary phenomenon.[158] In contrast, the

[156] Friedman (1977c, p. 460).
[157] See Chapters 5 and 7 above.
[158] Thus, in *Newsweek* (March 5, 1979), for example, he would write that "it has been politically profitable for the powers that be to produce inflation." Also noteworthy in this connection was Friedman's insistence in 1978 (see the previous chapter) that Secretary of the Treasury Blumenthal did *not* really believe in wage-push views of inflation.

record of U.S. policymakers' statements and actions suggested that such an acceptance had not actually taken place at all—either in the first half of the 1970s or in 1977–1978.

At the time of Jimmy Carter's inauguration in 1977, Friedman, believing that politicians had drawn the correct lessons from the economic problems of the first half of the decade, expected Carter to be led by his own long-term political interests to support restraint in aggregate demand. This view tended to make Friedman to be more optimistic about the likelihood that economic policy would progress rapidly toward a framework he favored. For it suggested that, if support for that framework came to prevail in public opinion, policymakers would tend to adopt it whatever their own feelings about its merits. In this vein, Friedman would cite examples of policymakers before the 1970s—including Winston Churchill, Dwight Eisenhower, and Lyndon Johnson—who came to office associated with particular positions on social or foreign policy yet had followed diametrically opposite policies on taking office.[159]

In the 1970s, Richard Nixon had provided another such example, this time in the area of economic policy, with his imposition of wage-price controls. Public opinion had, in the early 1970s, helped shift Nixon away from policies Friedman favored. Furthermore, President Nixon's post-1971 economic experience, Friedman believed, had helped teach politicians that expedient macroeconomic policies were no longer good politics.[160] Friedman declared in

---

[159] In February 1978, Friedman contrasted Churchill's opposition to dissolving the British empire with his acquiescence with that development as a postwar prime minister (*Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 33 of transcript). (See, however, A. Roberts, 2018, pp. 945, 950, for an argument that the United Kingdom's process of decolonization, although not reversed, was not formally extended to more countries during Churchill's 1951–1955 period in office. On that reading, Friedman's interpretation of Churchill's record was not strictly incorrect.) Earlier, in Instructional Dynamics Economics Cassette Tape 203 (November 1976, Part 2), Friedman had noted Eisenhower's warnings against the military-industrial complex as president despite his military background, Johnson's enaction of civil rights reforms despite his opposition as a legislator to earlier reforms in this vein, and President Nixon's extensive negotiations with China and the USSR, notwithstanding his reputation as being hardline on foreign policy. (For other discussions Friedman gave along the same lines, see *The Evening Bulletin* (Philadelphia), November 15, 1976, and *Milton Friedman Speaks*, Episode 2, Myths That Conceal Reality," taped October 13, 1977, p. 25 of transcript.) Friedman cited all these examples as evidence that experience in office often led policymakers to change their position, with trends in public opinion and the advice of staff in government often playing important roles in shaping the positions that policymakers took in office. (Friedman's view to this effect were also reflected in his assessments of the influence of economists' consensus on the policies of successive presidents—see Nelson, 2020a, Chapter 10)—and in his doubt that Barry Goldwater would have been able to enact his election campaign promises if elected—see Nelson, 2020b, Chapter 12.)

[160] In *Newsweek*, October 16, 1978, Friedman indicated that Nixon himself had acknowledged that imposing wage-price controls was a mistake. As he noted, this acknowledgment had appeared in the former president's newly published memoirs—see Nixon (1978, pp. 520–521)—from which Friedman drew his column title, "The Politics of Economics" (a phrase that appeared in Nixon, 1978, p. 522). Although Friedman was not mentioned in these memoirs, which appeared in May 1978, Friedman cited them in Friedman and Friedman (1998). In the United

November 1977 that he perceived a "very strongly detectable change in the attitudes of the public at large" in which both the government's role in producing inflation had become better understood and in which there was a greater willingness to take measures against it.[161]

In this light, and as indicated in the previous chapter, Friedman believed that Carter would not proceed with the traditional economic policies he had largely espoused during the 1976 election campaign. Indeed, as of early 1977 Friedman believed that it was "very likely" that there would be a recession in 1978 or 1979, and he reiterated his view that Carter wanted, or should want, such a recession (Instructional Dynamics Economics Cassette Tape 209, March 1977, Part 1). He expressed this judgment again in his speech in Alaska in June 1977.[162] A recession at such a point in Carter's term, Friedman believed, would leave the president able to go to the polls in 1980 in conditions of economic recovery and declining inflation.

Toward the end of Carter's second year in office, Friedman acknowledged that the president had only "occasionally" seemed to have shown interest in what Friedman saw as this enlightened intertemporal approach (*Newsweek*, September 18, 1978). Instead, especially in 1977, the president and other senior officials had shown faith in measures—stimulus packages to be enacted immediately and against the background of an economy well into recovery, encouragement of the holding-down of market interest rates, and incomes policies and related measures against inflation—that Friedman saw as delivering dubious short-term benefits, while increasing longer-term output instability and forfeiting the achievement of price stability.

Friedman had overestimated the resilience of the ideas concerning stabilization policy that had guided policy earlier in the 1960s. "We have followed very bad policies," he observed in 1978 (*Meet the Press*, NBC, November 12, 1978, p. 2 of transcript). But it took him well beyond 1978 to return definitively to his earlier position that "[b]ad economics makes bad policy" (*Newsweek*, May 12, 1975) and to the corollary that economic policy mistakes in the past had been guided by faulty economic analysis.

The contradictory pattern marking Friedman's interpretation of policy developments in

---

States, the memoirs were titled *RN: The Memoirs of Richard Nixon*. For the release of the book in the United Kingdom, however, the main title *RN* was dropped, as Nixon's initials were liable to be confused with the acronym for the Royal Navy. The citation of Nixon's book in Friedman and Friedman (1998, pp. 630, 646) used its U.K. title, rather than the *RN* title used by the American publisher they listed.

[161] *Milton Friedman Speaks*, Episode 6, "Money and Inflation," taped November 7, 1977, p. 27 of transcript.

[162] See Friedman (1977e, pp. 6–7).

1977–1978 was reflected in two different statements he made in a single interview—with NBC news in November 1978. On the one hand, he perceived "a very cheerful picture from the long run, because the real thing I think needs emphasis is that the American people are waking up to what the situation is, and they are going to make it politically profitable for the people in power to change policy in the right direction." (*Meet the Press*, NBC, November 12, 1978, p. 9 of transcript.) This statement was on the right track in foreshadowing a major policy change ahead but missed the fact that what would really drive the change was a doctrinal shift at the policymaker level.[163] On the other hand, in the same interview he stated: "I believe we are set on a road that is almost sure to lead to mandatory wage and price controls, probably early in 1980."[164] This statement was accurate in seeing that as of late 1978, policymakers' thinking about economic relationships was not too different from the thinking that had led to controls in 1971. But it was off-base in presupposing (as did his speculation during the same period that President Carter would impose foreign exchange controls) that the Carter Administration would be unwilling to countenance restriction of aggregate demand in the vicinity of a presidential election year. In fact, once finally persuaded that such restriction was necessary for disinflation, the administration went along with that direction of policy.

In the areas of microeconomic policy and the size of government, Friedman likewise fluctuated between the view that a move to economic liberalization would occur irrespective of the politicians in charge and one in which Carter was a strong major force in the opposite direction. As the United States entered the late 1970s, Friedman saw public opinion as a factor on his side. "Surely it is a healthy thing that the public at large should recognize the defects of governmental arrangements," Friedman said in a television commentary in May 1976. "That is an essential first step toward eliminating the failures—toward cutting the government down to size." (*CBS Morning News*, May 25, 1976, p. 6 of transcript.) Although, Friedman observed in November 1976, Carter had shown himself during the campaign to be a "fairly typical New Deal liberal" (Instructional Dynamics Economics Cassette Tape, 202, November 1976, Part 1), he envisioned circumstances in which Carter would follow policies contrary to New Deal precepts.

A good deal of Friedman's commentary during 1977 and 1978 was in this vein. In November 1977, he ventured to suggest that public-sector actions government were no longer seen as the natural way to address social problems.[165] "People are realizing that government projects are

[163] See especially the next chapter.

[165] *Milton Friedman Speaks*, Episode 6, "Money and Inflation," taped November 7, 1977, p. 27 of transcript.

backfiring," he added in December. "The calls for government solutions are declining." (*St. Louis Globe-Democrat*, December 16, 1977). He noted during 1978 that this shift was also occurring among some intellectuals and opinion leaders, such as the neoconservatives, who had a prior record of favoring government intervention.[166]

Yet the same years also saw expressions of pessimism on the part of Friedman regarding the prospect of a move to freer markets. In April 1977 he remarked, "I am innately optimistic, but my mind forces me to be pessimistic about the future of liberty and freedom," adding: "We are on a downgrade." (*Oakland Tribune* (California), April 18, 1977, p. 12.) And, disappointed by how economic policy took shape over 1977, he remarked early the following year: "The policy of the Carter Administration is a policy of continuing and extending governmental controls."[167] The administration's proposed changes to energy policy, discussed under the heading "James Schlesinger" in Section III below, likely formed the clinching evidence to Friedman of this tendency. In addition, the Carter Administration secured increases both in the minimum wage and in Social Security taxes in 1977–1978.[168]

Deregulation and inflation policy

A countercurrent over the same years was the interest that the Carter Administration displayed with regard to some aspects of deregulation. Most notably, Alfred E. Kahn, the Carter Administration's chairman of the Civil Aeronautics Board, facilitated the passage in 1978 of the Airline Deregulation Act (Baumol and Blinder, 1978, p. 501). At the time, Kahn was described in the press as "sometime professor in economics (of the Milton Friedman school of thought), current Chairman of CAB and ranking with Sir Freddie Laker as one of the leading figures of aviation today." (*Interavia*, October 1978, p. 920.)

But, having achieved acclaim in his work in the aviation area, Kahn was promptly moved by Carter into macroeconomic policy—an area in which Kahn, a passionate proponent of cost-push

[166] See Friedman (1978i), as well as Friedman (1978b, p. 20).
[167] *Milton Friedman Speaks*, Episode 15, "The Future of Our Free Society," taped February 21, 1978, p. 17 of transcript.
[168] President Carter signed, on November 1, 1977, a law introducing a phased increase in the minimum wage (Carruth, 1993, p. 733). With regard to the Social Security tax rate, Barro and Redlick (2009, p. 48) find that the average marginal rate rose in 1979, after five years of rough stability, from 4.3 to 6.8 percent, then to 7.2 percent in 1980 and 8.4 percent in 1981. Despite himself having presided over increases in Social Security taxes, President Ronald Reagan highlighted the Carter Administration's prior increases in those taxes. In his first televised debate with Democratic presidential candidate Walter Mondale, on October 7, 1984, Reagan referred to the "Social Security tax [increase] of '77"—which he labeled "huge."

ideas, was decidedly *not* of the Milton Friedman school of thought. Kahn was simultaneously given two posts—adviser to the president and chairman of the Council on Wage and Price Stability—with Carter proclaiming that Kahn would be "my new partner in controlling inflation in this country" (*Dallas Morning News*, October 26, 1978). Friedman lamented the development. Kahn, Friedman observed, had done "a remarkable job," producing "spectacular results" via his promotion of deregulation.[169] But the motivation to assign Kahn, who had no monetary policy authority, responsibilities supposedly associated with the control of inflation was misguided. In administering incomes policy, Friedman remarked, Kahn would henceforth actually act to "stifle the forces of the market," and insofar as Kahn invoked deregulation in the context of fighting inflation, he would be propounding something that was "sheer delusion" (*Newsweek*, November 20, 1978).[170]

The administration's economic insularity

In this connection, it deserves emphasis that, to a very important extent, the Carter Administration economic team operated in a "bubble"—being resistant to, and in some ways oblivious to, the changes in thinking that Friedman had engendered in research circles. The Carter economic officials largely adhered to an economic framework closer to that of the Kennedy-Johnson Administration than that of best-practice macroeconomics of the late 1970s. Friedman complained (*Newsweek*, November 20, 1978) that the Carter Administration seemed to have learned nothing from history on economic matters—but it was also true that its team also appeared to have absorbed only a portion of the changes in professional thinking that Friedman had helped engender in economics over the preceding two decades.

Carter's advisers were, it is true, aware of the permanent income hypothesis and its warning against the effectiveness, in the management of aggregate demand, of fiscal policy-induced changes in transitory income. But, in making the case for the proposed 1977 tax rebate, Carter's

---

[169] *Newsweek*, November 20, 1978. See also Friedman and Friedman (1980, p. 200). Friedman had stressed the desirability of airline deregulation on a number of occasions, including in a talk in Detroit in early 1971 (*Detroit Free Press*, March 9, 1971). He would praise the 1978 deregulation as having given rise to lower prices and more air traffic and as having allowed airlines to act more like private-sector firms than they had previously, although he criticized the fact that U.S. airports remained government-run (see Friedman, 1989c, p. 571).

[170] Around the same time, Meltzer (1979, p. 1039) likewise referred to "the vulgar error of recommending deregulation or efficiency gains to reduce inflation." Correspondingly, in a retrospective assessment, Lawrence Summers has referred to the approach to anti-inflation policy dominant in the Carter Administration from October 1978 to the early summer of 1979 in the following terms: "The whole [']Alfred Kahn as inflation czar['] futility was about a foolish conflation between competition and inflation policy." (Lawrence H. Summers, twitter, December 26, 2021.)

economists argued in internal memoranda that the hypothesis' prediction had been refuted by experience earlier in the decade (see Biven, 2002, pp. 63−64). As far as another Friedman contribution—the natural rate hypothesis— was concerned, the CEA's Charles Schultze had observed the debates on the expectational Phillips curve at close hand by seeing empirical Phillips curves debated at successive panels of the Brookings Institution economics group. He came to regard the Friedman-Phelps side as having won the debate (see Schultze, 1996, p. 34) and his late-1970s statements confirmed his rejection of a simple Phillips curve.[171] But the implications for stabilization policy of a unitary coefficient on expected inflation in the Phillips curve were, in effect, nullified by the Carter Administration's predilection toward adherence to a strongly cost-push view of inflation.[172]

All told, the administration's first two-and-a-half years in office were characterized by economic views that rated fiscal policy higher in importance than monetary policy and that downplayed the significance of monetary policy for aggregate demand and inflation alike. "The inflation we are now experiencing has nothing to do with either the money supply or with government spending, according to Carter's advisers," was the hostile, but basically accurate, assessment of one political commentator (*Arizona Republic* (Phoenix), March 7, 1978), while Stuart Eizenstat, a domestic-policy adviser to Carter, would later concede that "[i]t took too long for the president's key economic advisers… to come to the realization that in a high-inflation environment, we had

---

[171] On May 14, 1976, Schultze had testified: "Most of the economics profession would agree that holding the rate of adult unemployment at 3 percent would lead to inflation. There is, within the profession, division of opinion about whether the resultant inflation would be high but steady rate or an ever-accelerating rate." (In Committee on Labor and Public Welfare, U.S. Senate, 1976, pp. 142−143.) Although this particular testimony did not arbitrate between the two views, Schultze subsequently indicated that he had himself rejected the simple-Phillips-curve view, when he stated that "pushing the unemployment down through 6 [percent]" via aggregate-demand policy would "in no way under present circumstances [be] likely to speed up the rate of inflation." (From pages 25 and 21, respectively, of his testimony of January 11, 1977, in Committee on Banking, Housing and Urban Affairs, U.S. Senate, 1977c.) This judgment entailed a rejection of the simple Phillips curve's implication that reducing the amount of slack in the economy implied (*ceteris paribus*) a higher inflation rate. In the same vein, on April 13, 1976, Schultze had remarked that economic expansion "could continue at a good clip to get you down to that level of unemployment [6 percent] without reaccelerating inflation." (In American Society of Newspaper Editors, 1976, p. 70.)

[172] This meant that the Carter Administration economists discounted the role of the output gap in the Phillips-curve equation and played up the role played by changes in the intercept and/or the disturbance term. See the preceding discussion, as well as the accounts in Chapters 5 (under "Arthur Okun") and 7 above. Taylor (1997) and Romer and Romer (2002b, pp. 60–63) were highly notable early discussions of the late-1970s U.S. policy atmosphere. Both these discussions appropriately stressed that the Carter Administration's suggestion that negative output gaps did not make for sizable disinflationary process and that this factor was an obstacle to a realization of the imperative of a fundamental shift in monetary policy before 1979.

Note, however, that this chapter's analysis specifically does *not* attribute a belief in a long-run Phillips-curve tradeoff to the Carter Administration's economic team. Such an attribution (made to them by Meltzer, 1981, p. 40, and Goutsmedt, 2022) is not consistent with the view that the Carter team actually espoused.

given too little emphasis to monetary policy."[173]

The state of affairs as of 1978 has been elegantly captured by Brad DeLong as reflecting "the intellectual gulf between Cambridge and Washington" on macroeconomics as of 1978. By "Cambridge," DeLong referred to the MIT-originated macroeconomics textbook of Dornbusch and Fischer (1978). As discussed in the previous chapter, the Dornbusch and Fischer textbook reflected the fact that, as DeLong put it, the "first Chicago School by and large won the day" , in new-generation macroeconomics textbooks of 1978. The first Chicago school of the 1970s, in DeLong's classification scheme, being the positive-economics component of Friedman's macroeconomics—in which monetary policy is central means by which the government can affect nominal aggregate demand and prices, and in which prices are sticky and the output effects of monetary policy dissipate only slowly—as distinct from what DeLong calls the "second Chicago School" of the Lucas rational-expectations work, prices are sticky and the output effects of monetary policy dissipate only slowly. In contrast to this Cambridge-U.S. younger-generation acceptance of Friedman's macroeconomics, the Washington economists influencing the Carter Administration largely adhered to a 1960s-style Keynesianism.[174]

The mindset in the Carter Administration was so tied to an older orthodoxy that, even though Jimmy Carter had shown a personal interest in Friedman's economic views when they got in contact at the end of 1976, his economic team seemed to ignore Friedman's public statements in the early years of the administration. For example, Eizenstat (2018, p. 279) asserts that in 1977 "the harsh medicine of recession… [in order] to lower inflation.... was a policy that no one advised, inside or outside the administration." But, as we have seen, by June 1977 Friedman was, in fact, offering this advice to the president from outside the administration.[175] And also in June 1977, the administration's William Nordhaus (working on energy policy) stated: "I think there are no advocates around, or very few, for complete decontrol of [prices of] old and new oil

---

[173] Eizenstat (2018, p. 352). Eizenstat goes on to state that the administration gave too much emphasis to fiscal policy in inflation control. Most of this overemphasis was in 1979, when it turned to fiscal policy restriction as a device against inflation. In 1977 and 1978, the administration gave heavy weight to fiscal policy's influence, but it did so in the context of trying to use stimulative fiscal policy to boost output.

[174] And even Dornbusch, despite considerable convergence to Friedman on analytical issues by 1978, was still differing sharply from Friedman in the early part of the year in his diagnosis of the U.S. economy—with Dornbusch seeing considerable slack and little chance that inflation would pick up. See the previous chapter.

[175] To be more specific: In early 1977, Friedman was urging a gradual economic recovery to take place in the context of a renewed slowing down in monetary growth (see the previous chapter). However, in mid-1977 he was indicating that a midterm recession might be in the president's interest, as that would likely provide a better set of economic conditions in the 1980 election year. By mid-1978, he regarded a recession in 1979 or 1980 as necessary in order to bring inflation down from the double-digit rates that he was already predicting.

and [of] gas."[176] In fact, the latest Nobel winner in economics—Friedman—had advocated that policy repeatedly, in his *Newsweek* column and elsewhere.

Ronald Reagan and the coming 1980 presidential contest

Nordhaus had also not mentioned Ronald Reagan, even though Reagan, too, was a prominent advocate of energy price decontrol.[177] Nordhaus may have regarded Reagan as no longer a major political figure, in light of his 1976 primary defeat at the hands of Gerald Ford.[178] As discussed in Chapter 5, following the November 1976 election Friedman, too, saw the Reagan presidential candidacy as something to be regarded as strictly being in the rear-view mirror. Consistent with this attitude, in the following year he emphasized factors different from specific candidates in hopes for achievement of a policy change. "It's nice to elect the right people, but that isn't the way you solve things," Friedman argued. "The way to solve things is by making it politically profitable for the wrong people to do the right things."[179] These remarks were a counterpart to the sentiment held by Friedman at the time, one noted above: that the introduction of policies he favored did not, and perhaps would not, have to wait for the ascendancy of policymakers who were naturally sympathetic to those policies.

But, as also indicated above, President Carter's adherence to largely interventionist policies was something that had to give Friedman pause in his downplaying of the identity of policymakers. Friedman's assessment had been faulty in a further respect: Reagan had not put presidential aspirations behind him. In an interview on *60 Minutes* a month after the election, Reagan contended that he could have won the election if he had been the GOP candidate.[180] In another television interview five months later, Reagan was asked: "In 1980, you will be 69 years old.

---

[176] From Nordhaus' testimony of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977a, p. 117).
[177] It was noted in the press during 1977: "Reagan has been an outspoken advocate of removing all federal price controls on oil and natural gas as a means of stimulating domestic energy production." (*Boston Herald American*, December 4, 1977. See also the discussion titled "James Schlesinger" in Section III below.) Friedman himself mentioned Reagan's support for energy-price decontrol in *Saturday Evening Post* (May/June 1977, p. 20) and in *Newsweek*, October 16, 1978.
[178] Thanks to his having defeated Reagan in 1976, former president Ford was as of 1977 was formally still the national leader of the Republican party.
[179] *Milton Friedman Speaks*, Episode 6, "Money and Inflation," taped November 7, 1977, p. 25 of transcript. Friedman had made a similar comment in his appearance on *The Open Mind*, PBS, May 31, 1977, pp. 14–15 of transcript, and in *Milton Friedman Speaks*, Episode 1, "What Is America?," taped October 3, 1977, p. 26 of transcript.
[180] See *Manchester Union Leader* (New Hampshire), December 6, 1976, and *Dallas Morning News*, December 9, 1976.

Are you washed up as a presidential candidate or a candidate for any other public office?" "I don't know," Reagan replied. "I have given no thought to 1980 in advance, and that would be up for the people to decide, if age is going to be a factor." (*Meet the Press*, NBC, May 1, 1977, p. 4 of transcript.) This reply understated the amount of preparation that Reagan was already engaged in. A retrospective two years later assessed that, in effect, "Reagan never stopped running for president" after 1976 (*Detroit Free Press*, March 15, 1979).[181]

Furthermore, the prospect of a successful campaign against Carter was improving. This development was contrary to expectations. Notwithstanding the fact that Carter's election victory in 1976 had proved to be narrow, he had entered office among widespread expectations that he would be reelected in 1980. At this early stage of his tenure, the damage to the Republican party arising from the Watergate scandal and the poor national economic performance of 1973–1975, combined with the tendency for incumbent presidents to be reelected, seemed to put Carter very much in the box seat when it came to securing a second term. Immediately after the 1976 election, *Time* magazine had noted that, although "the Republicans' fairly good showing in races for the Senate, House, and governorships gave them hope for the future," its next presidential victory was unlikely to be just four years away: "Probably not for 1980—unless Jimmy Carter turns out to be a singularly inept President, suffering foreign reversals, mismanaging the domestic economy, and defaulting on his many reform promises." (*Time* magazine, November 15, 1976.)

From the perspective of Friedman and many others, Carter's performance in office largely conformed to the negative scenario that *Time* had painted as a remote possibility. As noted earlier, Friedman saw merit (and longer-term electoral benefit) in a Carter default on some 1976 promises. But Friedman felt that Carter, to a large degree, did not actually depart sufficiently from his election-year economic stance. In particular, and notwithstanding his withdrawal of the tax-rebate proposal in April 1977, Carter continued to favor stimulative economic policies after the election and did so through late 1978.[182] And, separate from the issue of Carter's specific election promises, the overall tone emanating from his administration did little to consolidate his electoral support. Although it was the second half of Carter's term (1979 to 1981) that became remembered in retrospect as featuring the bulk of Carter's problems in foreign policy and

[181] In a similar vein, a November 1977 news report had been titled "Reagan Committee Is Staffed, Waiting" (*Milwaukee Journal*, November 29, 1977).
[182] See the previous chapter, as well as the discussion above of the Carter Administration's international-coordination initiatives.

economic policy alike, he had already had a steep decline in popularity over 1977 and 1978, and prospects for a 1980 Republican presidential victory heightened. Ronald Reagan's maintenance of a basic campaign organization after 1976 had therefore stood him in good stead.

As it happened, during 1977, though he indicated that "I earn my living out on the speaking circuit, doing a radio commentary and a once-a-week newspaper column" (*Meet the Press*, NBC, May 4, 1977, p. 4 of transcript), Reagan was for a time actually a nominal colleague to Friedman of sorts, as he had been named an honorary fellow at the Hoover Institution (*San Francisco Chronicle*, May 4, 1977). However, Reagan's appointment, and most of his activities in connection with it, occurred before Friedman really took up his own Hoover Institution post in the fall of 1977. Reagan did not live in the Bay Area, and he had an assigned office at the Hoover Institution only fleetingly.[183] Friedman therefore saw little of Reagan in the year after the 1976 presidential election and was not privy to the former governor's enduring presidential ambitions. This situation began to change on November 6, 1977, when Friedman and Reagan both attended an evening awards ceremony in Los Angeles (*Los Angeles Times*, November 7, 1977). At the event, the Friedmans were struck by the response generated by a throwaway remark by Milton Friedman about the failure of Ronald Reagan's 1976 presidential bid. Nancy Reagan's reaction, in particular, made the Friedmans aware of the resilience of the Reagans' White House ambitions, and it pointed toward the likelihood that there would be a new Reagan campaign in 1980.[184]

II. ISSUES RELATED TO DEBATES ON REGULATION AND AGGREGATE SUPPLY, 1977–1978

THE TAX REVOLT

In late 1977, Ronald Reagan was quoted as saying that the Republican party now had "the best issue we've had in a long time—and it's one on which a majority of working Americans will agree with us. The issue is taxes." (*Kansas City Star* (Missouri), December 18, 1977.) Reagan had accurately identified a policy area—that of tax cuts—that would figure heavily in his campaign for president in 1980 and even more so among the economic policy steps taken during his presidency starting in 1981. For the immediate year ahead of 1978, however, neither Reagan

---

[183] Martin Anderson recalled that Reagan "had an office there [only] for a short period of time." (*Booknotes*, CSPAN, August 16, 1992.)
[184] See Friedman and Friedman (1998, p. 389).

nor the contest for president in 1980 dominated the terms of the U.S. debate on taxes. This debate instead proceeded primarily in the areas of state politics and Congressional exchanges. Each of these areas was marked by a standout development in 1978, on which discussion was centered.

As far as state politics was concerned, the major development was on June 6: the Californian electorate's passage by referendum—following a multi-month election-style campaign on both sides of the debate—of "Proposition 13." This measure capped the property tax rate at 1 percent of the value of a house, while limiting the amount by which the property's assessed value could be raised in any year (*Columbus Dispatch* (Ohio), June 15, 1978*a*). In effect, the measure amounted to a large cut in state property taxes: ahead of its passing, the proposed change was seen as likely to cut California's property tax intake by roughly 60 percent, from about $12 billion to $5 billion (*New York Times*, June 4, 1978, p. 1).

In the area of national politics, 1978 saw electoral and legislative debate—carried out through Congressional hearings and legislative sessions, the media, and the promotion of the bill by Republicans in the campaign for the midterm elections in November 1978—on the Kemp-Roth bill (due to Republicans Congressman Jack Kemp, of New York state, and Senator William Roth, of Delaware). This bill—originally introduced in mid-July 1977—proposed across-the-board reductions, of about 30 percent, in individual and corporate federal income tax rates.[185]

A syndicated article, used as the basis for many U.S. newspaper items during the early weeks of the year, foreshadowed the state-level dimension of the 1978 tax debate. In the January 1978 syndicated article, Friedman himself was quoted as remarking: "There's an uproar across the country. The undercurrent against taxation has been nothing less than astonishing." (*Vineland Times Journal* (New Jersey), January 9, 1978.) One of the versions of the article, in the edition of January 11, 1978, in Wisconsin's *Eau Claire Leader-Telegram*, was titled "State Tax Revolt"—and so used the "tax revolt" formulation that would come to encapsulate the debate. This term also appeared in various reports around the country on California's approaching Proposition 13 referendum, such as "National Tax Revolt Is in the Making" (*Sunday Plain Dealer* (Cleveland, Ohio), June 4, 1978) and "Tax Revolt Comes to a Vote" (*St. Petersburg Times* (Florida), June 4, 1978). Friedman, too, used the term in his talk in Scotland in April 1978, after the Proposition 13 vote had already been scheduled: "The public at large is restive, a

[185] On the date of the bill's introduction, see Kiefler (1979, p. 13).

tax revolt is brewing everywhere."[186]

In the "Yes" campaign for California's Proposition 13 campaign, the major public face on the side of its advocacy was Howard Jarvis. Jarvis was president of an apartment owners/landlords association (*Wisconsin State Journal*, June 4, 1978, p. 1), and he had, with Paul Gann, advanced the constitutional amendment and obtained the requisite amount of voter signatures for it to be put to a state-wide vote. On the national stage, however, it was Friedman who was the most eminent figure on the side of the tax revolt at the time of the vote on Proposition 13. For example, a news service report in late May. stated that "economist Milton S. [sic] Friedman" was the "most prominent" supporter of Proposition 13 (*Florida Today* (Brevard County), May 29, 1978, p. 12A).[187] Likewise, an Associated Press report on the tax-revolt campaign described Friedman as "[o]ne of the movement's most eminent ideologists" (*St. PetersburgTimes* (Florida), June 4, 1978, p. 19A), and the *New York Times*' report of the same vintage (June 4, 1978, p. 55) stated: "The movement has its high priest, Milton Friedman, the Nobel Prize-winning economist." About a week later, in lamenting the passage of Proposition 13, John Kenneth Galbraith was quoted regarding Friedman's role in the case for a "Yes" vote: "He's been the guru." (*The York Dispatch* (Pennsylvania), June 12, 1978.)

Friedman had been involved in a number of activities over the first half of 1978 associating himself with the tax-revolt movement. When Proposition 13 was confirmed as going ahead in a state-wide vote, Friedman produced a *Newsweek* column (April 10, 1978) in which he indicated his support for its passage in April 1978 and noted his own status as a founding member of the National Tax Limitation Committee (one—but probably not the single most prominent—groups formed to push for tax reduction).[188] He made a return to the greater Chicago area to be the showcase speaker at the committee's first national conference on May 21 in Lincolnshire, Illinois (*Register-Republic* (Rockford, Illinois), May 22, 1978).[189] And although Friedman was mainly away from California during the Proposition 13 campaign, he gave numerous media interviews arguing for a "Yes" vote and appeared on radio and television advertisements in the California area, urging passage (*Los Angeles Times*, May 15, 1978; *New York Times*, June 4, 1978, p. 55; *The York Dispatch* (Pennsylvania), June 12, 1978). An article on tax limitation, derived from his

---

[186] Friedman (1978e, p. 13). See also the version of the same remarks in *The Listener* (London), April 27, 1978, p. 528.

[187] In fact, as the *New York Times* (October 15, 1976*b*) noted of Friedman, "he has no middle name."

[188] Another group, the National Taxpayers' Union, was likely more prominent.

[189] As the account in the *New York Times* put it (June 4, 1978, p. 55), Friedman "was the main drawing card at the Chicago [area] meeting."

May 21 speech, was scheduled for summer publication in the Heritage Foundation's *Policy Review* periodical, and once Proposition 13 was passed, Friedman rapidly revised the draft, which promptly appeared in condensed form in the *San Francisco Chronicle* on June 10 and subsequently in other newspapers.[190] Friedman also wrote a separate *Newsweek* column (June 19, 1978) on the passing of Proposition 13.

Friedman's association with the tax-revolt movement was reflected in the issuance, later in 1978, of a new book: The Fisher Institute, a Texas-based small-press publisher of free-market books, collected Friedman's Policy Review article and sundry other items under the title *Tax Limitation, Inflation and the Role of Government*.[191] A quickie paperback book on the tax revolt by Engelmayer and Wagman (1978) also included Friedman's name on its cover as a selling point.[192]

Yet Friedman's image as the leader of the tax revolt proved highly ephemeral: it had dissipated by the time these books appeared. Indeed, it was out of date even in mid-July 1978 when a Wa*ll Street Journal* article on Friedman described him in its headline as a "tax revolutionary" (July 17, 1978). In the course of summer 1978, Friedman had in effect been overshadowed by other, more emphatic proponents of tax cuts. The emerging popular/public-policy movement of "supply-side economics," consisting of various figures in journalism, economics, and politics,

---

[190] For the condensed version of the article, see *San Francisco Chronicle*, June 10, 1978, *Lincoln Journal-Star* (Nebraska), June 12, 1978, and *Columbus Dispatch* (Ohio), June 15, 1978. (The last of these items traced the article to Friedman's May 21 speech.) Friedman's *Newsweek* columns were typically finalized a week or more before publication. So his publication in the *San Francisco Chronicle* on June 10, of an item on which he signed off during the June 7–9 period, represented one of the most rapid moves of his writings into print.

[191] This book (Friedman, 1978b) included, alongside Friedman (1978a), his February 1977 "The Future of Capitalism" speech and reprints, with some omissions, of three Institute of Economic Affairs pamphlets published in the United Kingdom in the 1974–1977 period (two of which had actually already seen print in the United States). The Fisher Institute finalized the book in October 1978 (see Friedman, 1978b, p. IV). This slender book may have not really been available for purchase until early 1979: the meager number of reviews of the book received started to appear early in that year (see *Dallas Morning News*, January 26, 1979; *Lake Geneva Regional News* (Wisconsin), February 1, 1979). These early reviews also indicated that there had been both paperback and hardback versions of the book and that it was available primarily through mail order, rather than bookstores. Macroeconomists who cited the book during the first two decades after it appeared included Robert Hetzel (1997, p. 55) and Alan Stockman (1982, p. 18).

[192] This contained a reprint (see pp. 264–269) of Friedman (1978a). The inclusion of this item justified the claim on the book's cover regarding the book's contents: "Including Milton J. [sic] Friedman[,] Nobel Prize winning economist[,] on tax limitation." As its reproduction in this book and its original appearance in *Policy Review* indicated, Friedman (1978a) amounted to a piece of public-policy popular writing, rather than a research contribution. The article did, however, subsequently receive citations in the economic-research literature—an early example being the reference to it in Bennett and DiLenzio (1982, p. 18), who also patterned the title of their article on that of Friedman's. Even before this, the *Journal of Economic Literature* (1979, p. 765) had included Friedman (1978a) when listing recent research on domestic monetary and fiscal matters.

including Congressman Kemp and Friedman's former colleague Arthur Laffer, had become the main group articulating the tax-cut cause. And they did so in a manner that made cuts a more central policy aim than Friedman did, while also making stronger predictions regarding the effects of tax cuts than Friedman himself could support.

The end result was that, even though Friedman remarked publicly in a speech in California as early as March 1976 that there should be a "taxpayers' revolt across the country, seeking a constitutional amendment that would set a limit to the fraction of income that can be taxed away" (*Stanford Daily* (California), March 11, 1976, p. 19), he would end up being remembered as far less central figure in the state and national tax-cutting movement of 1978−1981 than such individuals as Reagan, Jarvis, Kemp, Laffer, and the *Wall Street Journal*'s editor, Robert Bartley. And the tax revolt would be associated with a brand of economics (supply-side economics) separate from his own.

In retrospect, it is evident that the *New York Times*' description, on June 4, 1978, of Friedman as the high priest of the tax-revolt movement marked the peak of his profile in the movement. The path that subsequent developments would follow would be presaged by the appearance, on the same day (June 4, 1978), of an article in the *Atlanta Constitution* that—in making the case for tax cuts—expounded the "Laffer curve" to its readers. The *New York Times* itself, in an anti-tax-cut editorial on June 19, would concern itself with the Laffer curve—and the editorial would label Laffer "the leading academician of the tax-cut movement," while not mentioning Friedman once.[193] And when Walter Heller wrote a *Wall Street Journal* piece (August 7, 1978) criticizing proposals for a large federal tax cut, he directed his fire at the supply-side movement, particularly Kemp and Laffer, and did not refer to Friedman at all.[194]

Diverging from other tax-cut proponents on the analysis of tax cuts, and now rarely present in

[193] At the time, Laffer was a professor at the University of South California, having left the University of Chicago's business school in 1976. Although, by 1978, Laffer had mainly moved to public-policy activity in his non-teaching responsibilities and was not primarily engaged in contributing to the economic-research literature, he did have a book review published in that year's August issue of the *Journal of Political Economy*. See Laffer (1978).

[194] A largely favorable account of supply-side economics (including using that terminology) that appeared in the press at the time was by Canadian economics columnist Peter Brimelow (in *Financial Post* (Toronto), July 29, 1978). Brimelow, who would publish extended interviews with Friedman in later years, did not mention him in this column on the tax-cut debate. Although Brimelow's column was critical of Laffer, it praised Kemp as well as Jude Wanniski, formerly of the *Wall Street Journal*, whose book (Wanniski, 1978) Brimelow labeled a "highly sophisticated discussion." Brimelow also endorsed the position taken by many supply-siders that Robert Mundell's past writings had laid down "the supply-side academic foundations." (A recent example along these lines was Lawrence Kudlow's statement: "Mundell combined with Art Laffer at the University of Chicago to invent the supply-side policy mix." See *Kudlow*, Fox Business Channel, April 5, 2021.)

Washington, D.C., Friedman would fade as a key figure in the tax-revolt movement. His dissent from major claims of the movement was a focus of his *Newsweek* column of August 7, 1978—a column that, as discussed below, supported a large federal income tax cut while, in effect, taking issue with much of the rationale for it offered by Kemp, Roth, and Laffer.

Furthermore, supply-side figures, including Kemp, Laffer, and the *Wall Street Journal* editorial page, would often revel in emphasizing their disagreement with Friedman on a variety of macroeconomic points. Some of these points of disagreement would have very little to do with tax cuts *per se*.[195] With regard to tax cuts, however, Friedman's own writings and statements indicated that there indeed existed a threefold rift between himself and the emerging leaders of the tax revolt: on the appropriateness of directing tax cuts at the property tax, as Proposition 13 had done; on whether a boost to tax revenues should be regarded as a likely effect of income-tax-rate cuts, as major proponents of the Kemp-Roth bill were claiming; and the status of tax limitation *vis a vis* public-spending limitation as the key measure that would improve U.S. aggregate supply.

As will be seen, these disagreements with the main messages of the tax revolt had been put on record by Friedman by early 1978. But he repeated them over the course of the year. His disagreements with tax-revolt leaders were notable, as, unlike Heller, they came from someone whose anti-Keynesian position might be expected to make him treat those of a supply-side persuasion as allies. Over time, Friedman's critical comments regarding the cases being made for tax cuts achieved wide attention—in effect, achieving the pre-digital-era equivalent of going "viral."

Property taxation and the mix of taxes

During the Proposition 13 campaign, Friedman was cited, including by Jarvis, as having predicted that the measure's tax cut would promote not only the construction industry, but also total employment and economic activity in the state (*Ithaca Journal* (New York), June 1, 1978; *Wisconsin State Journal* (Madison), June 4, 1978, p. 1). The attribution to Friedman was accurate enough. Indeed, as far back as 1972, he had called for a tax cut in California and indicated that such a move would boost the jurisdiction's level of employment (*Pacific Business*, September/October 1972, p. 8). It was, however, not the case that Friedman was an enthusiast

[195] Major examples of such disagreements—in monetary policy and international economics—are discussed in other chapters, rather than in the discussion that follows.

for the specific concern of Proposition 13: cutting property taxes. As Friedman put it in the leadup to the vote, "it's not what I'd most prefer to see" (*New York Times*, June 4, 1978, p. 55).

Notwithstanding his support of Proposition 13, Friedman doubted that the initiative shifted the structure of taxes in a desirable direction. "There's a sense in which all taxes are antagonistic to free enterprise—and yet we need taxes," he had remarked in February before the ballot was scheduled.[196] And in balancing these considerations, Friedman did not think property taxes should be high on the list of taxes to cut, and he accordingly wrote in April that among the "many defects" of Proposition 13 was the feature that it sought to reduce "only the property tax, which is by no means the worst tax." (*Newsweek*, April 10, 1978.)

Indeed, on multiple occasions in the years up to 1978, and again in the months after the passing of Proposition 13 in June that year, Friedman had suggested that, among taxes, property taxes were among the imposts that had the least distortionary effect on the allocation of resources. "[T]he property tax… is by no means the worst tax," he wrote in his post-vote *Policy Review* piece.[197] In his taped commentary series eighteen months earlier, Friedman had gone so far as to say: "The property tax in the United States is probably the best tax we have on the book[s]." (Instructional Dynamics Economics Cassette Tape 204, December 1976, Part 1.) These statements indicated that he believed that the theoretical virtues of property tax that he had earlier acknowledged largely applied to property taxes in practice.[198]

Friedman therefore had reservations about the form in which Proposition 13's architects, and subsequently California's voters in passing the measure, had expressed their resistance to higher taxes. In considering the recent backlash against taxes, Friedman acknowledged that the property tax had been an important catalyst. But the unpopularity of the property tax, he believed, did not really reflect economic damage due to the tax but, instead, the fact that it was paid in the form of an often-substantial single check to the government (as opposed to taxes paid via withholding at source, via instalments of provisional payments, or through the purchasing of goods at prices inclusive of taxes).[199] Another factor, highlighted in the media at the time (for

---

[196] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 25 of transcript.
[197] Friedman (1978a, p. 7). Also in Friedman (1978b, p. 14).
[198] Speaking at a more abstract level, Friedman had still earlier stated (Instructional Dynamics Economics Cassette Tape 37, early November 1969), "There is no tax that I know of which has less adverse effect on anything than taxes on [the value of] pure land." On that occasion, he cited the characteristic that the tax's imposition would likely leave unaffected the equilibrium quantity of land and would instead be felt only in the sale price and rental value of land.
[199] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 25 of transcript.

example, *Today* (Brevard County, Florida), May 29, 1978, p. 1A, and *St. Petersburg Times* (Florida), June 4, 1978, p. 18A), was that the pace of increase in many Californian homeowners' tax liabilities had stepped up sharply in the period up to 1977, as rising house prices had led to very sharp consecutive-year hikes in property tax assessments.

Henry George's argument, in his book *Progress and Poverty* (1879), in favor of property tax had left a strong impression on Friedman.[200] "In my opinion, and this may come as a shock to some of you, the least bad tax is [on] the unimproved value of land, the Henry George argument of many, many years ago," Friedman told an audience in early 1978. Furthermore, Friedman suggested that he might prefer the George scheme even to the flat-income-tax scheme he had proposed in *Capitalism and Freedom*.[201]

Friedman's endorsement of the property tax did indeed have shock value—to judge by the extent to which he was subsequently quoted on the subject. In particular, a set of Friedman comments that appeared in a syndicated newspaper article in late 1978 (see *The Times Recorder* (Zanesville, Ohio), October 5, 1978) included the remark: "In my opinion, the least bad tax is the property tax on the unimproved value of land—the Henry George argument of many, many years ago.

As already indicated, that endorsement became an example of a quotation that went "viral" even before the age of the worldwide web. The sentence would be quoted far and wide, including in the United Kingdom's *Journal of the Royal Society of Arts* in January 1984 and in Gregory Mankiw's *Principles of Microeconomics* textbook (2004, p. 168). Friedman reaffirmed his enthusiasm for the principle of land tax in later years—observing, for example, in April 1981: "I am in favor of a greater use of property tax, land value taxation."[202]

---

[200] Friedman mentioned George's argument in the aforementioned commentary in Instructional Dynamics Economics Cassette Tape 37 (early November 1969).
[201] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 25 of transcript. However, in comments appearing later in 1978, discussed further shortly, Friedman indicated that "my ideal system… would contain an income tax" alongside the property tax (*The Times Recorder* (Zanesville, Ohio), October 5, 1978). He referred in 1981 to "eliminating many kinds of taxes and giving an important role to [taxing] site value." (In Friedman, Porter, Gruen, and Stammer, 1981, p. 33.)
[202] In Friedman, Porter, Gruen, and Stammer (1981, p. 33). In the same discussion, however, Friedman mentioned (pp. 33, 39) practical problems that would be associated with the implementation of property tax and warned against "carrying site value taxation to its full conceivable possible extent" (p. 33). Likewise, in New Zealand some days after these remarks, Friedman (1981b, p. 16) observed, somewhat tentatively: "One can make an argument for… a tax on the site value of land." A quarter-century later, shortly before his death, Friedman named the property tax as a type of tax that found favor with him (*San Jose Mercury* (California), November 5, 2006).

The national tax revolt

The fact that the California debate had been focused on property taxes bolstered the criticism that the tax revolt was being generated by parochial (and well-to-do) interests rather than by popular feeling. However, there was macroeconomic substance behind the reaction against taxes in the United States during the late 1970s—a fact evident when considering the behavior of the federal tax burden during the decade. The average marginal tax rate in the United States, whether measured as the overall rate or the federal individual income tax rate, had declined in 1971 by about 1 percentage point (Barro and Redlick, 2009, Table 1, p. 48). Subsequently, however, as Barro and Redlick (2009, p. 10) recorded: "A period of rising federal income-tax rates prevailed from 1971 to 1978, with the [overall average marginal rate] increasing from 22.7 percent to 28.4 percent."

By the time the rate was reaching this level, there was evidence of an emerging change in attitude toward tax reduction in national political discourse. As the Friedmans would recall in an account written in the mid-1980s, once Proposition 13 succeeded in getting the "taxpayer revolt… thrust into national prominence," the associated change in the political climate started "making it politically profitable to try to reduce taxes."[203]

This development at the national level could, in turn, be seen as in part being the cumulative effect of more gradual changes in public opinion that had taken place in the course of the decade. In early 1971, Friedman had wondered why tax cuts were not more politically popular in the United States.[204] Over the 1970s, however, as the decided increase in federal tax rates took place, he detected a change. He highlighted what he saw as an early sign in this direction: the 1972 electoral defeat of Illinois' Republican governor Richard Ogilvie, who had increased state income taxes. Ogilvie's fate, Friedman believed, would discourage President Nixon from proposing tax increases (*Evening Times* (Trenton, New Jersey), November 28, 1972). Although, in a further development in state politics, 1973's California Proposition 1—jointly constraining taxes and public spending—had been defeated, Friedman in early 1975 ventured the judgment

---

[203] Friedman and Friedman (1985, p. 44).

[204] In Instructional Dynamics Economics Cassette Tape 66 (January 27, 1971), he observed: "Why is it… that cutting taxes is not a politically attractive proposition…? … [Y]ou would think offhand that the most attractive thing a politician could do would be to promise to cut taxes." In Instructional Dynamics Economics Cassette Tape 67 (February 10, 1971), Friedman added that "it's a mystery to me why you have citizens of Chicago anxious to have the federal government impose a dollar of taxes on them so that they can get back 90 cents [worth of government spending]—and yet that's the way they behave."

that policymakers were underestimating the reaction that middle-income taxpayers would give to the increase in the tax burden they had incurred due to the increased size of the public sector (Instructional Dynamics Economic Cassette Tape 163, February 1975, Part 1). And, after the passing of Proposition 13, he suggested that "the political market may have changed" in favor of lower taxes and smaller government budgets (*Newsweek*, June 19, 1978).

The focus of the national tax revolt would be successive versions of the Kemp-Roth tax bill—a version of which would, as noted, ultimately become law as the Reagan tax cut of 1981. Although he supported both the Kemp-Roth bill in 1977–1978 and its later legislated version, Friedman would quickly dispute the economic rationale for the bill and so would create the second of the major rifts between himself and supply-siders.

He and the supply-siders would, nevertheless, have common ground during these years in being critical of the Carter Administration's position on taxes.

The Carter administration and the federal tax system, 1977–1978

With regard to the federal tax system, there had been some promising signs, from Friedman's perspective, in Jimmy Carter's public statements. Carter's reference during the 1976 primary campaigns to U.S. tax arrangements as "a disgrace to the human race" (*San Antonio Light* (Texas), April 28, 1976) closely matched Friedman's own observation in the same period that the American tax apparatus was "an ungodly mess" (*People Weekly*, April 5, 1976). Carter's statement would be favorably quoted by the Friedmans even in the mid-1980s, well after he had left office.[205]

Furthermore, Friedman had long focused on the removal of a myriad of tax deductions as a key part of a program of desirable tax reform, and he had reemphasized this in a *Newsweek* piece (May 12, 1976). Likewise, Jimmy Carter's criticism of tax deductions via his imagery of a "three-martini lunch," had, the *Detroit Free Press* later editorialized (August 14, 1978), "succeeded in dramatizing the need for reform, simplification and equalization" of the tax system. In this vein, Carter's then-adviser Lawrence Klein had remarked during the 1976 campaign: "We're looking for a total overhaul of the system, eliminating many present loopholes, injustices, shelters, and deductions." (*The Sunday Sun* (Baltimore), July 25, 1976, p.

---

[205] See Friedman and Friedman (1985, p. 65). (That discussion cited *New York Times*, June 11, 1976, another place in which the Carter quotation appeared.)

K7.) A few weeks into his time in office, on February 10, 1977, Carter remarked: "The next move will be comprehensive income tax reform. This will be headed by the Secretary of the Treasury, Mike Blumenthal. And before the end of this year, we will be ready to recommend to the Congress a comprehensive, overall tax reform proposal."[206]

No such major streamlining of the tax code materialized in Carter's tenure, and the Friedmans would later contrast another, earlier occasion when Carter promised "comprehensive tax reform" with his actual record as president.[207] To Friedman, this outcome was politically inevitable. As he saw it, the *quid pro quo* of removing deductions should be across-the-board cuts in tax rates. And he did not see the two sides of politics agreeing to do this—largely because each feared that the other side would renege by later reintroducing either higher rates or a system of widespread deductions. Consequently, around the time when a *People Weekly* interview with Friedman characterized him as wanting to reform taxes, Friedman made his own pessimism about the matter clearer via a *Newsweek* column titled "Tax Reform: An Impossible Dream" (April 12, 1976). In a speech delivered in February 1978, Friedman reiterated his view that major tax reform was not currently a realistic goal.[208]

Carter did sign into law a bill titled the Revenue Act of 1978 that ostensibly was the culmination of his administration's 1977−1978 reform efforts.[209] But Carter himself had great misgivings in signing the bill, in part because of his awareness that had did not actually meaningfully remove tax loopholes.[210] Consistent with Friedman's analysis, and in contrast to the political climate that would be associated with Reagan's ascendancy, an obstacle to reform was that the Carter Administration was not, in the end, very interested in lowering marginal tax rates—and so had little to offer in exchange for securing the removal of loopholes. The new law did, however, reduce the capital gains tax. Friedman had cited the prevailing capital-gains-tax rate as one of the least controversial cases of a high rate lowering both tax revenue and the taxed activity (*Newsweek*, August 7, 1978). In contrast, the capital-gains-tax cut's inclusion gave President Carter's misgivings when he signed the bill into law (see Eizenstat, 2018, pp. 316–318).

---

[206] See Carter (1977a).
[207] Friedman and Friedman (1985, p. 65) observed that Carter "pledged 'comprehensive tax reform'—a pledge… that he was unable to redeem."
[208] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978.
[209] See Romer and Romer (2009, pp. 64−65).
[210] Carter's reservations, however, also involved fear that the tax cut would exacerbate inflation. Although Eizenstat (2018, p. 318) describes such fears as "prescient," they also exemplified the thought patterns of the administration, noted in Section I above, that focused on fiscal policy rather than monetary policy as the main policy measure capable of influencing aggregate demand.

Correspondingly, the administration had little interest in cutting other tax rates associated with investment income. This was an attitude that would prove politically costly. A selling point made regarding the Kemp-Roth bill was that it would lower the top income tax rate from 70 to 50 percent (see, for example, *National Post* (Toronto), July 29, 1978). Friedman himself stated with regard to federal income tax that "the maximum rate is 70 percent" (*Newsweek*, April 12, 1976).[211] Similarly, the tax cut enacted in the first Reagan term, and modeled after Kemp-Roth, was often said to have lowered the top marginal rate on income from 70 to 50 percent. These statements were true, but only because the tax rate on *dividend and interest income* was 70 percent. The top marginal rate on *labor income* had actually been lowered to 50 percent by law in 1969.[212] The proposed Kemp-Roth tax bill and the actual 1981 Reagan tax cut therefore did not move the top rate on labor income any lower than the rate already in force since the early 1970s.[213] But although, early in the life of the Carter Administration, Secretary Blumenthal had publicly criticized the 70 percent top marginal rate on investment income and stated that the administration might recommend bringing the rate down to 50 percent, it did not proceed to do so, and so it left office with the top marginal rate on investment income still at 70 percent.[214] By allowing the two top income tax rates (on labor income and investment income, respectively) to be so different, the administration underestimated the political damage associated with a headline top income tax rate of 70 percent and the political capital this gave its critics who could, as already indicated, make the technically-true claim that the Kemp-Roth bill proposed to lower the top marginal tax rate on income from 70 percent to 50 percent.

The administration also underestimated the extent to which opinion had turned against tax systems so graduated that they included a 70 percent rate on any class of income. Indeed,

---

[211] Friedman also gave 70 percent at the top income tax rate in Friedman (1977i, p. 50) (see also Friedman 1978b, p. 75; 1991a, p. 155), in *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978 (p. 14 of transcript), and in the condensed version of this lecture that appeared exactly a year later in *San Francisco Chronicle*, February 6, 1979. However, in debating Friedman on television in 1980, Peter Jay referred (*Free To Choose* (U.S. television version), PBS, Episode 5, "Created Equal," February 15, p. 12 of transcript) to the U.S. federal tax system's "maximum personal rate [of] fifty percent"—here referring to the top marginal rate on labor income.

[212] Barro and Redlick (2009, p. 11) give the lower maximum earned-income marginal rate as 60 percent, introduced in 1971. However, the 60 percent rate prevailed only briefly. The end of the year saw the maximum rate actually brought down to 50 percent, completing a reduction (from 70 percent) brought into law in 1969 (see *Federal Reserve Bulletin*, June 1973, p. 401, and Surrey, 1973, p. 280).

[213] As Brooks and Eckstein (1978, p. 51) observed: "Kemp-Roth would cut the top rate from 70 to 50 percent, though it would not cut the top rate on 'earned' income at all." This fact was obscured in much other contemporaneous discussion.

[214] Blumenthal had stated: "When the marginal tax rate gets up to 70 percent, people say, 'What's the point?'" He added that efforts to avoid the 70 percent rate involved decisions to deploy savings "in strange ways… that are not socially useful." (*Washington Star* (Washington, D.C.), June 19, 1977, p. A1.)

Blumenthal actually stated that an aim was to make the tax system "somewhat more progressive" (*Kansas City Times* (Missouri), January 12, 1978). In contrast, Friedman's judgment that the tax system was already too graduated (*Newsweek*, December 19, 1977) proved to be a sounder assessment of the direction of economic and political thinking in the country.

More generally, the administration did not really reduce taxes, despite passing a tax-cut bill. Before Carter took office, Friedman had warned that, as the federal income tax scales were not indexed, a major cut in recorded tax rates would likely not forestall an increase in the rates taxpayers faced (*Newsweek*, January 17, 1977). Upon seeing Carter's income tax proposals, Friedman's verdict was that they, indeed, did not fully offset bracket creep and the administration's other tax increases: "the bottom line is that *President Carter and the Congressional leadership are proposing to raise, not lower, the total tax burden on the American people*."[215] The factors he cited in this late-1977 column were, in the event, magnified by the take-off in U.S. inflation during 1978 and by the fact that the tax-cut bill was not finalized until late in the year. Consequently, Blumenthal's stated intention of "permanent, across-the-board tax cuts" (*Kansas City Times* (Missouri), January 12, 1978) was, in effect, not met, and the administration found itself perceived as in the anti-tax-cut corner of the debate.

Federal tax rates and revenue: the debate over the economics of Kemp-Roth

It was in this atmosphere that the Congressional leadership of the Republican party had endorsed the Kemp-Roth bill and its proposal to cut federal income taxes by approximately 30 percent (*Manchester Union Leader* (New Hampshire), October 6, 1977). The Republicans were in the minority in both houses of Congress, and the bill, as yet, lacked much bipartisan support. It therefore had no chance of reaching President Carter for his signature (or veto) during the 1977−1978 Congress. But it featured heavily in the 1978 Congressional election campaign.

In critiquing the Kemp-Roth proposal during this campaign, newspaper columnist Tom Wicker noted that its advocates were appealing to the "Laffer curve," and, in particular, the notion that a large cut in tax rates might generate *higher* federal tax revenues (*Detroit Free Press*, August 24, 1978).[216] The Laffer curve—a concept that Arthur Laffer had reportedly first advanced during a dinner conversation in July 1974 (see, for example, *The Plain Dealer* (Cleveland, Ohio), July 17,

---

[215] *Newsweek*, December 19, 1977. Emphasis in original.
[216] Another newspaper columnist in this period who criticized the Republicans for embracing the Laffer-curve idea was Richard L. Strout (*Detroit Free Press*, July 20, 1978).

1978; Blinder, 1981b, p. 83)—figured heavily in arguments regarding the case for a large tax cut that took place in the *Wall Street Journal*'s editorial pages in the second half of the 1970s (see Laffer and Seymour, 1979).

Friedman was largely absent from the *Wall Street Journal* exchanges on tax during this period, even as his old sparring partner Walter Heller was deeply involved in it. By the later months of 1978, however, the Laffer curve had become sufficiently pervasive in U.S. public debate that policy-oriented academic economists felt obliged to refer to it: for example, three 1960s-vintage members of the Council of Economic Advisers—Heller, Gardner Ackley, and Otto Eckstein—all discussed the Laffer curve explicitly in submissions to an August 1978 Congressional inquiry on the Kemp-Roth bill, while even Robert Lucas, at an October 1978 conference on rational expectations and economic policy, referred to "Arthur Laffer's influential 'Laffer curve.'"[217] Friedman himself gave Laffer his due when, in April 1981, he mentioned "the famous Laffer curve."[218]

The Laffer-curve idea not only galvanized supply-side supporters of a tax cut. It also provoked, over time, a strong negative reaction in public commentary—to such a degree that by the late 1980s, endorsement of the notion that tax cuts generated higher revenues had become something perceived as undermining the credibility of those making the case for tax cuts, including the Reagan tax cut (see, for example, M.K. Evans, 1983, p. 108). In this vein, Lawrence Lindsey (1985, p. 25) referred to "the derision with which the Laffer curve has been treated in much of the profession." Indeed, the account of 1980s economic policy by Reagan's former adviser Martin Anderson (1988, pp. 151−157) contained an extended discussion making the case that neither officials in the 1980 Republican presidential campaign nor the Reagan administration itself endorsed the notion that a broad-based income tax cut would raise the federal government's tax revenue, on net.

Ironically, however, in the pre-Reagan years the notion that broad-based tax cuts might give rise to an increase in tax revenues had picked up support from a wide variety of commentators—not only various supply-side figures, but also old-style Keynesians, and, with qualifications, from Milton Friedman.

[217] See Committee on the Budget, U.S. House of Representatives, and Committee on the Budget, U.S. Senate (1978, pp. 3−13, 49−50, 104−110) and Lucas (1980, p. 204).
[218] In Friedman, Porter, Gruen, and Stammer (1981, p. 39).

The Laffer-curve idea before 1977–1978

At the level of principle—as distinct from its relevance for the analysis of actual or proposed major tax cuts—the Laffer curve had a long history in economic thinking. Indeed, Robert Hall (1999, p. 48) took exception to the "Laffer curve" label—his grounds being that "Arthur Laffer was hardly the first to recognize that the elasticity of revenue with respect to taxes depends on the elasticity of income with respect to taxes."[219] Likewise, Blinder (1981b, p. 81) suggested that "the analytical foundations of the Laffer curve were in fact established centuries ago." In documenting this statement, Blinder (1981b, p. 83) pointed to statements made in 1774 and 1844, the latter being by Edmund Burke.[220] Adam Smith's *Wealth of Nations* would also be quoted as articulating the Laffer-curve idea.[221]

In the twentieth century, the proposition that tax cuts increase revenue was central to Sir Josiah Stamp's 1922 book *Wealth and Taxable Capacity*, which included (p. 117) a specific argument that a cut in marginal tax rates would so boost private sector incentives and economic activity that it would raise overall tax revenue. Nor was the Laffer-curve notion something that figured in U.S. debates on tax policy starting only in the 1960s or 1970s. For example, the supply-siders of the 1970s emphasized the prominence that Laffer-curve ideas had acquired in public discussions of U.S. tax policy five decades earlier, during the 1920s.[222] The argument had also appeared in debates during the 1950s, with Herbert Stein observing (*Financial Times* (London),

---

[219] Different views have been expressed regarding how obvious the point is: Blinder stated that the arguments for the Laffer curve "require no economic analysis at all" (1981b, p. 81). (It would be more accurate to say that the foundations require only standard assumptions that economists make. The endpoints of the curve—in which zero tax rates generate zero tax revenue and 100 percent tax rates wholly remove incentives to engage in market activity and so, likewise, generate zero tax revenue—indeed require very little economic analysis. But the derivation of a smooth curve between the two points requires economic assumptions.) Lucas (1980, p. 204) took the position that the Laffer curve, as Laffer had articulated it, did involve a rudimentary amount of economic theory.

[220] See also Canto, Joines, and Webb (1981, pp. 77–79) and Laffer and Seymour (1979, p. 5).

[221] Specifically, Canto, Joines, and Webb (1981, p. 77), Lawrence Lindsey (1985, p. 21), and van Ravenstein and Vojbrief (1988, p. 205) quoted Adam Smith (1776, Book V, Chapter 11, p. 414). Smith had suggested that both greater evasion and reduced consumption might mean that high excise tax rates generated less revenue than moderate tax rates. (Like numerous discussions of the revenue/rate matter prior to the twentieth century, Smith was focused on taxes on purchases of specific goods rather than income taxes.) Smith's emphasis on changes in the degree of evasion—as a channel through which revenues were related to the tax rate—anticipated a major theme in Friedman's discussion of the issue.

[222] The supply-side activist and journalist Jude Wanniski had pointed (as would Goolsbee, 1999, p. 1) to Andrew Mellon's 1920s writings for their advocacy of the position that a tax-rate cut would raise revenue (see Committee on the Budget, U.S. House of Representatives, and Committee on the Budget, U.S. Senate, 1978, pp. 4–5), while Jack Kemp (1979, p. 59) would quote President Coolidge endorsing the notion that lower tax rates generate higher revenues.

February 1, 1954) that “many Congressmen operate on the convenient theory that reductions in tax rate increase the revenues.”

For the period beyond the 1950s, however, the controversy would be elevated as the debate on the likely reaction of tax revenues could be raised by a tax cut became a more central aspect of the discussion of major tax cuts. Eventually, both prominent Keynesians and some in the supply-side camp on the issue would both deny having endorsed the empirical validity of the notion that broad-based tax cuts generated higher revenue. In fact, such endorsements had appeared prominently on both sides in 1977−1978—particularly in the context of drawing lessons from the experience of the Kennedy-Johnson tax cut.

Keynesians and the rates/revenue link

On the Keynesian side, Walter Heller would provide fuel for the advocates of the Kemp-Roth tax cut in the course of testifying in early 1977 in favor of the Carter tax-rebate proposal.[223] When Heller was asked about the effects of the 1964 tax cut on federal receipts, he testified: “Did it pay for itself in increased revenues? I think the evidence is very strong that it did.”[224]

Heller’s answer was seized upon by supply-siders and much quoted by them.[225] Heller himself would repudiate his statement, and in the early 1980s he would claim that it had been an “exuberant” off-the-cuff remark (Heller, 1981, p. 17). In fact, however, the remark was not an isolated one: Heller had actually made the same claim on multiple occasions prior to 1977. Indeed, he had in the past included higher revenues as both an *ex ante* rationale for, and the actual effect of, the Kennedy-Johnson tax cut. For example, in a 1965 interview with the London *Sunday Times*, Heller had stated that “by boosting national output and income, the tax cut would generate larger local, state and federal revenues in the long run.”[226]

---

[223] This was the proposal discussed in the previous chapter.
[224] From Heller’s February 7, 1977, testimony, in Joint Economic Committee (1977, p. 161). This was an answer to a question by Senator Javits—not, as Heller (1981, p. 17) misremembered it, an “answer to a leading question by the late Senator Hubert Humphrey.”
[225] See, for example, Paul Craig Roberts (1984a, p. 80; 1984b, p. 86). Although he was one of the supply-siders who played up Heller’s statement, and the one who highlighted it in the *Wall Street Journal* (August 1, 1978), Paul Craig Roberts would later (in *Wall Street Journal*, December 18, 1985) criticize the *Journal*’s editorial writers for damaging the public perception of supply-side economics by associating it closely with the Laffer curve.
[226] *Sunday Times* (London), June 20, 1965. Likewise, Heller (1966, p. 113) had stated: “The upsurge of tax revenues flowing from economic expansion would finance higher levels of local, state, and federal spending than we would have had without the tax cut’s stimulus.” In addition, Congdon (1988, p. 41) noted that the list of benefits of the tax cut that Heller provided in January 1963 included higher revenues.

President Kennedy himself had invoked this argument; in a speech of December 14, 1962, in New York City, widely cited by supply-siders in later years, Kennedy had stated, "an economy hampered by restrictive tax rates will never produce enough revenue to balance our budget... In short, it is a paradoxical truth that tax rates are too high today and tax revenues are too low—and the soundest way to raise the revenues in the long run is to cut the rates now."[227] Likewise, in his contribution the following month to the 1963 *Economic Report of the President*, Kennedy wrote: "Let me make clear… reducing taxes is the best way open to us increase revenues."[228]

And, after the 1964 tax cut was implemented, it became a standard part of Keynesian accounts that one result had been higher overall federal revenue and that future tax cuts might produce the same result.[229] During the 1970s, Heller was not the only leading Keynesian who gave credence to the view that a tax cut was likely to pay for itself. While serving in his position as a Carter adviser, Lawrence Klein had stated (*The Sunday Sun* (Baltimore), July 25, 1976, p. K7): "We could have lower tax rates, actually, but no overall loss of revenue to the government, because, hopefully, the expanding economy under Carter will generate more tax dollars."[230] And in April 1975—ironically, in a conference that Arthur Laffer was co-organized—James Tobin had stated: "If the fiscal stimulus is allowed to have the effect of increasing output and increasing incomes, etc., recovery itself will generate saving and additional taxes to offset and finance that fiscal stimulus."[231]

Where Keynesians like Heller, Klein, and Tobin did differ with the supply-siders was how the tax cut would generate extra revenue. The supply-siders emphasized the reaction of labor and other inputs to lower tax rates and viewed the response of revenues as reflecting an upsurge in both actual and potential output. It is true that the effect of potential output of tax cuts was by no means wholly absent from the case that the Kennedy Administration had made for tax cuts. Kennedy had himself referred in the 1963 *Economic Report of the President* to the

---

[227] *Commercial and Financial Chronicle* (New York), December 20, 1962, p. 2553 (see also Kennedy, 1962). This Kennedy statement would be quoted, sometimes with minor misquotations, in many subsequent discussions of supply-side economics and its alleged connection to Kennedy's economic views. See, for example, *New York Times*, September 18, 1984, *USA Today*, April 24, 2003, Laffer, Moore, and Tanous (2008, p. 56), and Kudlow and Domitrovic (2016, p. 110).
[228] In Council of Economic Advisers (1963, p. IX). This, too, was a Kennedy quotation later used to justify the Kemp-Roth tax cut. See, for example, *The Union Leader* (Manchester, New Hampshire), October 31, 1980.
[229] For example, *Life* magazine editorialized (June 4, 1965) that the 1964 tax cut "helped stimulate so much new productive activity that federal revenues are already higher at the new rates than they were at the old."
[230] Gordon (1978, p. 487) utilized a similar argument, contending that the slack in the U.S. economy in 1976 made candidate Carter's promise to cut taxes, raise government spending, and balance the budget internally consistent.
[231] In Birnbaum and Laffer (1976, p. 50).

"unrealistically heavy burden of taxation," for example.[232] And his Secretary of the Treasury, Douglas Dillon, testified in February 1963: "With lower marginal rates there is, quite naturally, a greater stimulation to effort…There is certainly a great deal more stimulus to put in extra effort if you can retain 35 cents out of every dollar of extra funds than if you only retain 25 cents. That is the reason for lower marginal rates. I think that is a very simple thing to understand."[233]

Nevertheless, the supply channel was not given the most important weight as the means through which the main Kennedy-Johnson economists and other Keynesians saw the cuts as generating revenues.[234] In their assessment, the economy's supply response was likely to be modest, especially in the short run.[235] The principal basis for expecting higher economic activity and hence higher revenues was the reaction to tax cuts of aggregate demand: the boost to private-sector spending arising from the tax cut, and the associated reduced shortfall of output below potential. It was this line of reasoning that had led Heller to maintain that the manner in which the tax cut raised economic activity (and so tended to lead to some or all of the revenue loss associated with lowering taxes to be recouped) was that it allowed aggregate demand curve to intersect with a higher-output position of an existing aggregate-supply curve. That is, as Heller saw it, the tax cut "drew on 'aggregate supply' capacity that already existed."[236]

---

[232] In Council of Economic Advisers (1963, p. XIII).
[233] From Dillon's testimony of February 6, 1963, in Committee on Ways and Means, U.S. House of Representatives (1963, pp. 593−594). See Romer and Romer 2009 (pp. 38−39) for detailed documentation of the point that the Democratic party administrations of the 1960s cited stimulation of aggregate supply as a major reason for a tax cut. Heller (1982b, p. 76) acknowledged that the argument that aggregate supply would be improved had been an ancillary basis for the 1964 tax cut and confirmed that it had exerted a favorable effect on labor supply.
[234] See also Heller (1981, p. 15; 1982a, p. 287; 1982b, p. 76), and the attributions to Heller in Kemp (1979, p. 60) and Paul Craig Roberts (1984b, p. 85). Even the much-repeated Kennedy statements (regarding boosting longer-run output and revenues via a tax cut) had a considerable demand-side or Keynesian dimension embedded in them. Under the views prevailing at the Council of Economic Advisers in the early 1960s, monetary policy and price adjustment could not be counted on to deliver full employment, even over a long horizon, as long as the full-employment federal budget was in a state of what the CEA regarded as an unduly large surplus. The tax cut was designed to lower this full-employment budget surplus. See Council of Economic Advisers (1963, pp. 69−81) and Kennedy's own remark in the same volume (p. XIV) as well as Kennedy (1962).
[235] For example, in a letter to U.S. legislative-committee chairs dated August 7, 1978, Lawrence Klein referred to referred critically to "Arthur Laffer's claims [and] those who have written along similar lines in the past few weeks." (Committee on the Budget, U.S. House of Representatives, and Committee on the Budget, U.S. Senate, 1978, p. 118.) Later, Klein observed (*Chronicle-Telegram* (Elyria, Ohio), March 29, 1982): "We can find some effects of tax rates on labor supply or on savings, but they are small, slow and sometimes not statistically significant. This is hardly a basis for forming a grandiose scheme of public policy." Likewise, Walter Heller, although granting (in *Wall Street Journal*, July 12, 1978, p. 47 of 1979 reprint) that the 1964 tax cut was "well-designed to boost work incentives," Heller suggested that "these benign effects on the supply side work slowly," and Heller (1981, p. 17; 1982a, p. 287) referred to the "long-delayed supply stimulus" of a reduction in income tax.
[236] *Wall Street Journal*, July 12, 1978 (p. 47 of 1979 reprint).

Heller elevated the degree of disagreement between himself and the supply-siders when, in 1978, he retracted his prior statement (actually, statements) that the 1964 tax cut had paid for itself. His revised view was that that tax cut had generated substantial revenues—but well short of an amount that would have made the cut self-financing (*Wall Street Journal*, August 7, 1978).

Friedman on tax rates and revenues, 1962–1976

Friedman's own position on the 1964 tax cut's economic effects was discussed in Nelson (2020b, Chapter 12). As far as the specific implications of the cut for tax revenues were concerned, Friedman's position implied a mixture of agreement and disagreement with the Keynesian interpretation. Friedman, like Heller, saw much of the year-to-year movement in real national income in the 1960s as reflecting changes in aggregate demand, rather than as being instigated by movements in potential output. A further element of agreement with Keynesians was that he was hesitant to put great emphasis on substantial short-run responses of labor or other input supplies. Certainly, Friedman regarded supply responses, including to price signals, as important at the business-cycle frequency.[237] He nevertheless viewed long-run elasticities of factor supplies as significantly larger than the short-run elasticities.

Friedman, however, parted company drastically with Heller, Tobin, and L.R. Klein in not sharing their confidence that a large tax cut, by itself, could generate an appreciable boost to nominal and real aggregate demand in the short run. He did not regard the 1964 tax cut as establishing that such a boost occurred, as it had been a case of *monetized* fiscal expansion. The economic outcomes that followed the 1964 tax cut therefore failed to establish that an unmonetized tax cut of the same magnitude would have appreciably boosted nominal spending (and thus tax revenues).[238] The upshot was that Friedman would *agree* with Heller's ultimate position that the 1964 tax cut had not generated sufficient tax revenue to justify regarding the cut as self-financing. But he would *depart from* Heller's still-high estimates of the extra aggregate spending (both real and nominal) on goods and services produced by the tax cut.[239] Friedman

[237] See Nelson (2020a, Chapter 7).
[238] Similar assessments of the 1964 tax cut were made by Paul Evans (see Nelson, 2020b, Chapter 12) and Gregory Mankiw (see *Wall Street Journal*, September 29, 1983).
[239] The same was true of the prospective change in aggregate demand that would arise from the Kemp-Roth bill. Heller wrote in 1978 that if enacted, the bill would produce "a tidal wave of increased demand and… roaring inflation." (*Wall Street Journal*, July 12, 1978, reprinted in Laffer and Seymour, 1979, p. 49.) In contrast, of course, Friedman did not see a tax cut or other fiscal policy measures as likely, by themselves, to produce such an outcome.

believed that both Keynesians and supply-siders exaggerated the extent to which a tax cut, by itself, could give rise to higher flows of real spending in the short run.

Furthermore, in instances in which increases in tax revenues *were* associated with tax cuts in practice, much of the revenue increase was properly attributed, in Friedman's view, to the monetary policy response. This was so even if the tax cut operated on real activity through supply responses. Absent monetary accommodation of the tax cut, the supply-side improvement in output associated with a tax cut would tend to shift the split of increases in nominal income—rather than increase nominal income itself. As tax collections tended to be geared heavily toward nominal incomes, an unmonetized tax cut would likely have a limited effect on nominal spending, nominal income, and nominal tax receipts. For this reason, even a supply-side-focused account of the tax cut's effects really required, in Friedman's view, monetary accommodation as part of the mechanism making for higher tax revenues.

Friedman nevertheless did see scenarios in which *a tax reform package that included reductions in income tax rates* could give rise to a prompt increase in federal tax revenues. The mechanism he envisioned for this result to be achieved did not rely on immediate large labor-supply responses to the tax-rate cuts and could occur even if the reform left potential output basically unchanged. The key aspect of the reform was that emphasized above: a tradeoff of lower rates for elimination of most tax deductions. The result, Friedman believed, would be an increase in tax revenue.

Friedman's case for tax-rate cuts that would raise revenue was outlined in *Capitalism and Freedom*.[240] Friedman contended in that discussion that a streamlined income tax system in which there would be flat rate (above a tax-free threshold) of about 24 percent, while tax deductions would be strictly limited to work expenses, would make unprofitable the use of tax shelters—as the maintenance of these shelters involved, in effect, paying a marginal rate of income above the proposed flat marginal rate. More income would come to be classified as taxable income, and overall revenues would go up.

There was a difference in this picture of higher revenues from that underlying the arguments that

---

[240] See Friedman (1962a, pp. 175−176). See also his later expositions of this argument in *Newsweek*, April 22, 1968, and *Playboy* (February 1973, pp. 60, 62; reprinted in Friedman [1975a, pp. 21−23; 1983b, pp. 36−38]). The *Playboy* discussion referred (p. 62; see also Friedman, 1975a, p. 22; 1983b, p. 38) to work being done on the matter at the Brookings Institution (meaning primarily the efforts of Joseph Pechman—who would ultimately become much more associated than Friedman was with proposals to reduce tax rates in exchange for removal of deductions).

would be most associated with the supply-siders. Specifically, Friedman emphasized heavily-reduced tax avoidance—and so more income being *recorded in tax returns* in the category of taxable activity—rather than relying on a *sharp rise in economic activity* as a result of the tax cut. Federal tax revenue, in Friedman's view, would rise in the immediate wake of the reform. even if output and potential output were unchanged in the short run. As it happened, Friedman *did* see lower tax rates accompanied by elimination of loopholes, and the more efficient tax system, as boosting potential output—once longer time horizons were considered. But his own rendition of the cuts-raise-revenues argument did not rely on a very large immediate output-supply response (in the form of a shift in the aggregate supply curve).

The proposal, like *Capitalism and Freedom* itself, attracted limited attention at the time, although a *Wall Street Journal* editorial (November 22, 1963) noted that Friedman had found a 23.5 percent flat income tax (accompanied by strict limits on deductions) would generate as much revenue as the existing income tax system and might produce more. Friedman indicated in 1969 that he continued to believe that a 24 or 26 percent flat-rate income tax would generate greater revenues than the existing federal system (Instructional Dynamics Economics Cassette Tape 15, February 1969). Correspondingly, he assessed that a still lower rate would maintain the existing level of tax revenue: over the late 1960s and into the mid-1970s, Friedman assessed this revenue-neutral tax rate to be about 18 percent (*Chicago Tribune*, March 2, 1969) or even 16 percent.[241]

Friedman particularly stressed the reported high marginal rates (especially the 70 percent top rate) as capable of being reduced with little revenue loss: "the high rates raise no revenue," he observed in 1970.[242] "Very few people pay taxes in the higher brackets," he added later, "largely because of the loopholes we've heard so much about."[243]

It was, however, still another reaffirmation of the flat tax proposal, in a *Newsweek* column of April 12, 1976, that attracted somewhat greater attention—and perhaps particularly caught the

---

[241] On the 16 percent number, see *Firing Line*, syndicated, January 8, 1968, p. 21 of transcript, *Playboy* (February 1973, p. 62; reprinted in Friedman, 1975a, p. 23; 1983b, p. 38), and Friedman (1977i, p. 50; reprinted in Friedman, 1978b, p. 75). The last of these items was based on remarks Friedman made in September 1976. (The remarks, although given in London, were made specifically in reference to the U.S. federal tax system.)

[242] Friedman (1970b, p. 438). Similarly, in Instructional Dynamics Economics Cassette Tape 15 (February 1969), he had remarked that "the high rates yield no revenue" and in *Newsweek*, April 22, 1968, he had described the high rates as being "almost pure window dressing." Consistent with these judgments, Splinter (2020, pp. 1006−1007) finds that "in 1962, the top [U.S. federal marginal income tax] rate applied to fewer than 500 tax returns and, despite a top statutory rate of 91 percent, the top 1 percent [of income earners'] average federal income tax rate was only 16 percent."

[243] *Playboy* (February 1973, p. 60). Also in Friedman (1975a, p. 21; 1983b, p. 36).

eye of Ronald Reagan.[244] In this column Friedman noted that, between 1929 and 1972, the number of U.S. taxpayers reporting themselves as earning over a million dollars or more in income had been stagnant—an outcome suggesting widespread understatement of income for tax purposes and heavy recourse to tax loopholes.[245] He proposed that either simply abolishing all marginal income tax rates higher than 25 percent and doing nothing to deductions, or, instead, streamlining available deductions and imposing a flat income tax rate of 16 percent, would generate greater tax revenue. Notably, the published column was interspersed with subheadings "LOWER RATES… HIGHER REVENUE."[246]

Reagan on tax rates and revenues, 1977−1978

Columnist Tom Wicker accurately predicted in 1978 that Ronald Reagan was likely to include a Kemp-Roth-style tax cut in his program, should he run for president again (*Detroit Free Press*, August 24, 1978). Notwithstanding Reagan's support for Kemp-Roth and Jack Kemp's own enthusiasm for Laffer-curve ideas, it has become a matter of controversy whether the economic thinking of the Reagan campaign and administration actually relied on Laffer-curve arguments. Specifically, and as already indicated, Martin Anderson, an adviser to Ronald Reagan both before and during his presidency, would later question whether anyone closely linked to the Reagan economic team ever suggested that a large tax cut like Kemp-Roth would promptly yield higher tax revenues. Indeed, Anderson (1988, p. 151) referred to "the myth that Reagan and his key economic associates believed that large tax cuts would produce more revenue."[247]

In considering this same question, the discussion below will narrow it to Reagan specifically and to the 1977−1978 period. It will be seen that Reagan did himself did invoke the argument that tax-rate cuts would raise revenues—and that he cited Friedman as one inspiration regarding this point.

---

[244] Friedman's *Newsweek* column was highlighted by Allen Wallis in a conference on income distribution held at the Hoover Institution in May 1976: see W.A. Wallis (1977, pp. 145−146). In the subsequent floor discussion James Tobin, like Wallis, seemed to endorse the Friedman position that reduced tax rates would yield more revenue via the reduced recourse to tax loopholes—but indicated he would prefer other tax reforms (see Campbell, 1977, p. 174).
[245] In Instructional Dynamics Economics Cassette Tape 48 (April 15, 1970), Friedman referred to an earlier occasion on which he carried out this exercise. In both cases, the judgment he reached was that reporting millionaires had not shown the scale of increase in number since 1929 that one would expect from the growth in U.S. national income and in the population.
[246] Friedman also referred to this column in Friedman (1977i, p. 50) (see also Friedman, 1978b, p. 75; 1991a, p. 156), in remarks delivered in the summer of 1976, and reaffirmed that his proposed tax "change would yield *more* revenue."
[247] See also Anderson (1988, p. 153).

Anderson conceded that, in an October 8, 1976, newspaper column, Reagan did give weight to the hypothesis that tax cuts might generate higher tax revenues, and he cited the federal tax cuts of the 1920s and 1960s in that connection. Indeed, the column was bullish on this point, and it was titled "Income Tax Cuts Raise Revenues" in one outlet (*San Diego Union* (California), October 8, 1976). But Anderson contended that this Reagan discussion was an isolated instance and one in which Reagan did not definitively claim that the tax cuts in question generated higher revenues. However, contrary to Anderson's contention, the 1976 column was not a single example. For example, in a September 1978 newspaper column, Reagan maintained that the tax cuts of the Harding, Coolidge, and Kennedy (really, Johnson) presidencies had all raised federal tax revenue (*Manchester Union Leader* (New Hampshire), September 5, 1978).

For the purposes of this book, however, the most interesting example of Reagan's deployment of the tax-cuts-generate-revenues argument occurred in a talk on October 18, 1977, that Reagan composed for his regular radio commentary series. In this broadcast, "Taxes," Reagan stated: "Economists like Paul McCracken of the University of Michigan, Milton Friedman [of] University of Chicago, Arthur Laffer of USC, Allan Meltzer of Carnegie Mellon University, and Arthur Burns, Chairman of the FR [i.e., Federal Reserve] Board, have each made it clear that government can increase its tax revenues and create the jobs we need *without* inflation by lowering the tax rates for business and individuals… Twice in this century, in the 1920s and the early Sixties, we cut taxes substantially, and the stimulant to the economy was substantial and immediate."[248]

Thus, not only did Reagan see the case in which tax cuts raise Treasury revenues as empirically relevant, but those with whom he associated the proposition included not only Laffer but also Friedman. Furthermore, Reagan believed that the argument applied to "something like the Kemp-Roth bill" (*Manchester Union Leader*, September 5, 1978).

In 1977 and 1978, however, Friedman would sharply separate himself from those claiming that higher tax revenues would result from the tax cut envisioned in the Kemp-Roth bill.

Disputing revenue claims about Kemp-Roth—Friedman's second break with the supply-siders

[248] In Skinner, A.G. Anderson, and M. Anderson (2001, p. 274). Actually, of course, Friedman had left the University of Chicago by the time of Reagan's broadcast—as would be brought home to Reagan when, as noted above, he subsequently saw the Friedmans in Los Angeles in November 1977.

We have already seen that Friedman did not subscribe to the view that large tax cuts, in isolation, triggered such a vigorous increase in *aggregate demand* as to make the cuts self-financing. Nor, as noted above, was it likely that Friedman viewed potential output as strongly responsive, in the short run, in response to tax cuts, so he parted company with the familiar supply-side rationale for tax cuts. It is nevertheless true, as Reagan suggested, that Friedman did see conditions under which a lowering of tax rates could be expected to generate higher revenue—and he regarded these conditions as achievable in practice. But he did not see the Kemp-Roth proposal as achieving them.

Friedman made this evident in his *Newsweek* column of August 7, 1978, titled "The Kemp-Roth Free Lunch." The column's title virtually duplicated that of Walter Heller's *Wall Street Journal* op-ed, "The Kemp-Roth-Laffer Free Lunch," to which Friedman did not refer but which had appeared in print on July 12, 1978, about two weeks before he wrote his column. Friedman presumably avoided repeating the "Laffer" part of Heller's title both in order to concentrate on the proposed tax cut and because he was disinclined to set off a direct exchange in print with Arthur Laffer. Nevertheless, without invoking Laffer's name, Friedman's column did in effect address the Laffer-curve arguments being made in 1978 for the Kemp-Roth tax cut proposal.

The analysis in the column largely concerned the empirical relevance of the proposition that the Kemp-Roth tax cut would shift the United States to a higher point on the Laffer curve. Friedman had already indicated his judgment on this proposition in November 1977, when he had stated that "I don't go along with Mr. Kemp's reasons" for the Kemp-Roth bill.[249] Now, nine months later, he made the same point in his *Newsweek* column. Kemp and Roth, he observed, had argued "that lower rates will so sharply increase incentives to work, innovate, and invest that national output will rise apace and, as a result, so will the tax base and government revenue." Incentives would be increased, Friedman granted, and there would also be some reduced tax avoidance. But, in claiming that overall tax revenue would increase, Friedman concluded, "their argument falters… [as] the deficit would, at least initially, go up." (*Newsweek*, August 7, 1978.)

His column did not lay out in detail the basis for this judgment. But that basis could be gleaned from previously-expressed Friedman positions: a tax cut like that in Kemp-Roth would not generate a large enough supply response (whether measured by output, potential output, or hours worked) in the short run to pay for itself, nor—as it would still leave many marginal rates well

---

[249] *Milton Friedman Speaks*, Episode 6, "Money and Inflation," taped November 7, 1977, p. 37 of transcript.

above 25 percent—would its dampening effect on the private sector's incentive to exploit tax loopholes be of a size great enough to boost overall tax receipts.

In December 1979, Friedman reaffirmed his *Newsweek* judgment on the Kemp-Roth proposal. He contended that, although there were some types of taxes might "have such great disincentive effect" that a lower rate would lead to increased tax revenue, "I do not believe that is true for the tax system as a whole" (*The Register* (Santa Ana, Orange County, California), December 23, 1979, p. A11).

In addition, Friedman felt that Kemp, Roth, and other supply-siders were, by concentrating on taxes, neglecting the extent to which the size of the public sector, however financed, was a factor holding down the level of potential output.

Taxes and measuring the cost of government: Friedman's third break with the supply-siders

Friedman's focus on government spending, rather than taxes, as the key budgetary total that needed to be restrained moved him away from the center of the tax revolt, while also putting him at further odds with supply-siders. Correspondingly, the supply-siders, due to their concentration on tax reduction, would be more prominently and enduringly identified with the tax revolt than Friedman would be.

"The crucial matter is not the size of the deficit, but the level of government expenditures," Friedman had remarked in 1966 (*Saturday Review*, March 5, 1966, p. 69). This was a point that he upheld over the following four decades, during which he would underline it repeatedly. Developments beyond the 1960s would change the manner in which Friedman expounded the point: as the momentum underlying the tax revolt built up, the variable he contrasted with spending would often be taxes, rather than deficits. In this vein, in early 1975, both in his *Newsweek* column and on television, Friedman laid out a formulation that would become a very familiar maxim on his part: the true tax on the American people was the amount the government spent, not the amount of that spending whose financing was associated with explicit tax revenue. He observed in his column that "the true cost of government is measured by government spending, not by receipts from explicit taxes" (*Newsweek*, January 27, 1975*a*, p. 27), and he reinforced the message in a television interview a few weeks later when he remarked that "the real tax all of us pay is what government spends" (*Wall Street Week*, Maryland Public Television, February 7, 1975, p. 19 of transcript).

The rationale underlying Friedman's stand was that even government spending not financed by taxes represented a diversion of resources from the private sector, and so it (along with regulations) constituted "levies" on the private sector that shifted income from producers of goods and services to non-producers (*Newsweek*, August 19, 1974). One of the ways in which Friedman illustrated this point was by citing the behavior of the private sector's real disposable earnings. Its tepid behavior in the decade through mid-1974 had contrasted with the strength of real income per person.[250]

And, as was discussed at length in Chapter 6, Friedman suggested that the growth of the public sector might ultimately bear adversely on economic growth. Consequently, in the face of growing public spending shares, "my long-run concern is that we're headed toward stagnation, sharply reduced economic growth rates." (*Washington Star-News* (Washington, D.C.), July 15, 1974, p. A9.) In the 1970s, as this situation seemed to be realized, Friedman downplayed the degree to which tax cuts, alongside an unchanged volume of government spending could, by itself, provide much relief to the private sector. Budget deficits were financed either by money creation or government debt issuance, and each of these financing measures amounted to one form or another of a tax on wealth.[251]

Friedman felt so strongly on this issue that he was increasingly pressing this issue in discussions with academics. On one important occasion, this reached a situation of talking at cross-purposes with his interlocutor. Robert Barro was a visiting fellow at the Hoover Institution in the 1977/1978 academic year.[252] Barro would, as discussed in Chapters 6 and 8 above, usually be regarded as on the same page as Friedman on matters of fiscal policy. The Ricardian equivalence argument that he formalized (Barro, 1974) could be regarded as essentially confirming that the size of government spending is the better longer-run measure of the tax burden. Subsequently, and similarly in keeping with Friedman's position, Barro (1978, p. 576) would criticize Buchanan and Wagner's (1977) proposed constitutional amendment limiting the budget deficit as not addressing the pressure of the public sector on resources because it was unlikely to limit government outlays. But another Barro analysis of roughly the same vintage—

[250] Again, see Friedman's column in *Newsweek*, August 19, 1974.
[251] In the 1980s, Friedman would qualify this view somewhat by indicating that he believed that public debt issuance, while comparable with a tax on some dimensions, likely had less adverse effects on resource allocation than did taxes on income (*Wall Street Journal*, December 14, 1988). This complemented other arguments he had made for permitting temporary budget deficits.
[252] See National Bureau of Economic Research (1981, p. 10).

"On the Determination of the Public Debt"—initially attracted Friedman's ire.[253]

Barro recalled: "You know, I have a later paper that came out in '79 about tax smoothing, which was also [like Barro, 1974] in the *Journal of Political Economy*, that modified the Ricardian equivalence to allow for some public finance like optimal tax considerations, [according to which] the timing of taxes did matter, and there was kind of an optimal time pattern. I gave a seminar at Stanford, I think it was in 1978. It was after Milton had left Chicago. And I was giving that paper—which he should have liked. But he thought I was saying something different from what I was saying, and he just completely trashed the paper. He basically wouldn't let me get past page six. Because he kept saying the cost of government is the expenditure and the resources that are used up, not really the taxes *per se*—which is kind of a Ricardian-equivalence argument. My argument [in Barro, 1979] was not really at odds with that position, except that it said that there were tax distortions and that the timing mattered somewhat." (Robert Barro, interview, June 4, 2013.)

The new Barro paper took the path of government spending as given and looked at the appropriate mix of taxes over time. This was a valid exercise, and its findings were actually in keeping with Friedman's longstanding preference for tax-rate schedules that were stable over time. In particular, the analysis was in keeping with arguments regarding the optimal setting of fiscal policy in the presence of the permanent income hypothesis. But, although the paper's analysis was consistent with Friedman's larger vision, the fact that it did not treat government spending as a choice variable provoked a strong reaction from Friedman when Barro presented the paper at the Hoover Institution economics seminar.

Friedman's behavior at the seminar verged on disruptive; he kept stressing his refrain that the overall tax burden could not genuinely be eased unless government spending itself was lowered. Barro did not disagree and tried to point out that his analysis was concerned with the separate issue of achieving the least distorting mix of explicit taxes and other financing tools against the background of a given size of the public sector. "So you can think about an optimal pattern and therefore the optimal way of choosing fiscal deficits. But Milton thought I was saying something different. And he'd obviously not read beyond page seven, so he was determined that I was not

---

[253] The seminar likely took place during the first three months of 1978. The published version of the paper appeared in October 1979 (Barro, 1979), and Barro presented the paper at a Cowles Foundation seminar at Yale University on March 30, 1979 (see *https://cowles.yale.edu/cf-seminars*). Barro, however, already had a manuscript version of the paper in December 1977 (see Barro, 1978, p. 580), and he also circulated a working-paper version in 1978 (see Brennan and Buchanan, 1980, p. 13).

going to get beyond that in the seminar. And he succeeded in that." (Robert Barro, interview, June 4, 2013.) Friedman missed this message—perhaps because he no longer followed his University of Chicago-era practice of studying papers in detail before their presentation—and his behavior at the seminar prevented Barro from getting to the paper's main results in the seminar.[254] "This was very puzzling. I mean, George Stigler happened to be there [at the seminar], and Bob Hall, and it was a very strange situation… But what Bob Hall said to me after that seminar was, 'I've seen seminars that ended up like this and [that was when the paper] didn't go anywhere. 'But,' he said, 'I've never seen it happen before with a good paper'—that's what Hall told me at the time." (Robert Barro, interview, June 4, 2013.)

Friedman's stress on public spending, rather than taxes, as the magnitude that better captured the public sector's absorption of the economy's resources necessarily put him at odds with the tax-limitation movement. But this tension produced less of a conflict in aims in the state-level debates. Existing requirements for approximate balance of U.S. states' budgets, and the absence of money creation as an option available to the state governments, meant that limitations on tax revenues did put an automatic limit on public spending.

In light of the tight link, at the state-government level, between tax limitation and spending link, California's Proposition 13 campaign in 1978 saw both the "No" and "Yes" campaigns taking for granted that state government spending would be restricted by the reduction in tax revenue. On the "No" side, the stand taken was captured in an Associated Press headline, "Officials in California Fear Nightmare If Taxes Slashed" (*Minneapolis Star*, June 1, 1978), and after the result, John Kenneth Galbraith suggested that once California's voters saw the repercussions for public services of Proposition 13, they would blame Milton Friedman and wish he had never moved from Chicago (*The York Dispatch* (Pennsylvania), June 12, 1978). On the "No" side, Friedman characterized claims that school closures or cuts to emergency services would result from passage of Proposition 13 as "scare tactics" (*San Francisco Sunday Examiner and Chronicle*, May 14, 1978). "There isn't a person in California who could say with a straight face that 10 percent [of California's state government spending] couldn't be cut," he remarked a

[254] Barro observed of the 1979 paper: "this was distinguishing taxes by their timing and that the timing matters in the same way for thinking about different types of taxes in the sense of how much deadweight loss there is. So it's a kind of second-order argument." (Robert Barro, interview, June 4, 2013.) As already indicated, by December 1988 Friedman's discussions of taxes and deficits seemed to have incorporated a version of this argument. This could be seen as a generalization, to include the choice between debt and other forms of financing, of Friedman's position that "some taxes do more harm than others… [so] the method by which we collect taxes could be rearranged so as to have a less adverse effect on incentives and production." (In Friedman, 1978a, p. 11. Also reprinted in Friedman, 1978b, p. 18.)

couple of weeks before the vote (*Dallas Morning News*, May 22, 1978). Friedman made a similar remark in the column he wrote in the wake of the referendum result, while expressing satisfaction that the "Yes" vote had withstood a "massive campaign against Proposition 13 by the Establishment… [T]he public refused to be bamboozled this time" (*Newsweek*, June 19, 1978). While rejecting the notion that basic public services were threatened, Friedman did relish the prospect that Proposition 13 would bear down on the size of California's public sector. Before the vote, he had suggested that the measure represented "the best chance we have to control government spending" (*San Francisco Sunday Examiner and Chronicle*, May 14, 1978), and he also noted: "Anything which reduces the amount of money available for government is a good thing."[255] In his *Newsweek* column in April, he approvingly quoted a letter that had appeared in the *San Francisco Chronicle* that had stated that it was not irresponsible to want the state public sector "severely disrupt[ed]," in the sense of creating pressures to reduce its size.[256]

The *San Francisco Chronicle* letter and Friedman's quotation of it were noted in the account of the tax revolt by one of the architects of Proposition 13, Howard Jarvis, in his own account of the tax revolt (see Jarvis and Pack, 1979, p. 124). However, that account took issue with Friedman by criticizing measures oriented directly on restriction of government spending, such as 1973's Proposition 1. Such measures, Jarvis argued, failed to convey benefits to taxpayers as clearly as tax-limitation measures did (see Jarvis and Pack, 1979, pp. 39, 187). Friedman himself acknowledged that one attraction to voters of tax-limitation measures was that they provided more visible gains than spending limitations.

Jarvis would remark with regard to the Proposition 13 campaign: "Having Friedman in our corner was a big plus."[257] Following the passage of Proposition 13, Friedman continued to provide some public support to Jarvis' efforts, including via being one of those appearing in a paid television program, *The Howard Jarvis National Tax Revolt*. This program, broadcast on most of the major NBC-affiliated television stations in the United States on September 26, 1978, resulted from the purchase by Jarvis' faction of the anti-tax movement of airtime in a prime-time slot (*Boston Herald*, September 23, 1978).

Over the same period, however, Friedman was also going his own way. He joined in taking credit for the Proposition 13 victory, but in doing so, Friedman cast the campaign as a follow-up

[257] Jarvis and Pack (1979, p. 107).

to the 1973 and 1976 referendum campaigns for spending-limitation in which he had been involved. The difference between Proposition 13 and the earlier campaigns that he highlighted was the result: previously, he had been "unaccustomed to being on the winning side" (*Los Angeles Times*, July 27, 1978). Both before and after the Proposition 13 vote, Friedman made no bones about the fact that he was more excited about progress in spending-limitation amendments to state constitutions than those aiming to limit taxes. In this vein, in April Friedman affirmed that Proposition 1's joint spending-tax limitation measure in 1973 had been "a far better measure" than Proposition 13 (*Newsweek*, April 10, 1978). In that commentary, at the May 21, 1978 National Tax Limitation conference, and in his June *Newsweek* column of June 19 (written after Proposition 13 had been passed), he highlighted the spending-limitation amendment that had been passed by Tennessee voters on March 7.[258] His summer 1978 *Policy Review* piece "The Limitations of Tax Limitation" made clear, as the title suggested, that he still believed that government-spending limitation, rather than restrictions on tax rates, remained the best approach to follow, including in the area of constitutional amendment.

And on June 18, Friedman gave testimony to a hearing of the Nebraska state legislature in support of a proposed constitutional limitation on spending (*Alliance Times-Herald* (Nebraska), June 19, 1978). He did so by telephone, to a hearing that included not only the committee members but about 400 audience members, many of whom found Friedman's testimony, relayed through a speaker mechanism (*Lincoln Journal* (Nebraska), June 19, 1978, p. 1). In a move that underlined the difference between his own policy preferences and those of Proposition 13's designers, Friedman at the same hearing opposed two other proposed amendments (also being considered at the hearing) that would impose limits on property taxes (*Lincoln Journal* (Nebraska), June 19, 1978, p. 1).

In his testimony, Friedman suggested that limitations should apply at all levels of government (*Omaha World-Herald* (Nebraska), June 19, 1978). Friedman himself was involved in what he hoped would be an imminent next step of change at the national level. *The Economist* of August 12, 1978 reported: "Mr. Milton Friedman, the monetarist who backed Proposition 13, recently announced the appointment of a 'blue-ribbon' panel to draft an amendment to the constitution limiting federal spending and deficits." Specifically, as part of his involvement in the National Tax Limitation Committee, Friedman was a key member of a body that concerned itself with drafting a federal constitutional amendment. There were 28 others in this drafting group,

[258] On Friedman's remarks at the May conference, see *Register-Republic* (Rockford, Illinois), May 22, 1978.

including Paul McCracken. Friedman headed a press conference on the matter, held on July 26, 1978, in Washington, D.C. (*Los Angeles Times*, July 27, 1978).

At the press conference, Friedman declared that "people are simply fed up" at the size of the public sector (*Salt Lake Tribune* (Utah), July 27, 1978). Asked if the amendment would limit the president's and Congress' scope to address national problems, Friedman gave the contrarian response: "I certainly hope so. The purpose of this amendment is precisely to limit the power of government with respect to the percentage of income it can extract." (*Los Angeles Times*, July 27, 1978.) Although, at the press conference, there was a suggestion that the drafting of an amendment might be complete by the end of the year (*Salt Lake Tribune* (Utah), July 27, 1978), in the event the draft amendment was not finalized and announced until 1979.

Even when drafting was incomplete, Friedman was already talking up the amendment on a *Meet the Press* appearance of November 12, 1978: the U.S. government would "have a limited total amount of money… [then] decide how best to spend it."[259] He indicated he had been fortified by the latest development at the state level—the success of a spending-limitation referendum in Michigan at the elections earlier in the month, in contrast to the October 1976 result in the same state.[260] Making the rounds in favor of the national spending limitation amendment once it was drafted, and advocacy of its subsequent incarnations, was something to which Friedman devoted a great deal of his time in 1979 and the first half of the 1980s.

In the meantime, he had not given up on achieving restriction on the size of the public sector through the more mundane route of seeking change by legislative action on the U.S. budget. As Robert Barro's early-1978 seminar experience showed, Friedman was concerned with driving home his point that it was government spending that measured the pressure of the public sector on national resources. Friedman's discussions during 1977 and 1978 of budgetary proposals advanced by President Carter and by members of Congress also reflected this emphasis. "The real tax load which government imposes on the public is the total amount government spends," Friedman remarked in a 1977 interview.[261] The following February, he remarked in Pasadena, in his talk on tax reform. that "the real tax is what government spends, not what it takes in in the form of so-called 'taxes.'"[262] A couple of weeks later, in a speech given to the National

Association of Manufacturers, he reaffirmed: "The true tax that the American people pay is what government spends."[263] Friedman stressed this point yet again at his May 21 talk to the National Tax Limitation Committee and in its published version in *Policy Review*.[264]

Furthermore, it was, he increasingly emphasized during 1978, not until government spending was cut that the genuine tax burden in the United States could be regarded as having been reduced. He was suspicious of proposed tax cuts both because they did not reduce the spending-to-output ratio or even necessarily the share of taxes in output. "Neither the Republicans nor the Democrats at the moment are proposing to reduce taxes," he remarked in February 1978.[265] At the tax-limitation conference three months later, he reminded the audience that both Republicans and Democratic politicians had promoted the historical growth in federal government spending (*Omaha World Herald* (Nebraska), May 22, 1978). And, with regard to what was in prospect, Friedman maintained that, by the criterion he used, neither President Carter nor Congress was really offering a reduction in taxes (*Dallas Morning News*, May 22, 1978). Friedman did not exempt the Kemp-Roth proposal from this criticism. Kemp-Roth, he insisted, was not a genuine tax-cutting bill because it did not entail a cut in government spending.[266]

It was at the time of his late-July launch of his federal spending-limitation project that Friedman addressed the Kemp-Roth bill in his *Newsweek* column. As already indicated, the column in question (August 7, 1978) was critical of the invocation by the bill's sponsors of the Laffer-curve argument—which Friedman did not regard as empirically relevant for the broad-based cut being proposed. But, beyond his doubts about the applicability of a Laffer-curve-based revenue increase to the Kemp-Roth proposal, Friedman was critical of the way in which Kemp and Roth were portraying higher government spending as achievable due to higher revenue. For the legislators to argue that "lower tax rates can make possible higher government spending," Friedman remarked, was to advertise, as a benefit of the bill, something—higher public spending—that should not be encouraged. In the same vein, he came back to his mantra: tax cuts not occurring alongside commensurate reductions in government spending did not really relieve the tax burden. If implemented, he suggested, the Kemp-Roth bill would reduce explicit taxes—

but, absent a cut in federal government spending, the implicit taxes associated with greater deficit spending would go up. A full-fledged tax reduction, Friedman insisted, could be regarded as achieved only when government spending was reduced.

Nevertheless, Friedman came out strongly in favor of the Kemp-Roth proposal. Partly this was because he saw the supply-side stimulus that would arise from the cut as desirable, even though it would take time to emerge. But the primary basis for his support of Kemp-Roth lay elsewhere—the "starve the beast" argument. The tax cut would indeed reduce revenues for the period ahead, he suggested—but this would be a desirable result of the cut. The federal government, unlike its state counterparts, had wide legal and institutional scope to undertake ongoing public borrowing in the face of a revenue shortfall. But Friedman regarded the political environment as creating a practical limit to federal borrowing. Consequently, a lower overall level of federal tax receipts would create pressure to reduce government spending. Hence, for Friedman, an immediate tax cut offered the best chance of a lower path of government spending in future periods.

STARVE THE BEAST

A higher tax intake, Friedman remarked in his summer 1978 *Policy Review* article, "fosters a higher level of government spending. That is why I am in favor of cutting taxes under any circumstances, for whatever excuse, [or] for whatever reason."[267] Likewise, in his August 7 *Newsweek* piece he remarked that, as limits existed on the "tolerable deficit" that U.S. policymakers perceived they could run, "the only effective way to restrain government spending" lay in tax cuts—which, by limiting federal revenue, promoted economies in public expenditure.
This "starve the beast" view of fiscal policy amounted to a positive analysis of the historical source of U.S. government spending. It also had, in Friedman's case, a particular normative dimension, as it served as a basis of some of his prescriptions for limiting public spending.[268]

Several modern-day pieces of writing on the "starve the beast" position have taken the two 1978 statements noted above as the benchmark Friedman references on the matter. For example, Moghaddam (2012, p. 595) and Alexander James (2015, p. 240) cite Friedman's *Policy Review*

---

[267] Friedman (1978a, p. 12), reprinted in Friedman (1978b, p. 19).
[268] As will be seen, John Kenneth Galbraith and Robert Eisner shared Friedman's positive analysis but, as supporters of high levels of public spending, they saw that analysis as a basis for refraining from tax cuts.

article, while Bartlett (2007, pp. 8–9) quotes both that article and the August 7 *Newsweek* column. None of these three retrospectives gives any indication that Friedman voiced the "starve the beast" argument publicly before 1978.[269] Indeed, all three of them give the opposite impression. Bartlett (2007, p. 6) further implies that public statements by John Kenneth Galbraith, appearing in the second half of the 1960s, were the "oldest expression" of the position that tax revenue drove spending the second half of the 1960s, and that they long preceded Friedman's own voicing of this hypothesis.

As will be shown below, these retrospectives are incorrect on the chronology of Friedman's adherence to the starve-the-beast argument. By 1978, he had, in fact, been subscribing to that argument for over fifteen years. And his earliest public statements on the matter preceded the Galbraith publications that Bartlett cites. As Friedman noted in November 1977, it was "long ago" that he "concluded that I am in favor of reducing taxes at any time under any circumstances for any excuse, that that's the only effective way to exert pressure on govt spending."[270]

The evolution of Friedman's position on spending and taxes

As of 1958, Milton Friedman's position was that the federal government's spending and taxes should both come down—but that the lowering of taxes should be made conditional on the delivery of expenditure reductions. It would be "highly desirable to reduce" the scale of the U.S. government budget, Friedman remarked in a 1958 talk. But he added that, as long as public spending remained at current levels, "it has been a good thing" that tax levels had been as high as they were.[271]

By the time of Friedman's delivery of this speech—November 1958—he likely had already had a conversation that year with Arthur Burns, in which Burns urged him to think in terms of the political and legislative mechanisms connecting increases in federal tax revenue and increases in

---

[269] Another study specifically concerned with "starve the beast"—Hageman, Arnold, and Sutton (2009)—incorrectly argues that Friedman did not articulate the view that government spending drove deficits any earlier than 2003. They also wrongly assert (p. 27) that (as of 2009) Paul Krugman had written more on the matter more than anyone else "in the public press" (i.e., the print and internet media). They reach this conclusion on the basis of their citation of four *New York Times* items by Krugman. In fact, Friedman's contributions to the press on the subject certainly exceeded this number. (The authors also, incidentally, incorrectly state on the same page that Krugman was a past member of the three-person Council of Economic Advis[e]rs to President Reagan." He was not, although he served on the CEA's *staff* during part of Reagan's first term.)

[270] *Milton Friedman Speaks*, Episode 6, "Money and Inflation," taped November 7, 1977, p. 37 of transcript.

[271] Friedman (1958d, p. 19). In the same vein, Friedman (1957b, p. 90) took it for granted that tax increases reduced the budget deficit.

federal government spending. As Friedman later recalled (Instructional Dynamics Economics Cassette Tape 129, September 13, 1973), Burns tried to persuade Friedman to support a tax cut to stimulate the economy. Friedman was ill-disposed toward fiscal-policy activism and believed, at this stage of his thinking, that budget deficits tended to be monetized.[272] Consequently, he resisted Burns' case. Burns sought Friedman's support by taking a political-economy angle: Would not a tax cut put pressure on Congress to cut federal government spending? Again, Burns was unsuccessful in bringing Friedman round to his side. "I did not buy that at that time," Friedman recalled of the political-economy argument. But he would have second thoughts after 1958.[273]

Burns' advocacy of tax cuts to restrain public spending

Burns' support in 1958 for a tax cut (though not the argument that it would put downward pressure on public spending) was noted in Stein (1969, p. 335). Burns does not seem to have taken the "starve-the-beast" line often in his public writings. Burns (1968a, p. 315 of 1969 reprint) stated that "federal taxes have in fact grown just about as rapidly as expenditures" over 1946 to 1967, but he sourced the former rise to the increase in government spending, which had "naturally resulted in much higher taxes." A clearer-cut statement was Burns' (1964, p. 30) observation regarding the tax cut of 1964: "One probable result is some curbing of the growth of federal expenditures."[274]

Notably, by 1968−1969, Burns had firmly shifted to the position that increases in government spending made tax increases appropriate. In this connection, Burns supported the 1968 tax increase (Burns, 1968b, p. 3) and he contended that "unless we bring government expenditures under better control... further increases in the level of taxation may become unavoidable."[275] Indeed, it was Burns' later position that taxes did, and should, adapt to spending behavior, rather than his previous starve-the-beast posture, that informed comments he made in 1978 regarding the Kemp-Roth bill. The Committee on Ways and Means of the House of Representatives had canvassed the reactions of many prominent economists across the country—Friedman notably

[272] Once more, see Friedman (1958d, p. 19). See also Nelson (2020a, Chapter 8).
[273] The quotation is, again, from Instructional Dynamics Economics Cassette Tape 129 (September 13, 1973).
[274] Also in the 1960s, Burns stated that the tax system "weakens the incentive to create and produce" (*Cleveland Press*, August 24, 1960) and (in a *U.S. News and World Report* interview cited in *First National City Bank Monthly Letter*, January 1969, p. 8) he suggested that it would be desirable to cut marginal tax rates every year.
[275] See Burns' remarks (given on December 2, 1969) in Burns (1978, p. 264).

not among them—to the Kemp-Roth tax-cut proposal.[276] Very few favored it unconditionally. Many opposed it, while Arthur Burns indicated he was in favor of the tax cut on the condition that it would be explicitly accompanied by an equal or larger cut in government spending: "if we now had a massive tax reduction that was not accompanied by a large reduction in governmental spending, the chances are that the effects would be serious; that is, that the rate of inflation would be magnified."[277]

But, whereas Burns during the 1960s had moved closer to straightforward fiscal-policy orthodoxy, including a more standard perspective on tax cuts, Friedman in the same decade had gone the other way. He had, belatedly, been won over by Burns' prior argument that tax cuts had merit as a means of encouraging government spending.

Friedman's adoption of the starve-the-beast position

"I personally have shifted views," Friedman acknowledged in 1972. "I used to say that we should first get spending down, and then cut taxes. And I now say, let's get taxes cut under any and all circumstances… because that's the only way you'll get spending down."[278] The position—known in later years as the "starve-the-beast" view, although Friedman seldom used that phrase—became a trademark Friedman argument.[279] In Congressional testimony on October 6, 1969, Friedman succinctly encapsulated both the positive and normative economic dimensions of the "starve-the-beast" position on the source of growth in government: "I do not believe that the level of federal spending or appropriations is independent of the level of tax receipts. In fact, I believe that the only effective method of cutting down government spending is by cutting taxes."[280]

---

[276] This volume—Committee on Ways and Means, U.S. House of Representatives (1978b)—was one of two books issued by congressional committees during 1978 (the other being Committee on the Budget, U.S. House of Representatives, and Committee on the Budget, U.S. Senate, 1978) that were made up of solicited submissions by economists giving their views on the Kemp-Roth bill and related proposals. Friedman was not one of the economists contributing to either volume. Nevertheless, his views on taxes were aired to a congressional committee in 1978, thanks to the fact that Milwaukee tax expert Arthur E. Friedman's testimony of January 16, 1978 (in Committee on Ways and Means, U.S. House of Representatives, 1978c, p. 415) gave two extended quotations from "Milton Friedman's article," specifically the Friedman *Newsweek* column of December 19, 1977. Having read out and endorsed these quotations, Arthur Friedman noted: "Incidentally, Milton Friedman is not related to me."
[277] In Committee on Ways and Means, U.S. House of Representatives (1978b, p. 28).
[278] *Firing Line*, PBS, January 5, 1972, p. 11 of transcript.
[279] Nelson (2009a, pp. 64–65) was an earlier analysis of the development of Friedman's views on the taxes/spending nexus.
[280] In Joint Economic Committee (1970a, p. 828). The prominence of the starve-the-beast component of Friedman's testimony was brought out in the headline given by the *Chicago Tribune* to its coverage of the testimony: "Cut Spending By Tax Slash—Friedman" (October 7, 1969).

That Friedman would take this position seemed jarring to many, as it was Keynesian economists who were perceived as the economists more accepting of budget deficits. Indeed, *Newsday* (November 5, 1968) had, as a means of contrasting him with the Keynesian stand on budget deficits, erroneously asserted that "Friedman is a pay-as-you-go man." But Friedman, while skeptical about the demand-boosting properties of budget deficits, had come to see deficits (or the prospect of them) as a potential restraint on the growth of public expenditure, and as therefore possessing what he saw as a desirable property.

The move to the starve-the-beast position marked something of a culmination of the evolution of Friedman's position on the roles of taxes. Kenneth Boulding's 1945 monograph *The Economics of Peace* had viewed the Keynesian revolution as having had the salutary effect of "get[ting] out of our heads that the primary purpose of taxation is to 'raise money for the government to spend,'" and of, instead, instilling the realization that "the true purpose of taxation [is] as the most powerful weapon in our hands for the stabilizing of money prices and incomes."[281] As discussed in Nelson (2020a, Chapter 3), during the Second World War Friedman had subscribed to the Keynesian view of taxes' function that Boulding described.

But Friedman's postwar research had dispelled his faith in the capacity of fiscal policy to stabilize (or, for that matter, destabilize) the behavior of prices. This research had also cast doubt on the importance of fiscal policy for the cyclical behavior of output. Having therefore eschewed what Boulding saw as the modern way to think about taxes, Friedman shifted, via his adoption of the starve-the-beast perspective, to the view of taxes' role that Boulding had treated as *passé*: that taxes financed spending. And if taxes financed spending, Friedman thought, control of taxes could be a device for controlling public expenditure. "I used to believe that we should first have fiscal responsibility, in the sense of getting rid of deficits before we reduce taxes," Friedman remarked in February 1972, before adding that this was something he no longer believed (Instructional Dynamics Economics Cassette Tape 93, February 23, 1972).

When did this shift occur? As already indicated, some accounts erroneously date Friedman's move to propounding the notion that tax revenues drive spending to as late as 1978. And, although some accounts have recognized his adherence to the starve-the-beast position was in force well before the decade of the 1970s, the precise point between 1958 and 1969 at which Friedman became a subscriber to the position has become a murky issue in the research

---

[281] Boulding (1945, p. 165).

literature, and an erroneous, later date has been nominated. In this connection, Romer and Romer (2009b) cite a 1967 Friedman *Newsweek* column (August 7, 1967) as his earliest use of the starve-the-beast argument.[282] In that column, Friedman had remarked, "If taxes are raised in order to keep down the deficit, the result is likely to be a higher norm for government spending." Friedman suggested that, further along the line, a fiscal deficit would then reemerge once spending reached a still-higher level, with fresh pressure to raise taxes then materializing.

Aside from this discussion, the year 1967—when a federal tax increase seemed to be in the offing, and in which Friedman had his newly-acquired outlet of a *Newsweek* column to discuss fiscal policy proposals—was one in which he made several other expressions of the starve-the-beast perspective. In a television appearance on January 10 discussing President Johnson's State of the Union address, Friedman stated that "the main effect of the tax hike will be, not to cut the budget deficit, but to raise spending" (*Sun News* (Las Cruces, New Mexico), January 12, 1967). At a Stanford University business-school conference in February 1967, he observed: "I don't believe it is wise to increase taxes, because the main result will be an increase in government expenditures. We're now spending too much, [and] taxes already are too high, not too low."[283] In his *Newsweek* column of October 30, Friedman remarked that the course of taxes "may affect the level of government spending."[284]

Prior to these 1967 interventions, however, the starve-the-beast argument had already been attributed to Friedman in the London press on the basis of a talk that Friedman gave in the city of Chicago on November 22, 1966 (reported in *Chicago Sun-Times*, November 23, 1966). In that talk (subsequently excerpted in *The Banker*, January 1967), Friedman had indicated that he "strongly opposed" a tax increase. "Postwar experience," he observed on the same occasion, "has shown that Congress will spend whatever the tax system will raise, plus a little more. Hence, I believe a tax rise would simply foster a higher level of government spending." The *Financial Times* writer Harold Wincott drew attention to this Friedman statement by quoting it in

---

[282] Ebenstein (2007, p. 167) also used this source. In stating that Friedman laid out the argument "as early as 1967," Ebenstein overlooks the fact that Friedman had, as noted below, been making the argument since the very early 1960s. Similarly, Rayack (1987, p. 188) implied that Friedman's use of this argument began only in 1967. The citation of Friedman's (1972c) *Economist's Protest* collection by Anderson, William, Wallace, and Warner (1986, p. 631) also indicated that they believed Friedman's starve-the-beast position originated in 1967 or later. The *Economist's Protest* collection included his 1967 columns endorsing that position, as well as a later one (July 15, 1968) in which Friedman had likewise stated that advancing the cause of tax cuts was "the only way to put an effective ceiling on federal spending."
[283] Reported the same day in *Oakland Tribune* (California), February 9, 1967.
[284] This aspect of Friedman's October 30, 1967, column was noted by Brill (1968, p. 4).

his column of January 3, 1967.

An observation in an article published in late 1967 by the junior U.K. Treasury economist, Stephanie Edge, provided a further indication that Friedman had used the starve-the-beast argument for some years. Edge (1967, pp. 202–203) stated that it was "*well known* that Friedman thinks that government expenditure is, to some degree, a positive function of tax revenue" (emphasis added). In documenting this point, Edge cited Friedman and Meiselman's 1964 *Review of Economics and Statistics* article. A footnote in this Friedman-Meiselman article had indeed stated that "since World War II… Congress seemed willing to spend whatever the tax system would raise plus a little more."[285] Friedman and Meiselman went on to cite Lewis (1964, p. 250) for empirical evidence on the matter.

The year 1964 does appear to be the earliest point at which Friedman made the starve-the-beast argument *in his writings*, not only in his article with Meiselman but also in his piece for the *New York Times Magazine* (October 11, 1964, p. 133), in the context of the Goldwater presidential campaign. He had also remarked in an interview early that year (*Freedom School Newsletter* (Colorado Springs, Colorado), March 1964, p. 4) that a tax "cut is desirable… to get the government smaller." But Friedman had deployed the argument earlier in the 1960s in other public statements and in conversations. An allusion to Friedman's views on the topic appeared in an October 8, 1962, *Financial Times* op-ed by Paul Samuelson, in which Samuelson referred (p. 8) to "the group who want to cut taxes in the hope that this will put pressure on the government to cut its expenditure."

Comparisons with Parkinson

The starve-the-beast argument had been made at length, some time before Friedman expounded it, by C. Northcote Parkinson, a writer who had achieved major success in the United Kingdom and the United States through a series of writings providing humorous social commentary. Parkinson (1960) had offered, as "Parkinson's Second Law," the regularity that "expenditure rises to meet income," and he attributed the twentieth-century increase in U.K. public spending to the growth in the central government's tax revenue.

Although they did not mention Parkinson in their 1964 joint article, both Friedman and

---

[285] Friedman and Meiselman (1964, p. 375).

Meiselman later acknowledged Parkinson's Second Law. For example, the March 1971 issue of the U.K. magazine *Management Today* reported (p. 146): "The fiscal theory of the monetarists has prompted Meiselman to propound 'Parkinson's Law of the Fisc.' This semi-serious law holds that the level of government spending rises to meet the available revenue."[286] In his *Newsweek* column of July 12, 1976, Friedman mentioned and quoted Parkinson (1960). And, on several occasions, Friedman credited the starve-the-beast argument to Parkinson. One such instance was in September 1974, when Friedman used the term "Parkinson's Law" to mean the Second Law.[287] Another was in his 1978 article on tax limitation in which Friedman stated: "I believe along with Parkinson that government will spend whatever the tax system will raise plus a great deal more."[288] A 1977 book chapter on U.S. social security was another discussion in which Friedman invoked Parkinson.[289] In that analysis, Friedman labeled the proposition that spending rises to meet revenue "Parkinson's Law," and he indicated that his own amendment to the law was to acknowledge that spending in practice often exceeds revenue, but that the volume of revenue nevertheless acts as a significant restraint on spending.

Prior to these references being given by Friedman, it was sometimes implied that Friedman did not acknowledge his debt to Parkinson: in Sonenblum (1973, p. 101), for example, reference was made to "this idea of Milton Friedman—which he apparently took from Parkinson." But before this Sonenblum discussion appeared, Friedman had actually stated (Instructional Dynamics Economics Cassette Tape 109, October 18, 1972): "as Parkinson tells us, government's expenditures rises to meet its income." Indeed, Friedman acknowledged his debt to Parkinson very early, and he seems to have been converted to the starve-the-beast view of spending determination not long after Parkinson's book appeared. In *Business Week* (May 6, 1961, p. 113), Friedman judged that U.S. federal spending behavior had been "Parkinsonian to a *T*." He indicated on that occasion that he now supported tax cuts even when these were not accompanied by an explicit plan to cut spending commensurately.

The year 1961, therefore, seems to when Friedman commenced his advocacy of tax cuts as a means of putting downward pressure on government spending. Another early public

---

[286] An example of the statements by Meiselman to which the article was referring was his Congressional testimony of October 13, 1969, in which he had referred to "the dilemmas posed by a Parkinson's Law of the Fisc that expenditures always rise to meet receipts." (In Joint Economic Committee, 1970b, p. 153.)
[287] Friedman (1974c, p. 76; p. 116 of 1991 reprint).
[288] Friedman (1978a, p. 12), reprinted in Friedman (1978a, p. 19). He had made similar remarks, including crediting Parkinson, in *New Guard*, April 1977 (p. 7).
[289] Friedman (1977p, p. 90).

endorsement he made of this idea was in December 1963: "I personally am now in favor of cutting taxes… [as] this is in the only way you will, in fact, get a cut in government spending." (*Christian Science Monitor* (Boston), December 5, 1963.) As already indicated, however, it was in 1967 that Friedman started becoming especially vocal in putting forward the revenues-drive-spending argument. Near, the end of that year, Friedman again drew upon it in a broadcast (December 24, 1967) of the revived *University of Chicago Round Table* radio program. After stating that postwar U.S. experience confirmed that tax revenue set a lower bound on federal spending, Friedman concluded that "if we want to keep down spending, we must keep down taxes."[290]

Starve-the-beast and beliefs in the size of the public sector

Those who shared Friedman's advocacy of restraint in government spending did not necessarily embrace his prescription regarding taxes. One notable dissenter with regard to Friedman's unqualified advocacy of tax cuts was Thomas Campbell. Friedman had been Campbell's faculty adviser when Campbell was an undergraduate student at the University of Chicago in the early 1970s. Campbell served in the U.S. Congress for most of the 1990s. As between deficit spending and tax-funded government spending, Campbell regarded the former as less undesirable. In addition, he eschewed reliance on tax cuts as a back-door way to restrain public spending. Campbell believed that the case for lower government spending should instead be made openly to the electorate—in a manner that allowed that case to be judged on its own terms. "If your real goal is to curb the size of government, you should try to do so and win on the merits. So, no, I did not believe in that. Running up the deficit and creating a fiscal crisis is not, to me, good public policy." (Thomas Campbell, interview, August 19, 2015.) On this view, tax cuts should not be called upon as a mechanism for holding down public spending even if, as a matter of positive economics, it was the case that revenues drove expenditures.

In the course of the aforementioned 1967 radio debate, Friedman acknowledged that one of his opponents in the debate—Robert Eisner—agreed with him on the positive-economics issue.[291] Indeed, just as Eisner had bridged the divide between Friedman and the Keynesians by incorporating the permanent-income theory into his analysis of the 1968 surtax, the very Keynesian Eisner found himself in agreement with Friedman on the position that tax receipts drove government spending. Eisner (1971, p. 77) stated, "in mathematical shorthand, $\delta G/\delta t$, the

[290] See the excerpt in *University of Chicago Magazine* (February 1968, p. 3).
[291] Again, see *University of Chicago Magazine* (February 1968, p. 3).

partial derivative of government expenditures with respect to tax rates, is positive. That is a fact that conservatives have known for a long time, but one which my liberal friends are sometimes reluctant to acknowledge. If the government is receiving more tax money, given the realities of the political world in which we live, it is likely to spend more."[292]

John Kenneth Galbraith was sympathetic to the position that tax revenue drove government spending. In contrast to Friedman, however, Galbraith regarded the regularity as a case *against* the cutting of taxes. He opposed both the Kennedy Administration's initial 1962 tax cut and the major 1964 tax cut of the Johnson Administration (*New York Times*, May 14, 1966). Robert Solow, a CEA member during the early Kennedy years, was aware of Galbraith's views on the matter during the internal governmental deliberations on the tax cut (Robert Solow, interview, December 31, 2013.) Indeed, although Bartlett (2007, p. 6) implies that it was only in the second half of the 1960s that Galbraith made known his disapproval of the tax cuts, along with the revenue-drives-spending basis for his opposition, Galbraith's position on this matter was publicly known during the first half of the 1960s, as both Galbraith's and James Tobin's subsequent commentaries on the matter (*in New York Times*, May 14 and 19, 1966, respectively) made clear.

Like Galbraith, Robert Eisner rejected the position that Friedman took that the realization that taxes drove public spending meant that taxes should be cut. Indeed, to those who favored greater government spending than Friedman did, the message of the argument seemed to be that raising tax revenues was an important requirement. That had indeed already been viewed as part of the realities of public finance by President Kennedy, according to the accounts of Walter Heller to which reference has already been made (those in Heller, 1966, p. 113, and *Sunday Times*, June 20, 1965). Heller recalled that Kennedy saw an elevated public-expenditure program as more politically feasible if it was proposed in the wake of a surge of tax revenue.

Friedman believed that this was also the political reality in the U.S. national discourse in the era after Kennedy's death. He attributed to President Lyndon Johnson the view that elevated tax levels needed to be maintained in order to promote high levels of public spending (Instructional Dynamics Economics Cassette Tape 11, January 1969). A particular development that Friedman would stress was the role played by the U.S. inflation over the 1960s and 1970s. As this took place in the context of unindexed income tax brackets, he saw it as an important source of growth in federal government spending—thanks to the fact inflation allowed tax revenue to rise

[292] The statement would have better relayed the point if "tax revenues" had been used instead of "tax rates."

in real terms.[293] He would repeatedly recall a remark that Senator Russell Long, of the U.S. Senate's finance committee, had made to him that the growth in the federal government's expenditure programs during the 1970s would not have been possible if the increase in the tax burden had had to be carried out via explicit legislation.[294] The developments of the 1970s would play a major role in making Friedman a very prominent advocate of tax cuts—as well as in leading him to support institutional limitations on tax revenue, of the kind implied by formal tax-limitation measures or by automatic indexation of tax brackets.

Friedman's affirmations of the starve-the-beast position, 1975 to 1978

The starve-the-beast posture remained a maverick position during the 1970s. A 1974 OECD publication, for example, presumed that the opposite view was correct when it observed that in recent years "the increase in proportion of GNP being absorbed by Government expenditures has led to high levels of personal taxation."[295] But as the federal government's spending and taxation shares had both risen since the 1960s, Friedman regarded his position as having been vindicated. Much fiscal policy analysis worked on the idea that government "expenditure is somehow independent of how much the tax system raises," Friedman observed at the American Enterprise Institute's panel discussion of indexation in mid-July 1974, and he believed that that position had been refuted by the fact that the shares had risen largely in unison.[296] Yes, he granted, the ratio of the federal budget deficit to national income had also risen. But, he noted, its rise had been in small in relation to the underlying tax and spending shares themselves.[297]

Friedman also reiterated the starve-the-beast view numerous times in his regular taped commentaries for subscribers. In this series, he remarked in 1974: "In the long run, Congress tends to spend whatever the tax system will raise, plus a good deal more."[298] In a 1975 entry, he affirmed: "I am in favor of cutting taxes under any circumstances for any reason or any excuse… because I believe that that is the only effective way really to cut government spending."[299] And, in late 1976, he again contemplated whether public spending was as high as it is primarily

---

[293] For an early expression of this position, see *Newsweek*, July 15, 1968.
[294] See Friedman's remarks in Snowdon and Vane (1997, p. 210) and O'Driscoll and others (1997, p. 8), as well as his April 1996 remarks at Claremont McKenna College (broadcast on CSPAN, December 26, 1996). Friedman and Friedman (1985, p. 44) recounted the anecdote without identifying the senator by name.

because of the tax revenue, and he stated: "My own conclusion… based… on a great deal of other material is that, on the whole, Parkinson is right when he says that spending rises to meet the income [that is, tax revenue, in the government's case] available."[300]

Friedman's reiterations of the starve-the-beast argument were so frequent in the six years through early 1978 that it is all the more surprising that multiple retrospectives have, as noted above, given him as articulating the position starting only in summer 1978 (or later). True, the audio commentaries just noted were not circulated widely. But the 1974 indexation debate was hardly low-profile: in addition to having audiotaped and printed versions, it was turned into a televised special. During 1972–1976, Friedman also articulated normative or positive versions of the starve-the-beast argument in his *Newsweek* column and in Congressional testimony in 1972–1976, as well as in further pieces that appeared in print during the same period.[301]

In early 1975, with tax cuts high on the national political agenda due to President Ford's proposed income tax rebate, Friedman criticized the specific proposal but added: "Our real concern should be, not the size of the deficit, but the size of government spending. If a tax cut, resulting in larger deficit, is a way to limit government spending, then I am for [it]." (*Journal of Commerce* (New York), March 4, 1975, p. 5.) In an interview two years later, he again confirmed that he was always in favor of cutting taxes in order to create pressure to restrain government spending (*New Guard*, April 1977, p. 7). And in his February 1978 speech on tax reform, Friedman remarked that in the wake of successive increases in taxes, "the result is higher and higher government spending."[302] In sum, there was a surfeit of public statements by Friedman before summer 1978 affirming the starve-the-beast argument.

And as the debate on the Kemp-Roth tax cuts proceeded in the U.S. press in summer 1978, two former heads of the Council of Economic Advisers indicated that they, too, rested their support for the Kemp-Roth bill on starve-the-beast arguments. As indicated earlier, by 1978 Herbert

[300] Instructional Dynamics Economics Cassette Tape 198 (September 1976, Part 1). Other audio commentaries over this period in which Friedman suggested that tax cuts promoted government spending restraint or that that tax increases would promote more public expenditure, or in which he reiterated his support for tax cuts at any time included Instructional Dynamics Economics Cassette Tapes 155 (October 10, 1974), 161 (January 1, 1975), 176 (September 1975, Part 2), 178 (October 1975, Part 2), 197 (August 1976, Part 1), 202 (November 1976, Part 1), 203 (November 1976, Part 2), 207 (January 1977, Part 2), and 213 (May 1977, Part 1).

[301] See Friedman's *Newsweek* columns of November 6, 1972, and May 12, 1975, and his testimony of June 21, 1973, in Joint Economic Committee (1973a, p. 130), and of January 22, 1976, in Committee on Banking, Currency and Housing, U.S. House of Representatives (1976, p. 2190). See also, in addition to the items already mentioned, Friedman (1974c, p. 85; p. 125 of 1991 reprint) and Friedman's 1972 discussion in Selden (1975, p. 195).

[302] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 10 of transcript.

Stein had been conscious for a quarter-century of arguments that federal tax cuts raised tax revenue. In a *Wall Street Journal* article that appeared at the height of that newspaper's Laffer-curve debate, Stein reaffirmed his skepticism about the article and indicated that his own analysis of a tax cut's effect, for given government spending, was similar to Walter Heller's. Nevertheless, Stein parted company with Heller on the desirability of a tax cut, as Stein saw a "simple and strong" case for passing the Kemp-Roth bill as resting on the likelihood that the resulting reduction in revenue would discourage new public-expenditure programs.[303] Similarly, Alan Greenspan stated (*Omaha World-Herald* (Nebraska), July 27, 1978) that provided "there is a political limit to deficit spending," it was the case that the "basic purpose of any tax cut program in today's environment is to reduce the momentum of [government] expenditure growth by restraining the amount of revenue available."

As for the term "starve the beast" itself, it was one Friedman largely eschewed. Nevertheless, and contrary to what some subsequent accounts have suggested, it dated back at least to the period of the late-1970s tax revolt. The terminology therefore predated the Reagan era, even though Bartlett (2007, p. 6) could not locate an instance of usage of it in the public record before 1985 and Paul Krugman (*New York Times* online, September 14, 2003) categorically, but erroneously, stated that "starving the beast" was a "phrase coined by David Stockman, Ronald Reagan's budget director."[304] In fact, in April 1979, a local Californian newspaper ran an article concerned with "the tax-cutting aftermath of Proposition 13" that quoted a local council member, Jerry Wilhelm, saying: "We must force governing boards to examine how money is being spent. 'Starve the beast' us the therapeutic result of Prop. 13." (*Argus-Courier* (Petaluma, California), April 11, 1979.)

Finally, it should be underlined that, despite his many enthusiastic statements about limiting taxes as a means of setting off political mechanisms that restrained public spending, this was not Friedman's preferred approach to lowering government expenditure. He continued to favor measures (with a particular preference, from the 1970s onward, for the method of constitutional

---

[303] *Wall Street Journal*, July 18, 1978, reprinted in Laffer and Seymour (1979; quotation from p. 53).

[304] Krugman made the same attribution of the phrase to David Stockman in *New York Times*, December 23, 2005—with Krugman claiming on that occasion that Stockman "memorably" deployed the phrase. D.H. Romer (1988, p. 63) earlier noted that the judgment that budget deficits engender spending restraint had been associated with Stockman by Senator Daniel Patrick Moynihan. Moynihan made this association in accounts reported in *New York Times*, July 11, 1985, p. A14, and *Washington Post*, January 14, 1993. In the first of these reports, Stockman also denied the attribution. Of the two news reports, the term "starve the beast" (or variants thereof) was only actually used in the latter, 1993 report, in which Moynihan used the phrase but made no claim that Stockman specifically deployed it.

amendment) that *directly* put limits on government spending—rather than relying on the indirect method of either tax cuts or tax-limitation amendments.

III. PERSONALITIES IN DEBATES ON REGULATION AND AGGREGATE SUPPLY, 1977–1978

JAMES DUESENBERRY

Friedman's proposals regarding the U.S. tax system, as expressed in his April 1976 *Newsweek* exposition of the case for applying a flat rate to American households, became a topic of discussion at an American Enterprise Institute conference, held in May 1976 in Washington, D.C.

Despite having an AEI affiliation over most of the 1970s, Friedman was rarely seen at AEI events during that decade, and he did not attend this particular conference, whose overall subject matter was income redistribution.[305] The conference's published proceedings, which appeared in 1977, showed the considerable attention that Friedman's column on tax reform had received at the conference—even though it had been an instance of popular writing and the AEI event had been a symposium showcasing applied research.

One of the notable commentaries on Friedman's piece recorded at the proceedings was that of James Duesenberry, professor of economics at Harvard University. Duesenberry indicated that he would likely differ from the column's degree of emphasis on efficiency as the criterion for designing tax reform. But he added: "I must confess that I have not read the article."[306]

Duesenberry's reaction captured three facets of his relationship with Friedman and with the macroeconomic debates in which the latter was engaged. First, Duesenberry had a posture that was largely one of opposition to Friedman. Second, unlike other high-ranking Friedman opponents, such as Paul Samuelson, Duesenberry was not heavily concerned with keeping tabs on Friedman's writings and with reacting to what he disagreed with in those writings. And third, by commenting on a Friedman piece that he had not read and doing so at a conference that

---

[305] It should be distinguished from a conference (mentioned in Section I above) on income distribution on January 29, 1977—one held at the Hoover Institution and which Friedman, who was then nearing the end of his first month in California, did attend.
[306] In Campbell (1977, p. 173).

Friedman was not attending, Duesenberry underlined the peripheral nature of the role that he and other Harvard University economists had ended up playing in the Keynesian-monetarist debates of the 1960s and 1970s.

Harvard University and the Keynesian-monetarist debates

"Since a number of the leading North American Keynesians were located MIT and Harvard, the early debate between monetarists and Keynesian economists was often characterized in geographical terms: Chicago versus Cambridge (Mass.)" That was the retrospective judgment of Sheffrin, Wilton, and D.M. Prescott (1988, p. 168).

There was some substance in this characterization. This is evident in the fact that in 1977, as noted above, Rose Friedman juxtaposed Cambridge and (the University of) Chicago as rival bases of U.S. macroeconomic opinion. And, certainly, the presence at MIT of such prominent Keynesians—and longtime sparring partners of Friedman—as Paul Samuelson, Robert Solow, and Franco Modigliani amply justified regarding Cambridge, Massachusetts, as a key base of Keynesian economics during the 1960s and the 1970s. But the size and prominence of this MIT contingent raise the question of how valid the "Chicago versus Cambridge (Mass.)" label was as an encapsulation of the Keynesian-monetarist dispute, as opposed to "the University of Chicago versus MIT." Specifically: Did Harvard University pull its weight sufficiently to consider it—rather than MIT alone—as contributing over this period to the perception that Cambridge, Massachusetts, was a hub for U.S. Keynesianism?

In the consideration of this question, it will be seen below that Harvard University's Duesenberry did, in fact, play some role in the Keynesian-monetarist debates of the 1960s and 1970s, and that his activities in these debates included direct engagements with Friedman. Nonetheless, very little of his direct disputation with Friedman reached print, and he and the other Harvard University economists of his generation did not come to be seen as major figures in the Keynesian-monetarist debates.

During the 1940s and 1950s, Harvard University was a major center when it came to the advocacy of Keynesian economics and to criticism of the quantity theory of money, thanks to the presence of Alvin Hansen. In the 1960s and the 1970s, however, economists who taught at the university tended to have a low profile in the Keynesian-monetarist debates. Duesenberry, who had been teaching at the university since 1946 (Committee on Banking and Currency, U.S.

Senate, 1966, p. 2; *Record American* (Boston), January 1, 1969), formed the closest to an exception to this generalization—not really because of direct debates with Friedman, but because of his prominent status as a Keynesian.

To be sure, among Friedman's contemporaries, there was another Harvard University economics professor who had a far higher profile than Duesenberry as an adversary of Friedman's: John Kenneth Galbraith. But Galbraith largely absented himself from the formal economic-research debates. Furthermore, Galbraith's views, areas of greatest interest, and his choice of publication outlets all put him at a distance from the macroeconomic debate taking place in U.S. academia. Among more orthodox economists at Harvard University, therefore, the leading macroeconomist in this period, was, indeed, Duesenberry.[307] He was also the leading proponent of Keynesian economics at the institution after Hansen stepped back.[308]

Duesenberry's most fundamental research contribution was work on consumer behavior, and he would be credited in that connection with having introduced the concept of habit formation. His major consumption work (Duesenberry, 1949) was interpreted by Friedman as implying a "relative income hypothesis" to which Friedman's permanent income hypothesis was a challenge.[309] But, in time, Duesenberry's main contribution to the theory of consumption has come to be regarded as reasonably compatible with Friedman's.[310] The models used today in benchmark New Keynesian analysis tend to embed habit formation into the representative agent's utility function, thereby embedding Duesenberry's habit-based theory of consumption

---

[307] During this period, Duesenberry also tried to keep Harvard University's economics department in the mainstream in the face of pressures to orient the department toward more radical or revolutionary economics. He made national headlines in 1973 when, as department chair, he was involved in discharging a couple of members of the department who had described themselves as developing a radical or Marxist critique of economics. Duesenberry was quoted as saying that the research output coming from this approach had not justified the department continuing the individuals in employment (*The Evening Star and Daily News* (Washington, D.C.), January 3, 1973).
[308] Franklin Fisher received his undergraduate degree from Harvard University in 1956, followed by a doctorate (see American Economic Association, 1970, p. 136). As an undergraduate, Fisher took courses from both Duesenberry and Alvin Hansen. He recalled Duesenberry as having given a "pretty good" course in macroeconomics. With regard to Hansen, Fisher observed: "I took one course from him [and] at that time I didn't think he was very good… He got mixed up a lot." Fisher further noted that "my recollection is that Galbraith was sort of certainly not central to the department." But he added that, on an occasion when he invited Alvin Hansen to an economics event organized by the students that Galbraith also attended, Fisher was struck by the extent to which Hansen regarded Galbraith as an heir: "Hansen basically said to Galbraith that he thought his most recent book was very good and we that didn't need any more of these [exercises in] mathematics. I was not impressed." (Franklin Fisher, interview, interview, January 16, 2015).
[309] See Friedman (1957a, p. 4).
[310] However, an article in the *New York Times* of June 4, 1995, was an example of a late discussion that, in arguing for the merits of Duesenberry's model of consumption, presented it as incompatible with the permanent income hypothesis (on which the piece offered a highly negative perspective).

into Friedman's permanent-income hypothesis (see, for example, Fuhrer, 2000; Christiano, Eichenbaum, and Evans, 2005).[311]

In U.S. economic policy, Duesenberry's credentials as a major Keynesian were cemented by his being a member (in 1966–1968) of the Council of Economic Advisers under President Johnson, and so he was one of those applying and expounding the "New Economics" in the national economic policy arena. At his confirmation hearing on January 20, 1966 (Committee on Banking and Currency, U.S. Senate, 1966, p. 3), Duesenberry observed: "I think that the basic ideas which go under the heading of the policy of new economics are very solidly based on the best kind of evidence that we can get—a great deal of it."

But as his participation in a 1969 conference (discussed below) attested, Duesenberry also worked in the field of monetary economics.[312] He taught in that area as the university's professor of money and banking (Duesenberry, 1983, p. 123) and, as noted in Nelson (2020b, Chapter 11), Friedman sent Duesenberry the 1961 draft of the Friedman-Schwartz *Monetary History* monograph. As was so often the case with Keynesians of his generation, Duesenberry found Friedman's work on consumption far more congenial than the Friedman research on money (Niels Thygesen, interview, February 10, 2015).[313]

The opposition to Friedman's monetarism coming from Duesenberry and other representatives of mainstream Keynesianism at Harvard University mainstream produced little of a legacy in terms of printed work. It became well established, nevertheless, thanks to oral traditions that proceeded in outlets that did not produce a written product. On the basis of his knowledge of the Harvard economics department of that era, Kenneth Arrow expressed confidence that "at Harvard they didn't take Friedman too seriously" (Kenneth Arrow, interview, December 7,

---

[311] The precise way in which habit formation is specified tends to differ across models—in particular, on whether the habit formation is based on so-called internal and external habits.

[312] This fact was stressed in his January 1966 confirmation process. A letter by Senator Edward Kennedy endorsing Duesenberry's nomination to the CEA (see Committee on Banking and Currency, U.S. Senate, 1966, p. 1) described him as "the author of a number of excellent books and articles on consumer and business theories, economic growth and monetary policies." In the confirmation hearing, Senator William Proxmire stated to Duesenberry: "You are an expert on monetary policy, too." (January 20, 1966, hearing, in Committee on Banking and Currency, U.S. Senate, 1966, p. 3.)

[313] A similar evaluation of the respective merits of different elements of Friedman's macroeconomic work was prevalent among Duesenberry's colleagues at the university. (Deirdre McCloskey, interview, August 17, 2015.)

Although he used the "permanent income" terminology (see Duesenberry, 1963, p. 21), Duesenberry himself does not seem to have been altogether won over by the logic of the permanent income hypothesis. Notably, even in 1983, he viewed the 1968 tax surcharge as effective in restraining aggregate demand and as leading, in conjunction with monetary restraint, to the downturn of 1970 (see Duesenberry, 1983, p. 135).

2013). Such a characterization is consistent with the statement of Wassily Leontief, a longtime presence in Harvard University's economics scene, that "I oppose Milton Friedman 100 percent."[314] In the same vein, the *New York Times* (January 25, 1970, p. 22) characterized Friedman as someone regarded as a heretic at both Harvard University and MIT. A negative attitude toward Friedman was conveyed at Harvard University in internal forums, including economics classes. McCloskey (2000, p. 68) recalled that "the best way for a professor to raise a laugh at Harvard in the 1960s was to mention the name of Milton Friedman." In addition, the campus newspaper *Harvard Crimson* (May 5, 1964) observed that Friedman was treated as a "bogeyman" in the first-year undergraduate economics course at the university.

But, of the economists at two universities, only those at MIT really prominently communicated their opposition to Friedman in print or in other major outside forums. In between Hansen's retirement and Benjamin Friedman's emergence, during the 1970s, in the field of monetary economics, the eminence of Harvard University in monetary debates receded. Francis Bator, watching developments from the vantage point of the university's school of government, observed: "Alvin Hansen, early on, played a major role at Harvard. [There was] Hansen, Arthur Smithies, and Jim Duesenberry but… it sort of thinned out on the macro side." (Francis Bator, interview, January 6, 2015.)

The consequence of this lull was that published debates between Milton Friedman and Harvard University figures were almost negligible. "After Hansen, Jim Duesenberry played an important role but wasn't first order in this [the Keynesian-monetarist exchange], and so in a way, the Harvard department played a lesser role." (Francis Bator, interview, January 6, 2015.)[315]

---

[314] Quoted in *Business Times* (Singapore), March 26, 1982. By the time he made this statement, Leontief was at New York University. However, he had worked at Harvard University from 1939 to 1975 (American Economic Association, 1981, p. 252).

Another longstanding Harvard University economist, Otto Eckstein, made a similarly negative judgment that "monetarist forecasting never was a serious undertaking" (Eckstein, 1976, p. 13). However, Eckstein qualified this statement with the acknowledgment that forecasts by Friedman and others using monetary aggregates had done better, during key points in the 1960s, than formal forecasts (of the kind with which Eckstein was associated) based on larger datasets and more elaborate econometric procedures.

[315] Another figure at Harvard University starting in 1962 (not at the department, but instead located at the business school) whose interests included monetary economics was Eli Shapiro. Shapiro had been an associate professor of economics at the University of Chicago's business school in 1946–1952, also serving as an editor of the school-managed Journal of Business, before being a professor of finance at MIT in 1952–1962 (see NBC, 1952, p. ii; American Economic Association, 1970, p. 396). Over and above his time at the University of Chicago, Shapiro had numerous occasions to interact with Friedman—he was a Columbia University graduate student in the late 1930s through 1945 (years during which Friedman was often also affiliated with the university), was deputy director of research for the Commission on Money and Credit, and participated along with Friedman in the conference recorded in Ketchum and Strunk (1965). However, Shapiro's specialities in economic research related to matters of corporate

This lesser role partly reflected the fact that, despite Duesenberry's undoubted contribution to macroeconomics, Harvard University in this era was not setting the pace in the monetary field or in economics more generally. Deirdre McCloskey attributed part of the reason for the low profile of Harvard University economists during the 1950s and 1960s, in relation to those at other institutions, to the fact that the Harvard University economists of the period tended to be technically outclassed. "I mean, Paul Samuelson ran rings around them. He ran rings around them [even] when he was there [as a graduate student]." McCloskey added: "The great success story of the Fifties in economics was MIT. And, if you can get beyond the ideology, the other success story, which became fairly obvious when I was there [1968–1980], was Chicago." (Deirdre McCloskey, interview, August 17, 2015.)

This status of Harvard University in economic research during the late 1950s and the 1960s, especially with regard to monetary economics, is brought out by the options facing David Laidler in 1960, when he chose graduate study at the University of Chicago. "I actually was offered money by quite a few places, and one of them was Harvard. If I had gone to Harvard, I would've taken price theory from Chamberlin, and macroeconomics from Leontief, and God knows what else. Chicago was offering me Milton for price theory, and Harry Johnson for [money/]macro, so I went to Chicago. I think Harvard was just tapped out, they needed renewing." Laidler affirmed that in Cambridge, Massachusetts, in the 1960s, when it came to research on macroeconomics and monetary issues, it was mainly the case that "the action was at MIT." (David Laidler, interview, November 6, 2014.)

Over the 1960s and the early 1970s, Harvard University did produce a number of Ph.D. graduates in economics—including Christopher Sims, Charles Goodhart, Donald McCloskey (later Deirdre McCloskey), John Eatwell, and Benjamin Friedman—who would become prominent critics of monetarism in the research and policy debates in the United States and the United Kingdom during the 1970s and 1980s.[316] But the university's researchers and teachers in

---

and international finance that had little to do with the Keynesian-monetarist debates. With regard to domestic monetary economics, the coverage of Friedman in the Eli Shapiro, Ezra Solomon, and William L. White (1968) textbook was light but not markedly negative. And, with regard to international monetary economics, the position that Shapiro took during the 1960s was similar to Friedman's, in favoring liberalization of the existing system (see, for example, Eli Shapiro, 1966). Indeed, a favorable attitude toward Friedman's position on international monetary arrangements—as distinct from his views on domestic monetary policy—was something that Lawrence Officer felt was pervasive also at Harvard University's economics department during the 1960s (Lawrence Officer, interview, January 10, 2016).

[316] Another prominent critic of monetarism, Fischer Black, was also a graduate of Harvard University in the 1960s, albeit with a Ph.D. in mathematics rather than economics.

economics during the heyday of the Keynesian-monetarist debate did not include an individual who had a role matching that of Solow, Samuelson, or Modigliani at MIT (or of Tobin at Yale University): that is, a figure who prominently and repeatedly challenged Friedman's views on monetary economics or on aggregate-supply issues in research journals or in macroeconomics-focused conferences.

Accordingly, in contrast with Friedman's frequent entanglements with MIT economists, Robert Solow observed, "I don't think that Milton ever had any close association with anyone on the Harvard faculty." Solow went on: "He certainly knew Duesenberry, and Duesenberry knew him—they were not strangers—but they were not people who would normally converse. Milton was certainly always much more in contact with Paul [Samuelson] or with me than with anyone at Harvard… I don't remember him ever giving a talk at Harvard, but I'm sure he must have. But he really was not close to anyone like John [H.] Williams, or Alvin Hansen, or as I said, Duesenberry, at all." (Robert Solow, interview, July 7, 2014.)

Friedman on Harvard University's Keynesians

Friedman, for his part, rarely referred to currently-active Harvard University economists when discussing monetary topics or aggregate-supply issues. But he did direct attention to older-vintage writings originating from Harvard University's: During the 1960s and 1970s, Friedman had a penchant for quoting some of the more hardline anti-monetary-policy statements of the university's prominent macroeconomists of the 1940s, Alvin Hansen and John H. Williams.[317]

Friedman nevertheless had considerable exposure to Harvard University economists on the

---

It should also be noted that three graduate students in economics at Harvard University during the 1960s, Robert Barro, Thomas Sargent, and David Sheppard, would in the 1970s become associated with the monetarist side of the Keynesian-monetarist debate (in Sheppard's case, in the U.K. version of the debate). Furthermore, Lawrence Officer, who over the 1960s was both a graduate student and an economics-department member at Harvard University, became sympathetic to Friedman's monetary economics after he left the university, as his own research findings made him more favorably disposed toward the monetarist position (Lawrence Officer, interview, January 10, 2016).

[317] See Nelson (2020a, Chapters 3 and 4). A remark that could be regarded as a sideswipe against Harvard University on Friedman's part was his endorsement (in *Newsweek*, September 13, 1982) of William Buckley's dictum that he would prefer to have his fate in the hands of the first 1,000 names listed in the Boston telephone directory than in the hands of the instructors at Harvard University. In this statement, however, Buckley apparently sought primarily to caution against reliance on elites rather than to cast aspersions on Harvard University (still less its economics department) specifically. Friedman's endorsement of the Buckley dictum could be interpreted in the same manner—although Friedman's own clashes with the university's economists on macroeconomic issues might have been an additional reason for his agreement with Buckley on the point.

conference circuit, and he in effect acknowledged the predominance of Keynesianism at Harvard University in a letter to George Shultz in July 1972. In that letter, Friedman expressed the assessment that only Dale Jorgenson (whose work on investment Friedman admired, and who in turn held the *Monetary History* in high regard) and Hendrik Houthakker (a former member of the Nixon Administration's Council of Economic Advisers) were the only people at the university who shared the general economic viewpoint that he and Shultz had.[318] Similarly, in a letter to Robert Barro of August 5, 1987, Friedman congratulated Barro on the latter's recent move to Harvard University's economics department but implied, in a jocular manner, that both he and Barro both had a longstanding adversarial relationship toward the macroeconomics prevalent at the university (Robert Barro, personal communication, March 12, 2019).

Duesenberry's research output and his interactions with Friedman

In a talk given in July 1981, Friedman came closer to identifying James Duesenberry specifically as one of his old sparring partners in the Keynesian-monetarist debate. "In preparing for this talk," Friedman observed, "I reread the proceedings of a conference held at Nantucket under the auspices of the Boston Federal Reserve Bank in June 1969. Out of that conference came a book entitled *Controlling Monetary Aggregates*. It was a depressing experience to reread those proceedings. The same people are now saying the same things they were saying then. The people who were then talking about the difficulty or impossibility of controlling the quantity of money through controlling the base are still saying much the same thing."[319] Though unnamed, the "people" to whom Friedman was referring were those contributors on the anti-monetarist side who were still active in the monetary field in 1981. These were: Paul Samuelson; James Tobin; Henry Wallich (in 1969 a researcher, in 1981 a policymaker); Sherman Meisel (in 1969 a policymaker; a 1981 a researcher)—and Duesenberry.

Duesenberry's article for the 1969 conference pointed to drawbacks of both interest-rate-oriented and reserves-oriented approaches to monetary policy, he singled out "a simplistic money supply policy" (p. 93) as particularly problematic.[320] He spoke more favorably of an "income-

---

[318] Friedman letter to George Shultz, July 2, 1972, in the Friedman archives at the Hoover Institution. By this time, Gottfried Haberler had left Harvard University. As discussed below, Haberler differed from Friedman on matters concerning inflation. However, on other monetary issues, they had agreement—including, as Friedman noted (Instructional Dynamics Economics Cassette Tape 9, January 1969) on fixed versus floating exchange rates.
[319] Friedman (1982a, p. 103).
[320] With regard to the *feasibility* of monetary-aggregate control, Duesenberry was less negative. However, Duesenberry (1977, p. 54) later stated that he believed central banks could achieve "as much control" over the money stock as they wanted only "over any decade (although not in the very short run)." This contrasted with

expenditure-credit conditions' approach to monetary policy" (Duesenberry, 1969, p. 94) that involved targeting forecast real output growth, based on the estimated gap between output and potential output, and that also took into account balance-of-payments considerations (pp. 93–94).

Other than this piece, Duesenberry's antagonism toward monetarism was expressed only sporadically in print. A skeptical, but not highly critical, published comment on Friedman's demand-for-money work had appeared as Duesenberry (1959). But that very brief discussion comprised almost the only case in which Duesenberry provided a sustained published scrutiny of Friedman's monetary contributions.[321] Indeed, when Duesenberry and Friedman were both participants in the 1962 NBER conference in Pittsburgh on the state of monetary economics, Duesenberry's paper—which opened the conference and appeared right before the famous Friedman-Schwartz "Money and Business Cycles" paper in the published conference issue in 1963—did not mention Friedman at all, despite being concerned with money demand.[322]

It is the case, though, that during the 1960s Friedman and Duesenberry were pitted against each other in a number of forums for which no proceedings volumes were published.[323] These included American Bankers Association conferences and consultants' meetings at the Federal Reserve Board. At the American Bankers Association meeting of 1963 or 1964, Friedman and Duesenberry debated the Friedman-Meiselman study of monetary and fiscal policy effects. Paul Wonnacott, an attendee of the conference, recalled: "Duesenberry was getting very red—I mean, he was clearly very angry. And he said, 'If you really want to know, Milton, that study just gives me one fat pain in the neck.'" (Paul Wonnacott, interview, May 12, 2014.)

Duesenberry had, by this point, likely been simmering about the Friedman-Meiselman paper for

---

Friedman's position that, in a fractional-reserves regime, monetary control was achievable over horizons of one to two quarters. Duesenberry's 1977 position therefore lined up with Friedman's (1982a) characterization of Duesenberry as one of those pointing toward the impossibility of money-supply control over the horizon Friedman believed achievable.

[321] A short introductory monograph on monetary matters that Duesenberry wrote (and that appeared multiple times in the 1960s and 1970s) mentioned Friedman (1960a) and Friedman and Schwartz (1963a) on the final page, with little comment, as further reading (Duesenberry, 1972, p. 136). The main text had made note of Friedman as "the best-known proponent of the quantity theory" (Duesenberry, 1972, p. 100) and acknowledged, but implied dissent from, the *Monetary History*'s position that monetary expansion could arrest depression (Duesenberry, 1972, p. 89).

[322] See Duesenberry (1963).

[323] Also in common with MIT Keynesians, Duesenberry is said to have reacted strongly and negatively to Gary Becker's work on the economics of the family. Indeed, Heckman (2014, p. 14) states that Friedman "frequently mentioned" a strongly negative presentation that Duesenberry made when he was the assigned discussant of Becker's work in this area at a 1959 event. However—as has been found in the case of Duesenberry's sparring with Friedman—Heckman notes that little of the Becker-Duesenberry contretemps actually made it into the published record.

a few years, as Friedman had presented an early version of it at Harvard University on February 17, 1960 (Tavlas, 2022, pp. 10–11).[324]

As already indicated, Duesenberry would later express his disagreement more openly in print, as in his contribution to the 1969 Federal Reserve Bank of Boston conference volume. That paper took issue with "the so-called monetarists" (Duesenberry, 1969, p. 87), although it did not refer to Friedman by name.[325]

Duesenberry on monetary policy

Although he disagreed with Friedman's conclusions about the importance of fiscal and monetary policy, Duesenberry was one of the Keynesians of his generation who (in contrast to the sometime practice of Okun and Tobin) in analytical work primarily treated the stock of money, rather than interest rates, as the variable set by the monetary authorities. Christopher Sims, a Duesenberry student during the 1960s, recalled that he took the same perspective in his own early work (such as Sims, 1972), "having been raised on actually Friedman, Modigliani, Duesenberry—all these guys treated *M* as a policy variable." (Christopher Sims, interview, March 15, 2013.) Consistent with this characterization, Duesenberry (1972, p. 4) stated: "The Federal Reserve System has the job of managing the money supply."

However, although he was not averse to viewing Federal Reserve policy in terms of its implications for monetary growth, it was far from the case that Duesenberry was sold on having U.S. monetary policy follow a monetary-growth rule, still less a *nonactivist* monetary-growth rule of the kind Friedman favored. Rather, when in 1969 he expressed the desirability of putting a "proposed course of action in quantitative terms," he indicated that this was "not necessarily [in] quantity of money terms" (Duesenberry, 1969, p. 94). Furthermore, as already indicated, he wanted the settings of monetary policy to be guided by the estimated size of the output gap and by a number of other policy objectives. It is clear, therefore, that although Duesenberry seemed willing to contemplate using the behavior of monetary growth as one criterion on which to judge

[324] Other than Duesenberry, another Harvard University macroeconomist with whom Friedman had numerous interactions was Francis Bator. Bator (who also had close past links with MIT, having studied and taught there) was also one of the few Cambridge, Massachusetts-based economists whom Friedman saw frequently after the Friedmans gave up their New England summer home in 1979–1980. In the 1980s, Bator and Friedman would continue to see each other regularly because they went to the same location, at the same time of year, for their annual skiing vacation in Alta, Utah. (Francis Bator, interview, January 6, 2015.)
[325] Duesenberry (1969, p. 87) did refer to Brunner and Meltzer, albeit without a bibliographical citation. Meltzer was Duesenberry's discussant at the conference (see Meltzer, 1969).

monetary policy stance, he explicitly favored an activist, countercyclical reaction function. And he continued to believe that monetary policy should be based on setting interest rates, even if, at a theoretical level, he continued to cast policy decisions in quantity-of-money terms.

This approach on Duesenberry's part was evident in formal policy advice he gave to the Federal Reserve during the 1970s. Although he was never a policymaker or any other kind of full-time Federal Reserve official, Duesenberry had, by the time of the 1969 Federal Reserve Bank of Boston conference, acquired a semi-permanent Federal Reserve affiliation. He had been made, beginning at the start of the year (*Record American* (Boston), January 1, 1969) a member of the board of directors of the Boston reserve bank. His membership of this board stretched through the first half of the 1970s, and one part of the job involved meeting with the Federal Reserve Bank of Boston's president, in the lead-up to the latter's attendance of the regular FOMC meetings in Washington. In these consultations, Duesenberry would discuss the appropriate setting of monetary policy. He continued to interact with successive bank presidents long beyond his period as a bank director: indeed, Duesenberry's was noted even in late 1996 as involved in discussions with the Federal Reserve Bank of Boston's president on current monetary policy (see Federal Open Market Committee, 1996, p. 10).[326]

A summary of Duesenberry's advice on monetary policy during the first half of 1975 was circulated to the whole FOMC (see Federal Reserve System Staff, 1975a, 1975b, 1975c). In these 1975 consultations, Duesenberry called for the Federal Reserve to produce higher rates of monetary growth.[327] Those prescriptions were in line with the fact, noted above, that Duesenberry was agreeable to thinking in terms of monetary policy in terms of monetary aggregates. His recommendations for monetary policy in early 1975 were, in addition, not altogether dissimilar to those Friedman was making at the time. As discussed in Chapter 5 above, Friedman was critical of the Arthur Burns-led FOMC for letting monetary growth fall to unduly low rates in the second half of 1974, and he had called for prompt actions to bring monetary growth up. Consequently, both Duesenberry and Friedman were recommending a major easing of monetary policy, registered in more rapid monetary growth.

A significant difference, however, between Duesenberry's 1975 recommendations and those

---

[326] Even in a 2006 Federal Reserve Bank of Boston volume—recording a June 2004 conference at which Duesenberry was a discussant on the program—it was indicated that Duesenberry "currently serves on the Bank's academic advisory council" (Kopcke, Tootell, and Triest, 2006, p. 359).
[327] See the attributions to Duesenberry in Federal Reserve System Staff (1975a, p. 3; 1975b, p. 3; 1975c, p. 3). The quotations in the next paragraphs are from the first two of these sources.

Friedman was making was in the role assigned to interest rates in policymaking. Whereas Friedman favored dropping the federal funds rate instrument as part of a monetary targeting strategy, Duesenberry wanted targeting of the funds rate to be maintained. Indeed, in calling for a move to expansionary policy, he specified specific values of the funds rate that he wanted the policy of higher monetary growth to achieve. in his January 1975 consultation Duesenberry indicated that monetary growth should be raised from present levels but that this should be accomplished by changing policy settings promptly "to get the funds rate down to 6 percent and hold it there." This remained his advice in February, when the federal funds rate was still above 6 percent. On that occasion, Duesenberry was reported indicating that "open market rates should be [brought] down a bit more and kept there" and indicated that he would be comfortable if this policy resulted in the increase in the budget deficit being, in effect, accommodated by money creation.

The FOMC did, in fact, largely keep the federal funds rate at 6 percent or below until September 1977, late in Arthur Burns' tenure as Federal Reserve chair. By the time of the FOMC's late-1977 move to tighten its policy, the second monetary explosion of the 1970s had, as discussed in the previous chapter, been taking place over most of the preceding two-and-a-half years. Evidently, although it had likely appropriate in early 1975, the policy of moving rates into a lower range had been kept in force for too long and, ultimately, revived double-digit inflation. A policy—one more in keeping with Friedman's focus on monetary growth than with Duesenberry's recommendation of keeping the federal funds rate at 6 percent—that allowed short-term interest rates to start increasing prior to 1977 would evidently have been more consistent with avoiding an untoward revival of monetary growth and consolidating the disinflation that began in 1975.

It might be contended that, although Duesenberry's policy recommendation in the mid-1970s likely led to a less appropriate policy stance for that period than Friedman's would have, the overall *approach* to monetary policy that Duesenberry articulated had similarities to today's prevalent views about the setting of monetary policy. Indeed, although Friedman indicated that he found that the article made depressing reading, Duesenberry's 1969 piece on monetary policy targets and tactics contained points that have become prominent ones in the discussion of monetary policy conduct, including the concern that the stabilizing tendencies of monetary-growth rules would be compromised by "shifts in the money demand function" (1969, p. 83) and that the setting of rates should recognize that "the interest rate required to produce any target

GNP is constantly changing (p. 91).[328] In keeping with his 1975 policy recommendation, Duesenberry's preferred framework had elements that were, in some ways, modern: adjustable nominal interest-rate targets geared to final objectives, interest rates being kept down for stretches of time during the initial recovery from a perceived sharp downturn, and monetary growth being allowed to vary in response to money demand shocks.

Such an interpretation of Duesenberry's policy framework is, however, undercut by a major flaw in his analysis—his dismissal of the importance of a point Friedman had stressed: the distinction between real and nominal interest rates. "It is fashionable nowadays to emphasize the distinction between real and nominal interest rates. I doubt whether the concept of real interest rates has any real usefulness in short-run policymaking," Duesenberry (1969, p. 89) declared, while adding that "there is no well-defined empirical meaning to a real rate of interest." These were jarring statements—essentially implying that nominal, not real, interest rates, were what mattered for the behavior of private-sector spending—and they reflected a crucial omission in Duesenberry's analysis. They also revealed an issue on which Duesenberry's approach contrasted greatly with Friedman's way of seeing things. Overlooking, or abstracting from, the nominal-rate/real-rate distinction when specifying the IS-curve relationship was a shortcoming of traditional IS-LM analysis that Friedman highlighted. With regard to modeling the behavior of saving (and so of consumption) and investment, Friedman remarked in the early 1970s: "Omitting the real interest rate in that process is to leave out Hamlet. [A]nticipations of inflation… seem to me too important and too central to be pushed off stage…"[329]

By 1977−1978, the downplaying, of the sort in which Duesenberry engaged in 1969, of the nominal/real interest-rate distinction that Duesenberry endorsed in 1969 had become uncommon. Rather, in economic analysis, emphasis on the Fisher distinction was prevalent—thanks to the monetarism's influence, the rational expectations revolution, and the evolution of data in the United States and elsewhere. A prominent exception to this pattern, however, came in 1978 in a *Brookings Papers* article by Duesenberry's younger colleague at the Harvard University economics department, Benjamin Friedman.[330] Benjamin Friedman (1978a, pp. 600−601)

---

[328] With regard to the first of these points, Duesenberry's concern that "there do appear to be significant shifts in velocity" produced by instability in money demand (1969, p. 92) appears to have been much less empirically important for the decade of the 1960s than he thought at the time.
[329] Friedman (1971g, p. 330). Also in Friedman (1971a, p. 40).
[330] Benjamin Friedman had become a member of the department of economics at Harvard University in 1972, his first position being that of assistant professor (American Economic Association, 1970, p. 152; B.M. Friedman, 1975, p. 277). By November 1976, he was an associate professor in the department (see Committee on Banking, Housing and Urban Affairs, U.S. Senate, 1976b, p. 81).

undertook policy analysis using an algebraic IS-LM setup of the kind Milton Friedman had criticized: one in which the nominal interest rate entered the IS equation in its own right (that is, without expected inflation being subtracted from it).[331]

Furthermore, in work published the same year, Benjamin Friedman (1978b) studied the relationship between short-term nominal market interest rates and inflation in his empirical work. He documented the point—one that has continued to be accepted as a key fact of the United States experience in the 1970s—that nominal rates in the 1970s had not kept up with inflation in practice in the 1970s in the United States. Specifically, he found that interest rates responded by only two-thirds of one percent to a one-percentage-point rise in expected inflation. In contrast to modern-day interpretations of this phenomenon in the 1970s data, Benjamin Friedman interpreted it primarily as a financial-market reaction, not a policy decision: "It is a truism that, for expectations of price inflation to affect interest rates, they must affect the behavior of borrowers or lenders or both."[332] That is, the incomplete adjustment of nominal interest rates to expected inflation was implied as being a pricing decision made by the private sector as a whole. Interpreted in that sort of framework, Benjamin Friedman's finding that interest rates responded only two-thirds of one percent to a rise in expected inflation might have been seen as having provided support to the doubts Duesenberry expressed about the practical importance of the concept of the real interest rate.[333]

There is, however, a different way of interpreting the non-adjustment of nominal interest rates: it reflected easy monetary policy. That is, it resulted from the holding-down of nominal interest rates by the Federal Reserve, in the face of upward pressure arising from the Fisher-effect mechanism. In terms of Benjamin Friedman's "truism," private-sector lenders were pricing the Fisher effect into nominal interest rates, but the central bank's creation of reserves (as well as its actions generating the creation of outside money) created new loanable funds that offset or even overwhelmed the Fisher-effect forces pushing up interest rates. This was Milton Friedman's

---

[331] Congressional testimony that Benjamin Friedman gave in November 1976 was consistent with a position that aggregate demand depended negatively on the absolute level of nominal interest rates. In November 1976, the U.S. short-term real interest rate was around zero—both the federal funds rate and inflation being slightly below five percent. Starting from this position, Benjamin Friedman's advice was "to avoid significant increases in market interest rates... Substantial increases in market interest rates beyond current market levels would be damaging to the economy and would serve little purpose in terms of avoiding further increases in price inflation." (From B.M. Friedman's testimony of November 15, 1976, in Committee on Banking, Housing and Urban Affairs, U.S. Senate, 1976b, pp. 75, 76.)

[332] B.M. Friedman (1978b, p. 845).

[333] Even on this interpretation of Benjamin Friedman's results, however, a full vindication of Duesenberry's (1969) contention would have required a zero, not just an incomplete, response of interest rates to expected inflation.

interpretation of developments during the 1970s, and it also became the standard one.[334]

Milton Friedman was mainly referring to short-term interest rates in his accounts, while Benjamin Friedman (1978b) was studying longer-term rates. However, this difference still does not seem to validate Benjamin Friedman's implication that the onus was on market participants to make nominal rates adjust to inflation, and that the absence of such adjustment cast doubt on the presence of the Fisher effect. Instead, easy money likely kept longer-term nominal interest rates low in relation to inflation. Via the standard expectations theory of the term structure, central-bank efforts to hold down nominal interest rates at the short end of the term structure will be felt to some extent in the lack of full adjustment to inflation (or, equivalently, unusually low real interest rates) at the longer-term end too. And vitally, the conditions of excess demand prevailing over the 1970s are more consistent with easy money than tight money—with real interest rates pushing up demand, rather than with high nominal interest rates restraining it. In contrast to Duesenberry's dismissal of the real/nominal interest rate distinction, Milton Friedman's emphasis on the real rate as the driver of spending decisions appears to have been vindicated.

And Duesenberry would soon appear out of touch when he declared in his 1969 paper: "In practice, I know of no case when it can be said that an easy money policy, by itself, set off an expansion process which raised interest rates."[335] The United States' experience in the 1960s and 1970s provided many such cases. So, well before the 1960s, had the experience of many other countries.

Duesenberry and aggregate-supply relationships

Duesenberry would later categorize "inflation theory" as among his research interests.[336] His statements on this topic during the 1970s would, however, not be ones that stood up well in retrospect. Just as he was slow to grasp the importance, for the analysis of U.S. monetary developments, of the nominal-rate/real-rate distinction, Duesenberry articulated—in his writings and statements over the course of the 1970s—views about aggregate-supply relationships that the economics profession would, within a few years, deem obsolete.

---

[334] See Chapters 2 and 5 above.
[335] Duesenberry (1969, p. 86).
[336] American Economic Association (1993, p. 135).

Duesenberry was at least not a proponent of hardline pure cost-push views of inflation. Nevertheless, the conception of aggregate-supply relationships that he expounded during the 1970s diverged greatly from the expectational-Phillips-curve/monetary-phenomenon view of inflation that Friedman advocated and that would ultimately prevail as the consensus view. Duesenberry started out the decade articulating permanent-tradeoff views of the Phillips curve. In a November 1970 speech in Boston, he discussed the relationship between inflation and unemployment: "Dr. Duesenberry appeared pessimistic on achieving full-employment and price stability at the same time."[337] Duesenberry, who gave 4 percent as the full-employment unemployment rate (itself a rate that would increasingly become regarded in official circles as too low an estimate), specifically gave 1.5 percent inflation as achievable with 5 to 5.5 percent unemployment and suggested that 4.5 percent unemployment rate implied a 3.5 percent inflation rate (*Boston Herald Traveler*, November 10, 1970).

Duesenberry had occasion to state his revised views of the unemployment/inflation relationship four years later, at a November 1974 conference whose proceedings were published in 1977.[338] Although he no longer expressed matters in terms of a straightforward downward-sloping Phillips curve, Duesenberry still seemed to believe that positive cost-push shocks continued to make price stability and full employment incompatible. He acknowledged that the central bank could indeed, through monetary control, secure a long-run inflation rate it desired (Duesenberry, 1977, p. 54), but "any reasonably acceptable level of employment" would require a notable degree of inflation: "There is a continuing conflict between employment objectives and price stability objectives." A solution would require addressing "all those special microeconomic problems that tend to generate inflation."[339]

Duesenberry and the Federal Reserve chairs, 1977–1978

It was from this perspective—according to which inflation largely reflected nonmonetary factors—that Duesenberry approached the setting of U.S. monetary policy in 1977 and 1978 under Federal Reserve chairs Burns and Miller. Duesenberry viewed the imperative as being to use monetary policy to reduce the unemployment rate, and he shared the administration's belief in these years that demand stimulation, not restraint, was needed. "I don't foresee that Burns

---

[337] *Boston Herald Traveler*, November 10, 1970. The same news report used Duesenberry's position as chairman of the Federal Reserve Bank of Boston's board of directors to give misleadingl descriptions of him as "a top government economist" and even as "Fed Chairman."
[338] On the November 1974 date of the conference, see Krause and Salant (1977, p. vii).
[339] All the quotations are from Duesenberry (1977, p. 55).

will, in fact, drive interest rates up at a rapid rate. And in don't see the [Carter] Administration's policy as being so much more aggressive than seems reasonable to me or reasonable to Burns." (*Boston Globe*, November 25, 1977.) A month later, Burns' replacement by William Miller was announced. Duesenberry had the background of having known Miller from their period of overlap as members of the Federal Reserve Bank of Boston's board of directors.[340] At the time of Miller's nomination, Duesenberry saw easy monetary policy as being necessary—as well as likely to occur under the new chair. Miller, he predicted, would assign himself the task of "eliminating unemployment" (*New York Times*, January 3, 1978, p. 47).

In the event, as discussed in the previous chapter, unemployment did fall during Miller's tenure, but his period as Federal Reserve chair was characterized by successive tightening steps, and Miller would acknowledge that some of the generally higher U.S. unemployment rate seen in the 1970s reflected a rise in the natural rate of unemployment. The Federal Reserve under Miller's tenure would move away from views of the kind Duesenberry propounded, and toward acceptance of inflation as a monetary phenomenon and of the reality that the U.S. economy was in a situation of excess demand—not of major slack.

JAMES SCHLESINGER

Like James Duesenberry, James Schlesinger had a deep background in the Harvard economics world. In Schlesinger's case, however, this background consisted of having been a student, not a teacher. Schlesinger had acquired his bachelor's, master's, and Ph.D. degrees from the university in 1950, 1952, and 1956, respectively.[341]

During the 1950s, Schlesinger devoted considerable research effort to macroeconomic topics. One of the most prominent results of this was the publication, at roughly the same time as his receipt of a doctorate, of a *Quarterly Journal of Economics* article, "After Twenty Years: *The General Theory*."[342] The article's title and subject matter made it, in effect, a follow-up to a ten-year retrospective on Keynes (1936) penned by Gottfried Haberler, who was a member of Harvard University's economics department during Schlesinger's studies.[343] In common with both Haberler and Friedman, the writings on macroeconomics that Schlesinger produced in this

[342] See Schlesinger (1956).
[343] For Haberler's ten-year retrospective, see Haberler (1946, 1947). Haberler was at Harvard University from 1936 to 1971 (see American Economic Association, 1981, p. 178).

period took a position critical of Keynes' downgrading, in the *General Theory*, of the role that monetary policy could play in avoiding and ending depressions. Again like Haberler, but *unlike* Friedman, Schlesinger was a believer in cost-push forces as a major, and persistent, influence on U.S. wage and price pressures.[344] His 1956 doctoral dissertation was specifically concerned with this topic, and in a 1958 paper Schlesinger observed of developments in the United States since 1956: "The Consumer Price Index has climbed steadily upward… without a noticeable excess of demand."[345]

Through the very early 1960s, Schlesinger was evidently trying to stake out a particular position for himself in U.S. macroeconomic debate: the exponent of a middle ground between the hardline Keynesianism seen in the United States before the 1950s (which had featured of a full-fledged cost-push perspective on inflation, outside excess-demand conditions, and a downplaying of the role that monetary policy played in influencing total spending) and the position that Friedman had established by the mid-1950s (in which cost-push forces were rejected as a significant influence on inflation, and emphasis was placed on monetary policy as the key instrument available to the government for shaping aggregate demand).[346] But Schlesinger, despite a prominent academic location—he was at the University of Virginia from 1955 to 1963—had trouble distinguishing himself in the economics profession on these matters.[347] The "partial cost-push" view of inflation to which he subscribed was quite prevalent in U.S. Keynesianism in the late 1950s, as was some recognition of monetary policy's importance in the determination of aggregate demand.[348] Schlesinger consequently found it hard to make himself a central player in macroeconomic discourse in the late 1950s and early 1960s or to establish himself as Haberler's counterpart among the younger generation of economists.

Nor, despite clear attempts to do so, did James Schlesinger emerge as one of Friedman's major opposite numbers on matters concerning monetary policy, the business cycle, and inflation. His efforts in this direction including his declaring with regard to Friedman, in the course of an

---

[345] Schlesinger (1958, p. 312). Schlesinger's dissertation, completed in 1955−1956, was titled "Wage-Cost Price Relationships and Economic Progress" (see American Economic Association, 1970, p. 386, and *https://www.worldcat.org/title/wage-cost-price-relationships-and-economic-progress/oclc/76998246&referer=brief_results*).

[346] See, in addition to Schlesinger (1958), Schlesinger's (1960a) taking issue with hardline U.S. Keynesian Seymour Harris for his inconsistency and for his dismissal of a role for monetary policy in affecting inflation (p. 614), while also rejecting Friedman's advocacy of policy rules (p. 616).

[347] At the University of Virginia, Schlesinger was an assistant professor from 1955 to 1958, then an associate professor from 1958 to 1963 (see American Economic Association, 1970, p. 386).

[348] See Nelson (2020a, Chapter 10).

analysis of unions and inflation in Schlesinger (1958, p. 297), "we will concentrate on his views," and his subsequently publishing, soon after its appearance, a review of Friedman's 1960 book *A Program on Monetary Stability* (see Schlesinger, 1960b). But the journal in which Schlesinger's book review appeared (*Rivista di Diritto Finanziario e Scienza della Finance*) was an obscure one, even by the uncrowded standards of the early 1960s. Friedman was one of very few who ever cited Schlesinger's review when he fleetingly referred to it in 1961. And that 1960 article was virtually Schlesinger's final attempt to maintain a presence in the field of monetary economics.[349]

More than fifteen years later, in 1977 and 1978, the tables were turned. In terms of Schlesinger's career path, his period of closely monitoring Friedman's work had become a distant element in his rear-view mirror. He had now been himself nationally famous for several years, and he had moved to a situation of having little occasion to refer to Friedman at all. When Schlesinger (1977, p. xiii) remarked on "the stirring quotations from Milton's *Aeropagitca*," it was with reference to the poet Milton. In contrast, during these same two years of 1977−1978, Friedman was following Schlesinger's public remarks more closely than ever before.

Since the early 1960s, Schlesinger and Friedman had both moved from the research world to the public-policy world—completely so, in the case of Schlesinger. In 1977 and 1978, Schlesinger was a leading figure in U.S. national policy formation and commanded attention, and Friedman who would be in the position of repeatedly reacting to Schlesinger's activities and of discussing Schlesinger's statements, past and present.

This turnabout had its origins in Schlesinger's decision during the 1950s to split his research time between two distinct fields: macroeconomics and the economics of defense. It was in applying economic analysis to national-security matters that Schlesinger was much more successful in commanding attention than he would be in his endeavors in monetary economics. An early Schlesinger product the area of defense was his 1960 book, *The Political Economy of National Security*.[350] His decision to specialize on the economics/defense interface was reflected in his subsequent move to the Rand Corporation, in which Schlesinger served in senior positions from 1963 to 1969.[351] He left the Rand Corporation when the bridge he had built for himself

[349] For Friedman's reference to the review and its "misconceptions," see Friedman (1961c, p. 447).
[350] See Schlesinger (1960c). The book was reviewed in the London *Financial Times* (October 24, 1960) by Friedman's former student, Samuel Brittan.
[351] See American Economic Association (1970, p. 386) and Europa Publications Limited (1986, p. 1430).

between economics and national security led to a role in government that concerned both areas. He joined the Nixon Administration as assistant director at the Office of Management and Budget from 1969 to 1971. There followed a further series of appointments under Nixon that were specifically in the security realm: head of the Atomic Energy Commission from 1971 to 1973, director of the CIA from February to May 1973, and then U.S. Secretary of Defense starting in mid-1973.[352] But Schlesinger's career in national policymaking seemed to have come to an unceremonious end when President Gerald Ford dismissed him as defense secretary in November 1975.

In late December 1976, however, President-elect Jimmy Carter announced that he planned for Schlesinger to head the making of energy policy in his administration. The New York *Daily News* applauded the announcement. In an editorial (December 24, 1976), the newspaper pointed to Schlesinger's experience in national-security and defense positions as "just what the energy post needs" and suggested that energy policy required the nation "to mount a massive effort, on the same scale and pushed with the same vigor as our post-Sputnik space program."

To Friedman, however, the notions that energy was a matter that demanded a government-orchestrated collective effort, and that concerns regarding high oil prices or limited energy supplies needed to be primarily viewed in national-security or national-planning terms, were misconceived. As he saw it, what was needed was the removal of federal government controls on the energy market, so that price signals could trigger appropriate responses of private-sector energy demand and supply. Neither high current energy prices nor concerns about future supply volumes were problems to be seen as a major government-planning tasks or ones for which skills in U.S. foreign or defense policy provided an ideal fit.

The "moral equivalent of war" and the Department of Energy

The Carter Administration, however, was going in a different direction from a market-based response—as was brought out in two televised addresses to the nation that President Carter gave on the topic of energy in February and April 1977.[353]

---

[352] See Europa Publications Limited (1986, p. 1430). Friedman's former student Warren Nutter also followed an evolution from academic economics to defense roles in the Nixon Administration. Despite these parallels in their career trajectories, Nutter and Schlesinger did not get along at all (Jane Nutter, interview, April 21, 2014).

[353] The two talks (Carter, 1977b, 1977c) have sometimes been conflated. For example, Eizenstat (2018, pp. 165–166) very specifically identifies the second talk—on April 18, 1977—as delivered by Carter in a cardigan by the fireplace. This attire was actually used by Carter in his earlier (February 2, 1977) speech. The April 1977

In the February 1977 address, Carter indicated that he would be asking Congress to authorize the creation of "a new energy department," with its own representative in the president's cabinet. Carter cited the existing multiplicity of agencies having responsibility for energy policy and pointed to a single department as being able "to bring order out of chaos."[354] Friedman, who had wanted the main existing energy regulator/planner—the Federal Energy Agency—abolished, was appalled at the prospect of that agency, instead, being the chrysalis from which a new, full-scale government department emerged. In a *Newsweek* column, "A Department of Energy?," that appeared after Carter had formalized his request for the new body, Friedman declared that an energy department would "control the lifeblood of our economic system," and concluded: "Make no mistake about it. The establishment of a Department of Energy… would be a further major step toward converting our free-enterprise system into a corporate state." (*Newsweek*, May 23, 1977.)

There was, however, widespread Congressional support for a Department of Energy, and when this was created later in the year, James Schlesinger became Secretary of Energy. This would make him the only person who served in the cabinets of all the U.S. presidents of the 1970s.

Even prior to his return to cabinet, Schlesinger had been a formal member of the Carter administration, in his role as the assistant to the president on energy matters from January to August 1977 (Europa Publications, 1986, p. 1430). Carter had remarked in his February 2, 1977, speech that a comprehensive energy policy would be unveiled within a few months, and "Dr. James Schlesinger, who is assistant to me here in the White House, will be in charge of developing that new energy policy." The National Energy Plan—what Friedman would later label the "Schlesinger-Carter energy program" (*Newsweek*, October 17, 1977)—was accordingly unveiled on April 18, 1977. Over the following six months, Schlesinger, as the principal designer of the plan and head of energy policy in the administration, made a very large number of appearances at Congressional hearings and other public events in which he explained and promoted the plan.[355]

It was, however, Carter who first issued the plan publicly, in his April 1977 address to the nation. Friedman was incensed by a much-quoted passage of this speech. Applying to energy a phrase

---

address was given by Carter from the Oval Office, in a business suit (see, for example, *The Decatur Daily* (Tennessee), April 19, 1977).

[354] Carter (1977b).

[355] For accounts of internal deliberations that have confirmed Schlesinger's status as the main orchestrator of the April 1977 National Energy Plan, see Biven (2002, p. 157) and Eizenstat (2018, pp. 150–164).

that was already long in use, the president likened the policy and community response envisioned in the plan to "the moral equivalent of war." Specifically, Carter stated: "This difficult effort will be the 'moral equivalent of war,' except that we will be uniting our efforts to build and not to destroy."[356]

Once stripped of its military component, the war analogy implied an imperative for an overtly collective response by the U.S. citizenry, with the aim of achieving a common purpose. In the same vein, James Schlesinger, in testifying for the plan, characterized the task as to "provide a challenge to the American people to meet a common goal."[357] Friedman regarded this whole approach as misconceived.[358] "There is fundamentally no moral problem involved whatsoever," Friedman contended (Instructional Dynamics Economics Cassette Tape 212, late April 1977). "… Moral values don't have anything to do with the fact that we are faced with scarcity, that we have the problem of how a limited supply of oil is allocated among various people." The parallel with war and the reference to morality were not appropriate to apply to this matter, which was instead best viewed as a "strictly technical economic problem" (*Newsweek*, June 13, 1977).

In light of Friedman's continuing diagnosis of the problem as economic, his advice and diagnoses during 1977 and 1978 paralleled those he had made since 1973: a decentralized market solution, guided by the price system. His associated policy prescription was, therefore, simple: "eliminate price controls on natural gas and on oil, let the market work."[359] The National Energy Plan eschewed this approach, as will now be discussed.

Natural gas crisis

"Jimmy Carter, before he was elected, said he was going to decontrol," Friedman observed in a 1979 interview that was concerned with new turmoil in supply conditions at U.S. gasoline stations (*Today* show, NBC, September 28, 1979). Carter's remarks before the 1976 election had, however, mainly limited advocacy of energy price decontrol to *natural gas* prices—indeed, Carter had explicitly endorsed continued regulation of domestic petroleum prices. In an

[356] See Carter (1977c). Also quoted in *The Decatur Daily* (Tennessee), April 19, 1977.
[357] From Schlesinger's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 118). Schlesinger's testimony also repeated President Carter's "moral equivalent of war" formulation (p. 117). Perhaps fittingly in light of the parallels with war that it contained, this testimony was given on the day on which the film *Star Wars* premiered in Washington, D.C., and elsewhere in the United States.
[358] See also the discussion in Nelson (2020a, Chapter 9) as Friedman's warnings against trying to apply wartime notions of a common goal to economic policy in peacetime.
[359] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 23 of transcript.

interview appearing in October 1976, Carter remarked: "There is no need to deregulate the price of old oil. The price of all domestic oil should be kept below that of OPEC oil. However, our natural gas supply is rapidly approaching critically low levels. Under the present regulated price structure, producers who attempt to exploit these deeper wells are forced to take a loss... We need to deregulate the price of gas for five years, with presently existing contracts remaining in force."[360]

In the event, a crunch on natural gas supply of the kind that Carter foreshadowed emerged promptly. It occurred just before he took office. The severe winter weather that the United States experienced in the early weeks of 1977 gave rise to what Friedman, in his postmortem on the episode, described as "widespread shortages of natural gas, leading to compulsory rationing and the closing of schools, factories and other establishments." (*Newsweek*, February 28, 1977.)

Friedman's column was titled "Gas Crisis: Weather Or Washington?"—and, as Carter had in his interview, Friedman focused on the hindrance to supply associated with natural-gas price ceilings. The winter natural gas emergency occurred against a background of a highly regulated market—one that Friedman in late 1977 characterized as featuring a "crazy-quilt" set of arrangements that "beggars description for its absurdity."[361] Although domestic production dominated U.S. gas supply—implying that the supply side of the market was dissimilar to the oil market—the natural gas market shared with oil the feature that it was subject to federal price control. In particular, natural gas produced in its state of use was priced freely, but the price of gas that was traded in interstate transactions was subject to federal price control. Friedman's column acknowledged that, irrespective of the presence of controls, the winter weather would have caused hardship and disruption. But the physical shortages of natural gas that various U.S. states experienced, he suggested, could be laid at the door of federal price controls, which largely prevented gas consumers from making purchases from out-of-state sources at a price higher than $1.42 per unit (*Newsweek*, February 28, 1977).

When Carter in 1976 endorsed deregulation of natural-gas prices, he in effect made this policy bipartisan, as President Ford had been seeking such price deregulation repeatedly since 1974.[362]

---

[360] Carter (1976). See also the quotation from the 1976 Democratic party platform given in Chapter 6 above.

[361] Friedman (1977a, p. 24). Friedman had previously deployed the "crazy-quilt" label in reference to the natural-gas market's pricing system in *Newsweek*, February 28, 1977.

[362] See, for example, Ford (1976b). Paralleling their treatment of oil, the federal authorities drew an "old gas"/ "new gas" distinction. In contrast to oil, for which "new" product was subject to price controls only starting in late 1975, both old gas and new gas were subject to federal price controls by the time Ford took office, and Ford's deregulation proposals in this area (like Carter's in 1976) pertained solely to the new-gas price. Although he wanted all price

Indeed, Friedman had thought, incorrectly as it turned out, that a gas-price deregulation bill that Ford supported in early 1976 would get through Congress (Instructional Dynamics Economics Cassette Tape 185, February 1976, Part 1). And one of Carter's selling points for his own promises on energy was that he would be able to secure gas-price decontrol when Ford had not (Eizenstat, 2018, p. 144).

Once, however, the natural-gas issue moved to the forefront of U.S. policy debate in the early months of 1977, the matter of deregulation ceased to be one of bipartisan agreement, for Carter retreated from his support for deregulation. He was persuaded to do so by James Schlesinger—who had relayed, in a briefing, given on March 14, 1977, to cabinet and other high-ranking administration officials, his conclusion that "the free enterprise system would not alone solve our problem" on natural gas.[363] When, two months later, he testified publicly about the administration's National Energy Plan, Schlesinger conceded that "there is no question that the pattern of federal controls in the past has intensified the shortages and the distortions in the natural gas market."[364] However, he also affirmed that the National Energy Plan reflected the administration's judgment that it "reject[ed] the proposition that unconstrained prices in an alleged free market… is the appropriate answer to the current problem."[365]

Instead, the plan proposed to eliminate the intrastate/interstate gas-price distinction not by deregulation, but by the imposition by the federal government of a price ceiling ultimately

---

controls on natural gas removed, Friedman largely accepted that the terms of the public debate centered on new gas prices, and he welcomed the (ultimately unsuccessful) efforts that Ford and members of Congress made during the mid-1970s at securing deregulation of new-gas prices (Instructional Dynamics Economics Cassette Tape 155, October 10, 1974; Instructional Dynamics Economics Cassette Tape 185, February 1976, Part 1).

[363] Eizenstat (2018, p. 152).

[364] Testimony of May 12, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, p. 227).

[365] Testimony of May 12, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, p. 70). As part of the argument against deregulation, Schlesinger raised the possibility that, if prices had not been controlled during the natural gas emergency earlier in the year, the price of natural gas might have spiked to around $5.50 (see Committee on Interstate and Foreign Commerce, U.S. House of Representatives, 1977b, pp. 71, 219, and his testimony of May 25, 1977, in Joint Economic Committee, U.S. Congress, 1978b, p. 9). This conjecture was likely based on a scenario in which interstate natural-gas prices were only decontrolled once the emergency began. Friedman's *Newsweek* column (February 28, 1977) on how market pricing would have better handled the winter weather was instead mostly based on comparing actual events with a situation in which all gas pricing had been decontrolled long enough for the free pricing system to have exerted an important influence on supply conditions. However, in Instructional Dynamics Economics Cassette Tape 207 (late January 1977), he contemplated a scenario in which prices were decontrolled during the emergency and suggested that the decontrolled price would not have had to rise too much above the existing (market-determined) interstate prices, as "many gas wells are located in places where there is no demand for them for intrastate use." He also pointed out that the authorities had temporarily relaxed the enforcement of price controls as one of their means of increasing gas supply during the recent emergency.

applicable to both intrastate and interstate transactions of $1.75 per unit (rising to about $2.15 in 1980).[366] When pressed on the fact that this represented a retreat from Carter's deregulation pledge, Schlesinger acknowledged that the plan indeed embedded a view that "there must be a cap" (that is, a mandatory price ceiling) but maintained that the plan could be seen "as a first step toward deregulation" because it raised the ceiling prices for natural gas and created conditions under which the gas market could operate on a national basis.[367]

But it certainly was not a free-market solution, even in the long term—Schlesinger described "market pricing of natural gas" as something that did not occur even at the end of the plan's implementation—but instead a proposal that involved a controlled-price national market.[368]

Even before the unveiling of the National Energy Plan in April confirmed the administration's rejection of gas price decontrol, signs that Carter would retreat from his pledge to deregulate the gas price had been discernible in his early weeks in his office. Friedman remarked in late January when Friedman anticipated that notwithstanding "all the fine talk about deregulation by both Mr. Ford and Mr. Carter" during 1976, it was unlikely that 1977 would see natural gas-price deregulation. Furthermore, by the time Friedman held a press conference on February 9 in the Los Angeles area, Carter had signed a bill to address the natural gas crisis via increased federal powers over the direction of the country's gas supplies (see Carter, 1977c). "Instead of energy legislation, the government should have abolished price ceilings," Friedman remarked (*The Herald* (Arlington Heights, Illinois), February 11, 1977). "There have been winters as cold as this before, but this is the first cold snap during which … the price[s] of gas and oil [are] determined, not by the free market, but by government fiat." He suggested that the right inference had not been drawn from the experience: "Amazingly, however, the result of all this is not, as one would expect, that people wake up and say, 'Boy, is this a stupid system.' Instead,

---

[366] See, for example, Schlesinger's testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate (1977a, p. 46), of May 12, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, 101, 218–219), and of May 25, 1977, in Joint Economic Committee, U.S. Congress (1978b, p. 8). As an interim measure, the plan would place a ceiling price on interstate natural gas of $1.42, below the $1.75 ceiling proposed on intrastate gas. See items numbers 42 and 43 in the official "Proposals in the National Energy Plan" (submitted by Schlesinger in his testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate, 1977, p. 9).

[367] The quotations are from Schlesinger's testimony of May 12, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, p. 226). For Schlesinger's claims that the bill was market-friendly, in improving production incentives and ending the intrastate/interstate market distinction, see, for example, his remarks on pages 68–70 of the same hearings volume, as well as his statement that the bill would, partly through higher taxes, "have prices reflect replacement costs" (p. 217).

[368] From Schlesinger's testimony of May 12, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, p. 70).

they say, 'The government should have still more power.'" (*Los Angeles Times*, February 10, 1977, Section 2, p. 12.)

In the event, the convoluted congressional processing of the natural-gas component of the National Energy Plan led to a separate, gas-focused bill that was more deregulatory in its long-run aspects than the administration had proposed. In February 1978, Friedman was pessimistic enough to declare: "I doubt very much that we will ever get complete decontrol of oil and gas prices."[369] But, by late that year, the gas bill had evolved into one that would deregulate newly discovered natural-gas prices in early 1985. This bill was passed, and President Carter signed into law as the Natural Gas Pricing Act of 1978.[370]

The date of deregulation was so far off—near the very end of President Carter's permissible time in office, if he served a full eight years—that there was considerable skepticism that the deregulation decision would stick.[371] Furthermore, the incentives the bill gave to supply in the interim were criticized, for example by Senator Russell Long, as inadequate (*Kansas City Star* (Missouri), September 7, 1978). And the new law extended the reach of price controls before removing them, as the administration's recommendation of extension of federal controls to intrastate prices was also accepted. This aspect of the legislation so incensed Kenneth Arrow—like Friedman, an advocate of energy price deregulation—that his own account of energy developments referred to the act's medium-term extension of price controls and not to its ultimate decontrol provisions.[372] Friedman was likewise unimpressed, as the natural-gas bill

---

[369] *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 32 of transcript.
[370] Carter's (1978b) remarks at the signing suggested that the bill reflected his 1977 plan and made no mention of the fact that in 1977 he had excluded price deregulation from his proposals. A more plain-speaking assessment was that made in retrospect by the president's domestic policy adviser: "he abandoned his campaign pledge to decontrol newly-discovered natural-gas prices, but finally [in 1978 he] embraced it" (Eizenstat, 1978, p. 211).
[371] The far-off character of the date of deregulation was noted at the bill's signing by Representative Harley Staggers, who joked that synthetic fuels may have rendered natural gas obsolete by the time deregulation became operative (see Carter, 1978c). The leadup to 1985 was also associated with calls to expedite and extend natural-gas price deregulation. For example, Charles J. DiBona (president and chief executive officer of the American Petroleum Institute) stated in an April 15, 1983, speech, "Energy: The Lessons Learned," to the Cleveland City Club Forum: "Specifically, I'd like to reverse our current policy [of] controlling through federal regulation the price of natural gas." (In part, this was clearly a reference to the control, not expiring in 1985, of the price of "old" gas.)
[372] See Arrow and Kalt (1979, p. 3). Arrow's emphasis on these intermediate-term features of the new natural-gas law was not altogether out of step with what Schlesinger himself emphasized about it in the leadup to its passage. When interviewer Jim Lehrer noted to Schlesinger, "When all this started many months ago, the original administration bill, of course, did not call for deregulation of natural gas [prices]," Schlesinger replied: "I think that this is good legislation... It has essentially the price trends that the president recommended eighteen [sic; sixteen to seventeen] months ago: [it has] a slightly broader definition, but it includes expansion of [price] controls to the intrastate market, as he requested. In 1985, controls are scheduled [in the bill] to come off. I think that our energy

crystalized, by the fact that "the so-called gas deregulation compromise" actually involved additional price regulations for the next six years. Their imposition, he suggested, "would certainly reduce the efficiency and output of that part of the gas industry now free from control, the intrastate market."[373] The 1985 decontrol of natural gas prices envisioned in the 1978 act did go ahead, however, and this outcome meant that the 1978 legislation did come to be seen as primarily ushering in deregulation.[374]

Energy plan or tax plan?

Once the natural gas emergency of early 1977 had receded, matters concerning oil pricing and U.S. oil dependence returned to the forefront of discussions of energy policy. It was a set of proposals concerning oil that formed the main elements of the National Energy Plan. The bad news for proponents, like Friedman, of a freely determined domestic oil price was that the plan eschewed this idea. The energy-industry newspaper *The Oil and Gas Journal*, (April 18, 1977, p. 1) accurately predicted, on the basis of a leaked draft of the plan: "President Carter's long-awaited energy message… proposes a permanent system of price controls on crude oil."

Friedman focused on oil policy in the *Newsweek* column he wrote after Carter's April 20 announcement of the plan. On this basis, he judged the plan "a monstrosity." Friedman also expressed disappointment with the plan's principal designer: "James Schlesinger is a highly trained and intelligent economist. He knows better." (*Newsweek*, May 2, 1977*a*, p. 21.)

The plan's orientation toward government targets regarding the private sector's usage of particular classes of energy—targets whose achievement would partly be achieved through edicts—was anathema to Friedman. The *status quo* for the United States prior to the announcement of Carter's plan, he remarked, was that "you have handcuffs on the production, distribution, and use of oil through government controls."[375] Instead of retreating from such a system in favor of a more decentralized and market-oriented solution, the plan sought to widen government direction. "The problem in energy is the extent to which the government has

---

problems today are sufficiently serious that I am not going to spend a great deal of time on theological issues involving 1985." (*MacNeil/Lehrer News Hour*, PBS, August 31, 1978.)

[373] Letter (of August 22, 1978) to Senator Clifford P. Hansen (in *Congressional Record—Senate*, September 11, 1978).

[374] See "An Overview and History of Gas Deregulation" (*https://liheapch.acf.hhs.gov/dereg/gasoview.htm*). This source also notes that price deregulation in the case of "old" gas followed later, in legislation passed in 1989.

[375] *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 32 of transcript.

interfered with the market," Friedman remarked in the wake of the president's April speech. "And Mr. Carter's 'solution' is to interfere still further." (*Democrat and Chronicle* (Rochester, New York), April 22, 1977.)

In testifying on the plan, James Schlesinger claimed that measures in the plan would "eliminate government regulation."[376] But this claim mainly rested on the fact that the plan envisioned conditions in which the entitlements program involving oil refiners might be phased out. Similarly, when Schlesinger stated that the plan relied on "a minimum of direct government regulation" and "attempted to avoid mandating major changes in the economy," he was apparently merely referring to the fact that compulsory measures pertaining to household behavior was largely absent from the plan.[377] The plan *did* envision increased mandatory measures being applied to firms: as John F. O'Leary, the head of the Federal Energy Administration, testified: "We have proposed measures that, if enacted, will require industry to do certain things."[378] Giving testimony to the Joint Economic Committee about a month after the plan was released, Otto Eckstein summarized his own assessment: "The president's program substantially increases the amount of regulation imposed on the economy."[379] Friedman concurred: as he put it bluntly the following September: "The Carter energy program, I think, will be another disaster."[380]

True to its self-description as a plan, the Carter program aimed to achieve numerical totals pertaining to the private sector's use of specific fuels by the mid-1980s. For example, in addition to seeking reduced oil consumption and importation, the plan contained a sub-program that Schlesinger called the "coal conversion program."[381] He characterized this measure as facilitating an "expansion of the use of coal" in the United States as part of "a switch from oil

---

[376] From Schlesinger's testimony of August 8, 1977, in Committee on Finance, U.S. Senate (1977a, p. 7). The entitlements program was discussed in Chapter 6 above.
[377] The quotations are respectively from Schlesinger's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 116) and of August 8, 1977, in Committee on Finance, U.S. Senate (1977a, p. 55).
[378] From O'Leary's testimony of September 19, 1977, in Committee on Energy and Natural Resources, U.S. Senate (1977b, p. 107). Similarly, Schlesinger acknowledged: "For the industrial and utility sector, the [proposed] national energy act contains… regulatory measures." (From page 118 of his written testimony of May 25, 1977, in Joint Economic Committee, 1978b.)
[379] From Eckstein's opening statement for the hearing of May 20, 1977, in Joint Economic Committee (1978b, p. 5). This passage also appeared in the written version of his remarks (p. 13). Eckstein's stress on the plan's shortcomings in his testimony at this hearing contrasted with his initial reaction, which had been contrasted in the press with Friedman's by the headline: "Eckstein: It'll Work; Friedman: A Disaster" (*Democrat and Chronicle* (Rochester, New York), April 22, 1977).
[380] *Milton Friedman Speaks*, Episode 12, "Who Protects the Consumer?," taped September 12, 1977, p. 28 of transcript.
[381] See, for example, Schlesinger's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 131).

and gas to coal [reflecting its status] as our most abundant resource."[382] The specific target enumerated in the plan was: "Increase coal production by about two-thirds, to more than one billion tons annually"—and Secretary of the Treasury Blumenthal noted that the plan entailed that "we are really going to triple the use of coal for industrial uses."[383] Friedman lamented the fact that in the plan, public "utilities are going to be required at almost whatever cost to convert to coal, [while] factories are going to be prevented from using oil and, if not, they're going to be required to pay a very high tax."[384]

Indeed, various prominent features of the plan led Friedman to judge that it was really a tax program, rather than a program directed at the energy problem.[385] The criticism had substance in the fact that taxes figured very prominently in the program: the official list of its initiatives began with "1. Gas guzzler tax. 2. Standby gasoline tax."[386] Secretary of the Treasury Blumenthal himself said of the National Energy Plan: "It is, in many ways, a tax plan."[387] Although the administration advertised as a feature of the program a commitment that proceeds of energy taxes would be rebated to the public, Otto Eckstein judged that the proposed remittances would not achieve this aim. "In fact," Eckstein testified on May 20, 1977, "the money will not be [fully] recycled to the public. The federal government will keep quite a few billions for meeting, in fact, the general needs of the budget."[388]

Appearing as number 39 in the official list of the plan's proposals was "Crude oil equalization tax [COET]." Despite being catalogued below so many other items in the plan, the COET—also called the wellhead tax—was, in effect, as the Congressional Budget Office's Alice Rivlin would note, the "cornerstone" in the plan's aims for the pricing, consumption, and importation of oil.[389]

---

[382] The two quotations are both from page 7 of Schlesinger's testimony of May 3, 1977, in Committee on Energy and Natural Resources, U.S. Senate (1977). A few weeks later, Secretary of the Treasury Blumenthal similarly stated that the conversion scheme reflected the fact that "there is a general view… that we have other sources of energy such as coal… and that we ought to emphasize those while we economize, that that is the right approach." (Testimony of May 25, 1977, in Joint Economic Committee, 1978b, p. 104.)
[383] The quotations are drawn from item number 101 in the official "Proposals in the National Energy Plan" (submitted by Schlesinger in his testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate, 1977, p. 10), and from Secretary Blumenthal's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 100).
[384] *Milton Friedman Speaks*, Episode 12, "Who Protects the Consumer?," taped September 12, 1977, p. 27 of transcript.

[387] From Blumenthal's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 61).
[388] In Joint Economic Committee (1978b, p. 3).
[389] From Rivlin's testimony of September 16, 1977, in Committee on Energy and Natural Resources, U.S. Senate (1977b, p. 3).

The COET element of the package was a feature that added credence to Friedman's accusation that the plan was a tax-increasing package. Senator Joseph R. Biden, Jr. (D–DE) commissioned a Library of Congress analysis of the likely revenue that the COET would generate, and in mid-September 1977 he released the finding that the estimated revenue generated by the tax by 1985 was $19 to $30 billion—well above the administration's $12.2 billion figure.[390]

The COET was notable also for the fact that it reflected the administration's rejection of crude-oil price deregulation. Whereas the Nixon and Ford administrations had proposed moving from domestic oil price control to a program of decontrol accompanied by new energy taxes, the Carter Administration's National Energy Plan proposed the COET, a tax, as something to be employed in the oil market alongside permanent price control.

Perpetuating price controls

In one of his many Congressional appearances regarding the plan, Schlesinger claimed that it would institute "a rational pricing system," and in another he stated that "this program is basically the one that reflects… the use of the price mechanism."[391] Similarly, FEA Administrator O'Leary Administrator testified in June 1977 of the conditions that would flow from implementation of the plan: "The marketplace for crude oil will be returned to its pre-price-controls state…"[392] These statements gave the impression that the plan would institute decontrol of the price of crude oil produced in the United States. In fact, that move was notably absent from the National Energy Plan. Instead of decontrolling oil prices, the plan proposed to maintain, in perpetuity, price control on all the main categories of domestically produced crude oil that were currently subject to control and, within the confines of those controls, to make the path followed by the ceiling price somewhat lower—that is, more restricted—for most domestic oil. As Friedman put it in a September 1977 discussion of the plan, one of its properties was that "price controls are going to be kept."[393]

[390] See Committee on Energy and Natural Resources, U.S. Senate (1977b, p. 82).
[391] The quotations are from testimony Schlesinger gave on May 3, 1977, and on June 1, 1977, in Committee on Energy and Natural Resources, U.S. Senate (1977a, p. 7) and Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, p. 5), respectively.
[392] From O'Leary's testimony of June 23, 1977, in Committee on the Judiciary, U.S. Senate (1978, p. 26).
[393] *Milton Friedman Speaks*, Episode 12, "Who Protects the Consumer?," September 12, 1977, p. 27 of transcript. Similarly, Alice Rivlin of the Congressional Budget Office observed: "The administration's plan would retain controls on prices received by domestic oil producers." (Testimony of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives 1977a, p. 131.) See also the September 1977 Rivlin remark on price controls that is quoted below.

As far as Friedman was concerned, price controls were the "ultimate source of the whole energy problem," and Schlesinger's background in economics should have led him to an energy proposal that used the price mechanism and decontrolled energy prices.[394] Instead, the oil price controls originally imposed in 1971, and retained with modifications in the years since, would, under Schlesinger's proposals, be made permanent. What had been called old oil—that oil output generated by a U.S. well in place by 1973 that did not exceed the well's 1972 production levels—would still have its price held down to its middle-single-digit level—about $5.18 in 1977 (Sweeney, 1977, p. 185). And in the case of what had been customarily called new oil—oil generated at wells developed since 1972, or production at pre-1973 wells that exceeded 1972 levels—price control would, as had been the case since 1975 (see Chapter 6 above), also continue to be in force: the existing control system implied that the price of such new oil in 1977 was, at $11.28, about $2.25 below the world market price.[395]

Furthermore, under the plan, not only would these prices not be deregulated, but the previous legal provisions for some real increases in the controlled oil prices would be eliminated. Mid-1970s legislation had allowed the maximum prices for old oil and new oil to be raised by up to 10 percent per year. Under the National Energy Plan, this provision would be dropped, in favor of permanently restricting the increases after 1977 to the general inflation rate. As the Carter Administration in 1977 (erroneously, and in contrast to Friedman's projections) thought that the U.S. economy would experience inflation well below double digits in the coming years, this change was intended to mean, as Schlesinger confirmed in testimony, a lower ceiling over time on old-oil and new-oil prices than implied by the arrangements in place before the plan.[396] The upshot was, as Alice Rivlin of the Congressional Budget Office noted: "To oil that is already flowing, the producer's price would be frozen at the present level, except for adjustments for inflation…"[397]

Domestic oil arising from very new discoveries—defined as oil discovered after the National Energy Plan's public release in mid-April 1977—would, under the plan, be allowed to rise to the market price prevailing in 1977, and the producer would receive that price. But such product

[394] The quotation is from *Milton Friedman Speaks*, Episode 12, "Who Protects the Consumer?," September 12, 1977, p. 26 of transcript.
[395] See the testimony of James Schlesinger of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977b, p. 4).
[396] See Schlesinger's testimony of August 8, 1977, in Committee on Finance, U.S. Senate (1977a, p. 12).
[397] From Rivlin's testimony of September 16, 1977, in Committee on Energy and Natural Resources, U.S. Senate (1977b, p. 4).

would not be allowed to reach this price fully in 1980.[398] And, as discussed further below, this price would still a controlled price—one mimicking the 1977 world market price plus an adjustment for U.S. inflation over 1977−1980—rather than a true free-market price.

As part of what Friedman called the plan's preoccupation with "paying for energy through taxes" rather than market prices (*Newsweek*, May 2, 1977*a*, p. 20), there were also further proposed categories of oil. In giving an analysis of the plan his forecasting agency had produced, Otto Eckstein noted the complexity of the classification schemes: "The new energy program establishes six classes of oil, each with its own price control schedule: old old oil, old new oil, stripper well oil, new new oil, Alaskan oil, and foreign oil." [399] The situation was further complicated by the various names that administration officials gave when referring to "new new oil"—that is, the oil discovered in the United States from April 1977 onward that would have its price linked to the 1977 world price. In a single congressional hearing, Secretary of the Treasury Blumenthal variously called this category "truly new oil," "newly discovered domestic oil," and "the third tier."[400] Among other administration officials, William Nordhaus of the CEA opted for the term "'brand new' oil," while Schlesinger referred to the same concept as "frontier oil."[401]

Beyond the confusion over the names for different categories, there were concerns about a reliable means of distinguishing among oil types. Eckstein expressed doubt about there being "a practical means to identify and classify every barrel of oil and to track it through the productive and distributive process" and suggested that inaccuracies would emerge.[402] Another critic of the program observed (Sweeney, 1977, p. 188) that "the Carter Administration seems to be having great difficulty defining new-new oil… Even if a satisfactory definition can be found, enforcing compliance is extremely difficult." In the wake of the plan's proliferation of categories, Friedman noted caustically that it seemed to reflect a position that "if a little bureaucracy creates problems, more bureaucracy will solve them!" (*Newsweek*, May 2, 1977*a*, p. 20.)

The administration's basis for regarding itself as relying more on the price system—despite its

[401] See Nordhaus' testimony of June 29, 1977, in Committee on the Budget, U.S. House of Representatives (1977n, p. 3) and Schlesinger's testimony of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977a, p. 4).
[402] From Eckstein's prepared testimony of May 20, 1977, in Joint Economic Committee (1978b, p. 13).

proposal to divide domestic oil product among a still greater number of categories than previously, regarded itself as relying more on the price system—rested on the inclusion in the plan of the COET or wellhead tax. Price control would apply to the prices producers charged, but the COET would then make the *post-tax price* equal across categories and have that price correspond to 1977 world market prices. Provided that the world price remained at its (real) 1977 level, a number of existing anomalies would be eliminated: the oil prices faced by all refiners would be uniform; prices of domestically produced oil (inclusive of COET) would be the same as the price of imported oil; and the price of gasoline in the retail market would tend no longer to be artificially low. The subsidy engendered by price control to the consumption and importation of oil would therefore be eliminated.

This streamlining would remove *some* of the distortions in the U.S. oil market, mainly those present on the demand side, and some of the existing administrative complications associated with price control. But it did *not* correspond to the elimination of price control. That the plan did not amount to decontrol—but, instead, to permanent price control—was, in effect, acknowledged at the official level by William Nordhaus when, in testifying in favor of the administration's energy program, he described it as moving from the previous "haphazard" set of pricing regulations to a more uniform arrangement: "there would be an enormous simplification of the existing price control system."[403]

The administration's assumption that there would be no second oil shock

In describing the COET and its implications for U.S. oil prices, Schlesinger remarked that the "tax is designed to raise the prices facing [every U.S.] refiner to a single uniform price equal, we trust, if world prices do not move significantly, to the world price."[404] The manner in which Schlesinger formulated this description reflected the reality that, in fact, the energy plan did *not* propose to bring the post-tax domestic oil price, unambiguously and automatically, to the world market level. Instead, it would adjust the controlled prices in a manner that lifted the post-tax price for all U.S.-produced oil to the world market price prevailing in 1977, after which the post-tax price would be kept at that level in real terms.[405]

---

[403] From Nordhaus' testimony of June 29, 1977, in Committee on the Budget, U.S. House of Representatives (1977b, p. 3).
[404] From Schlesinger's testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate (1977a, p. 27).
[405] This was embedded in item number 40 in Schlesinger's list of the 113 proposals in the National Energy Plan, submitted as part of his testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate

This part of the administration's proposal was a mirror image of the fact that the design of the COET was predicated on there being no second OPEC shock. Schlesinger himself gave his grounds for believing that there would be no adverse oil shock in the coming years by suggesting that, as non-OPEC sources of oil were arriving "in the short run and up to about late 1979 or early 1980… the ability of the more hawkish members of OPEC to push up prices will be limited."[406]

This position was not out of line with Friedman's position that there would not be a second oil shock. Indeed, Friedman over this period continued his prediction that OPEC would break up or be forced to lower prices by end-decade. "Without our foolish and misdirected energy policies," Friedman remarked after the plan was released, "I believe that the OPEC cartel would by now have collapsed. And it still will[,] despite the best efforts of the U.S. government to prop it up." (*Newsweek*, May 2, 1977*a*, p. 20.) Similarly, during his June 1977 visit to Alaska, Friedman remarked that "the odds are that[,] sometime in the next five years, more or less, the OPEC cartel will break up."[407]

Both Schlesinger (believing that there would not be a second oil price hike in the next few years) and Friedman (believing that the first oil shock would be unwound in 1977–1982) were wrong. The second oil shock occurred in 1979. But, while Friedman was, in a sense, the more wrong of the two, as Schlesinger saw oil prices staying level while Friedman regarded them as likely to fall, Friedman's *policy prescription* was far more robust to the advent of a second oil shock than was Schlesinger's. Friedman's position that domestic price decontrol would eliminate the underpricing of oil in the United States was valid irrespective of what the future held in store for OPEC and its market power. In contrast, Schlesinger specifically predicated the COET proposal and the overall National Energy Plan on there being no further adverse oil shock occurring in coming years.

U.S. legislators were surprised at the lack of contingency for a future oil shock in the administration's 1977 energy proposals. Senator Biden indicated that he would be reluctant to vote for COET without knowing more about the form that energy policy would take if "the

(1977a, p. 8): "40. Provide authority to establish a lid on both producer prices and the wellhead tax if world oil prices increase faster than inflation."

[406] From Schlesinger's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 122).

[407] Friedman (1977e, p. 8).

president decides to 'decouple' COET from keeping pace with world prices."[408] And Senator Teddy Kennedy indicated puzzlement at the administration's apparent willingness to allow such a decoupling, as it would allow domestic prices to become separated from the world market price once again after the administration had gone to the effort of introducing a tax designed to eliminate the existing separation.[409]

The administration's default position was that, if a new rise in the world oil price was large, the administration would *not* follow it by raising COET, and so the domestic post-tax price, commensurately.[410] Secretary of the Treasury Blumenthal actually made a virtue out of this property, testifying that "the [proposed] legislation permits us not to go ahead and keep increasing prices if .... we feel that we could insulate ourselves from whatever they [OPEC] might be doing."[411] Evidently, the notion—which Friedman had rejected repeatedly—that price controls provided a means by which the American economy could be insulated from OPEC oil-price moves was hard to shake out of U.S. public discourse, even when the administration was advocating the adjustment of home oil prices to the past OPEC shock.

Not only would price control in the face of a new oil shock not really insulate the country as a whole—it would, in effect, create new versions of the original price and supply distortions that the COET was designed to address. In particular, once a discrepancy between domestic and world prices reemerged, oil would resume being underpriced, and so overconsumed, in U.S. markets. Furthermore, in such an event, the entitlements system governing U.S. refineries—the system that both reflected and spread the underpricing of oil associated with price controls (see Chapter 6 above) would then need to be revived. Schlesinger had testified that under the plan "we can get rid of the existing entitlements system" that arose from the discrepancy between domestic and world market prices.[412] But both he and Blumenthal acknowledged that, in the event that a second oil shock occurred and COET (and corresponding price control) did not then

[408] See Biden's remarks (of September 1977) in Committee on Energy and Natural Resources, U.S. Senate (1977b, p. 83).
[409] See Kennedy's remarks of May 25, 1977, in Joint Economic Committee (1978b, p. 112). Kennedy—who, during the late 1970s, ran hot and cold on the general idea of deregulation as a national policy (see Boskin, 1987, p. 84)—subsequently seemed to support the administration's position that it would hold prices down if a second oil shock occurred. Kennedy stated the following July that "we must have some price controls if we are to prevent the OPEC cartel from inflicting damage [on]to our economy and to avoid windfall profits from being created by the escalation of international oil prices." (July 15, 1977, remarks, in Committee on the Judiciary 1977, U.S. Senate, 1978, p. 74.)
[410] See Schlesinger's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 120).
[411] From Blumenthal's testimony of May 20, 1977, in Joint Economic Committee (1978b, p. 92).
[412] From Schlesinger's testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate (1977a, p. 27).

move in step with the new world oil price, the entitlements program, after having been discontinued, would need to be brought back in.[413]

The National Energy Plan's lack of preparation for a second oil shock was also evident in its treatment of retail prices. One of the elements of the plan was: "Eliminate gasoline price controls, if feasible, with authority to reimpose controls if prices rise above a predetermined level."[414] As discussed in previous chapters, gasoline price controls, although present in the United States starting in 1971, were not a very heavily enforced aspect of petroleum price controls in the 1970s, and the underpricing of retail petroleum product really resulted from federal controls on *prices of crude oil*. Due to these crude-oil price controls, the gasoline price had far from adequately adjusted by 1977 to the first oil shock, and Friedman noted that the U.S. gasoline price in 1976 was actually 2 percent *lower* in real terms than its value two decades earlier (*Newsweek*, June 13, 1977).

If no second oil shock occurred, and the COET raised the post-tax oil price to the world level, then gasoline prices would very likely cease to be underpriced: Schlesinger estimated they would rise in such a situation by about 5 or 6 cents per gallon.[415] Together with price increases already allowed for in existing price-control legislation, this would, it was estimated, imply a total rise of 8 to 10 cents in retail gasoline prices by 1980 over the mid-1977 level—finally reflecting fully the 1973−1974 oil shock.[416] Formal removal of gasoline price controls would, against this background, be a logical corollary, but not the catalyst, of the gasoline price rise.

But the plan's ambivalence about removing gasoline prices reflected the uncertainty about how energy policy would handle a second oil shock—and, in particular, whether the U.S. policy response in that event would involve allowing (post-tax) prices of domestic oil to increase. As it

---

[413] See Blumenthal's testimony of May 20, 1977, and Schlesinger's testimony of May 25, 1977, on pages 92 and 122, respectively, of Joint Economic Committee (1978b). The existence of this policy intention seemingly shaped a change in the CBO's summary of the plan. From saying, in June 1977, that the COET "would also lead to the elimination of the so-called 'entitlements program,'" Alice Rivlin of the CBO moved three months later to stating that institution of the COET would merely "probably lead" to the phasing-out of the entitlements program. (See, respectively, Rivlin's testimony of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives, 1977a, p. 131, and of September 16, 1977, in Committee on Energy and National Resources, 1977a, p. 4.)

[414] See item 56 in Schlesinger's list of the 113 proposals in the National Energy Plan, submitted as part of his testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate (1977a, p. 9).

[415] See Schlesinger's testimony of May 3, 1977, in Committee on Energy and National Resources, U.S. Senate (1977a, p. 40).

[416] See Alice Rivlin's testimony of June 1, 1977, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1977a, p. 131).

turned out, in the final year of the decade, 1979, the retail price went up much more by seven cents—by 23 cents, from 63 cents to 86 cents per gallon.[417] This was not because of COET (which had not been imposed) or price decontrol (which had not yet started). It was because, contrary to the Carter Administration's 1977 expectation, a second oil shock did occur within a couple of years. As had occurred in the case of the first oil shock, average petroleum and gasoline prices moved up, even in the face of domestic petroleum product being price-controlled—in large part because of the fact that the controls regime existed alongside a substantial, non-price-controlled, imported portion of petroleum consumed in the United States, with this component's behavior having a major bearing on average prices.

By the time of this new shock, the opportunity for the U.S. economy to adjust properly to the first oil shock through the option of prompt decontrol of gasoline and oil prices in 1977 had been lost—in favor of a protracted national debate about the alternatives to petroleum price decontrol that were embedded in the National Energy Plan. The *status quo*, described by Friedman (*Newsweek*, June 13, 1977) as one in which "government policies have been falsifying the true situation to consumers," could have been rapidly altered by instituting immediate price decontrol. But the Carter Administration had instead opted in 1977 to seek a multi-year, tax-based approach to the underpricing of energy.

Production incentives under the energy plan

One of the clearest deviations of the National Energy Plan from decontrol was in its proposed treatment of oil producers' revenues.

Although, under the plan, the price facing U.S. oil purchasers was envisaged as moving into line with world prices, the move higher in domestic prices would not be allowed to show up in increased after-tax revenue to those bringing the oil onto the market: the U.S. producers of oil from existing wells. Instead, the extra revenues associated with the higher purchase prices would go to the federal government, as COET receipts. There lay the most crucial flaw of the National Energy Plan, in Friedman's view: the neglect of "the supply side" of the oil market and its role played here by price.[418]

[418] Friedman (1977e, p. 8).

Raising prices through taxes instead of decontrol would "do nothing to stimulate supply," he remarked. "…This is a one-armed approach, with all the emphasis on [reducing petroleum] consumption and very little, except in words, on production." (*Stanford Daily* (California), April 28, 1977.) In particular, Friedman regarded the plan as not including an incentive to increase domestic oil production. By contrast, price decontrol would provide such an incentive.[419]

The notion that the Carter-Schlesinger plan addressed the problem of high world oil prices by creating incentives to reduce demand but not incentives to boost supply was also stressed by *The Oil and Gas Journal*. "President Offers Only Half an Energy Policy," the newspaper editorialized (April 25, 1977), remarking of Carter that "he offers an energy program that tackles only one side of the problem—demand… without meaningful incentives for development of more supply." In a later editorial, it illustrated the problem by invoking the president's former occupation as a peanut farmer: "Suppose July Carter the farmer were asked to design a scheme to stimulate peanut production. Would he slap a lid on prices [of] all peanuts except those producers in fields plowed for the first time after April 20, 1977…? That makes no more sense for peanuts than it does for petroleum."

By the time Secretary of the Treasury Blumenthal appeared before Congress' Joint Economic Committee on May 20, 1977, to advocate the energy plan, these editorials had appeared, and Friedman had made his similar criticisms in *Newsweek*, while other figures like Ronald Reagan and William Simon had criticized the plan publicly on parallel grounds.[420] Without naming any specific critic, Blumenthal remarked: "Those who say this program does not emphasize production are wrong in my judgment."[421] By way of refutation, Blumenthal provided a table in which the revenue accruing to a U.S. oil company from an incremental increase in oil output compared favorably with the situation facing producers in other countries (Joint Economic Committee, 1978b, pp. 97–98). However, the high margin arising from oil production that Blumenthal cited was for the extremely special case of new-new oil. Producers of this type of oil

[419] See, for example, *Newsweek*, May 2, 1977*a*, and Friedman's follow-up columns over the rest of 1977, as well as his remarks in *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 23 of transcript.
[420] Reagan had remarked (on *Meet the Press*, NBC, May 1, 1977; quoted in Pater, 1978, p. 92): "I have felt for a long time that the government is not the answer to the energy problem. Government *is* the problem… The great problems in the energy field came about with government's involvement in the marketplace, regulation, price-fixing and so forth, and I think that today the answer lies in the marketplace." For William Simon's reaction, see *Washington Star* (Washington, D.C.), May 9, 1977. Simon later elaborated on his criticisms of the Carter energy program in *Wall Street Journal*, June 10, 1977, and in Simon (1978, pp. 91–92).
[421] From Blumenthal's testimony of May 20, 1977, in Joint Economic Committee, 1978b, p. 81):

would indeed be able to keep a very large share of their receipts, and their receipts would reflect the world price (albeit doing so only starting in 1980). The fact was that, in contrast, oil production arising from sources on-stream in 1977 would have the receipts associated with moving domestic oil prices to the world price essentially fully taxed away via the COET.

Blumenthal remarked, accurately enough: "I think frequently when people have criticized us for not enough incentives having been built in for additional production, what they mean is that we should have just decontrolled everything."[422] But, insofar as quantity supplied did depend on prices in the oil market, it *was* the case that a more comprehensive liberalization of the price system, accompanied by more widespread retention of profits by U.S. producers than the National Energy Plan, was required if U.S. oil production was to be stimulated. Friedman stressed the notion that higher prices, accruing to producers, would both lead new wells to spring up—decontrol "would give people an incentive to produce new sources of energy and of crude oil" (*Stanford Daily* (California), April 28, 1977)—and stimulate higher production from existing wells—"the incentive to produce is clearly greater if the seller gets the higher price" (*Newsweek*, May 2, 1977*a*, p. 21).

From this perspective, Schlesinger and the other makers of the energy plan had cornered themselves by offering a system in which only a sliver of domestic oil production—that associated with "new new oil"—would involve producers receiving market prices. Even Schlesinger acknowledged that that part of the market was so small that it was likely "there will be no substantial flow of oil" arising from that market segment.[423] And when Blumenthal was asked by a senator whether it was the case that most of the known unproduced U.S. oil output lay in fields whose output the Carter Administration proposed to keep at previously controlled prices, Blumenthal answered that he did not know.[424] In fact, his questioner (Senator Jacob Javits, R–NY) was correct. Correspondingly, a Congressional Budget Office study noted that the current prospect of increased oil production lay mainly in "increased development of known but costly fields and advanced recovery from older fields."[425]

Notwithstanding this acknowledgment, the CBO study came out in favor of the notion that

[425] Congressional Budget Office (1977, p. 25).

decontrol of prices would not stimulate oil production.[426] In the Carter Administration during 1977—though not after its about-turn in energy policy in 1979—this would be the position taken, too, in defense of both the formulation of the COET and the overall energy plan. For example, in September 1977, FEA Administrator O'Leary would flout the notion of an upward-sloping supply curve by asserting in congressional testimony: "If producers were allowed higher prices for crude that they are already producing from existing wells… the result would be no increased production from those properties."[427] As part of its explanation for its goal of denying (to existing oil producers) sales revenues arising from higher prices, administration officials gave the impression that oil provided to the market by existing fields came from an existing stockpile, rather than out of a production process. For example, Blumenthal described oil output generated from existing oil fields as "oil the producer has in his inventory," and Schlesinger rationalized the COET by stating that the administration sought to preclude "substantial inventory profits on all of the existing inventories."[428]

Friedman was not only affronted by officials' disregard of the notion that oil supply was price-elastic. He was also repelled by the logic of Schlesinger's position (which echoed that of longstanding proponents of oil-price control) that it would be untoward to allow existing producers' revenues to be higher when oil prices were higher. Schlesinger suggested in testimony that giving market-determined marginal revenues to anything other than totally new sources of oil would be "providing inventory profits unrelated to economic contributions."[429] A similar sentiment appeared in the administration's original document concerning the energy program, and, in analyzing that passage of the document, Friedman seized on what he termed its "subversive" character.[430] By the same logic, Friedman suggested, homeowners should have their capital gains taxed away when they sold their houses.[431]

[429] From Schlesinger's written statement for the hearing of May 25, 1977, in Joint Economic Committee (1978b, p. 117).
[430] See *Newsweek*, March 13, 1978, *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978 (p. 19 of transcript), and Friedman (1983d, p. 150). The passage of the plan being criticized was Executive Office of the President (1977, p. 50). Similar passages appeared in Executive Office of the President (1977, pp. XI, 30).
[431] Again, see *Newsweek*, March 13, 1978, *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978 (p. 19 of transcript), and Friedman (1983d, p. 150).

This objection to the philosophical doctrine embedded in the plan related to Friedman's supply-based economic argument against the COET. "Taxing away the fruit of past investment is hardly the way to encourage new investment," he suggested, adding that it was "simply stupid of us" to institute policies that made routine the outright seizure of revenues associated with higher prices (*Newsweek*, June 13, 1977).

Having sales revenues taxed away, replacing market mechanisms with taxes as a means of adjusting prices, and the range of quantitative regulations in the plan all amounted to a move "to socialize energy," Friedman suggested when reflecting at the end of 1977 on the administration's plan (*Newsweek*, December 19, 1977). This judgment paralleled one he had made in Alaska in the previous June, when he had remarked that the various prerogatives given to the government on the production, distribution, and importation of oil meant that "the energy policy that Mr. Carter has proposed is a policy[,] fundamentally[,] of nationalizing the energy industry."[432]

"*War profiteers*" *and economists' views on decontrol*

In the same Alaska remarks, Friedman suggested that, to his knowledge, there was essentially no disagreement among economists that price decontrol would be the best response in current circumstances.[433] This was an exaggeration—even if attention was limited to economists outside the government (and so leaving aside the leading economists in the administration like Schlesinger, Blumenthal, and Nordhaus who were making the case for the National Energy Plan's alternative to decontrol). For example, we have already seen (Chapters 3 and 6) that, before 1977, Paul Samuelson spoke favorably about the system of controls on U.S. oil prices. Samuelson also reacted favorably to the Carter energy plan.[434] However, although Friedman was incorrect in suggesting near-unanimity among economists against oil price decontrol, it was indeed the case that there was a large body of opinion among economists favoring decontrol. This was despite testimony by administration officials suggesting that decontrol advocacy was limited to very few people.[435]

An occasion arose in late 1977 to make the public more aware of the existence of a critical mass of economists in favor of decontrol. The immediate catalyst occurred when President Carter

[432] Friedman (1977e, p. 8).
[433] Friedman (1977e, p. 8).
[434] See, for example, *Newsweek*, May 2, 1977*b*. Samuelson also declared that decontrol had "no chance of acceptance" politically (p. 20). This remark likely partly underlay Friedman's misconception that Samuelson saw decontrol as the best policy but as having to be ruled out (only) because it was not politically acceptable.
[435] See, for example, the quotation from William Nordhaus in the first section of this chapter.

remarked at a news conference on October 13 that "there is potential war profiteering" in the behavior of oil companies and stated: "This could develop, with the passing months, as the biggest ripoff in history."[436] Carter's remarks were followed within a couple of weeks by Friedman and a number of other economists putting their names to a statement by "Economists for Responsible Energy Policy" that was organized by the National Taxpayers' Union and placed as a full-page advertisement in the *Washington Post* (October 27, 1977), the *Wall Street Journal* (November 3, 1977), and some other newspapers. The economists stated: "If the market is allowed to set the price, this will bring forth additional energy supplies which will lead to lower prices in the future." They contrasted this arrangement with the Carter plan, which mostly lacked this production-stimulating aspect.

As with so many committees' statements in which Friedman participated, the finished product read much like a solo-authored Friedman article: Friedman acknowledged that the published version reflected his overhaul of an early draft (*Chicago Daily News*, December 1, 1977).[437] And it covered much the same ground as his *Newsweek* critiques of Carter's energy policy. In particular, the statement maintained: "The so-called 'energy program' would be the largest peacetime tax increase in history." The statement also criticized Carter for retaining the Nixon and Ford policy of energy price controls and suggested that "the President's intemperate language reveals the essential weakness of his case."

It is notable that among Friedman's cosignatories was Robert Lucas.[438] This example establishes that the conclusion made by a study of Lucas' public-policy activities that "Lucas's participation in the public debate was 'unintended': the public always *solicited* Lucas to express his opinion and advice, not the opposite" (Goutsmedt, Guizzo, and Sergi, 2018, p. 1, emphasis in original)—

[436] Carter (1977e).

[437] Friedman's influence on the published statement broadly conformed to his observation, made earlier in the year, with regard to jointly-written public statements: "it's the old story: the person who writes the first draft generally tends to control the direction of the later ones." (Instructional Dynamics Economics Cassette Tape 212. April 1977, Part 2.)

[438] The list of signatories included several economists affiliated with, or visiting, the Hoover Institution at the time, including Friedman, Martin Anderson, Karl Brunner, Allan Meltzer, and Robert Hall (who had recently published an analysis quantifying the distortion to demand and supply produced by the U.S. energy price controls: see Hall and Pindyck, 1977); a number of University of Chicago economists other than Lucas, including George Stigler, Yale Brozen, Gale Johnson, and Sam Peltzman; various academics who had been workshop or dissertation students of Friedman's including William Poole, Richard Selden, Thomas Sowell, and Warren Nutter; and public-choice specialists like Alman Alchian, William Allen, Gordon Tullock, and James Buchanan. The signatories also included the virulently anti-Friedman libertarian Murray Rothbard.

is factually incorrect.[439] The conclusion is directly refuted by the existence of the 1977 open letter that Lucas co-signed with Friedman. Therefore, Lucas did, in fact, offer unsolicited policy advice to the public. As will be seen, during the 1970s, he did so on more than one occasion with Friedman.

In fact, Friedman's public-policy activism was something that Lucas watched closely. It has already been discussed in the previous volume that Lucas' time as a graduate student in the early 1960s left him struck by Friedman's bringing of current public-policy issues within the scrutiny of economic analysis.[440] This left a lasting impression on Lucas, who would remark of Friedman's writings, "I'm sure I've read everything he's ever written."[441] Lucas' career trajectory also predisposed him toward being steeped in the public-policy side of academic macroeconomics. Friedman once described his first full-time academic appointment—at the University of Wisconsin in 1940–1941—as having been complicated by the fact that the university's "business school… was trying to take over the economics department."[442] This description contrasts with the situation that Lucas had in his own first full-time academic job—his position, held for more than a decade, at the Carnegie Institute of Technology (or Carnegie Mellon University, as it was renamed during Lucas' employment). At that institution, no takeover by the business school of the economics department was either necessary or feasible: the university's main economics department has always been located in its business school. Lucas was consequently a member of a business school throughout the period from 1963 to 1974— a situation that tended to bring him into forums discussing current public policy.

Beyond these university forums, Lucas made a major public-policy intervention in late 1971 by co-signing with Friedman, Allan Meltzer, Karl Brunner, and others a public statement opposing the prospect of a resumption of fixed exchange rates, after the previous August's liberalization

---

[439] The study purports to provide an exhaustive account of Lucas' activities in public policy in 1968–1987, based on Lucas' personal papers. However, as is often the case with studies relying heavily on unpublished archival material, this investigation actually neglects altogether items in the *public* record (in this case, the open letters Lucas coauthored with Friedman) and so is not actually exhaustive. This public record also refutes the authors' claim (p. 3) that, with regard to ascertaining Lucas' public-policy activity, "[a]rchives are essential because… it would otherwise be impossible to detect it from other sources." Lucas' activity in public policy discernible from material in print in the 1970s, and to suggest otherwise implies insufficient familiarity with the published record.

[440] See Nelson (2020b, Chapter 11).

[441] In Snowdon, Vane, and Wynarczyk (1994, p. 221). As of June 2019, the sparse bookshelf of Lucas' office at the University of Chicago contained numerous Friedman-authored books, including *Capitalism and Freedom*, the 1975 version of *An Economist's Protest*, and *Tyranny of the Status Quo*. (Robert Lucas, personal communication, June 3, 2019.)

[442] Academy of Achievement interview, January 31, 1991.

moves (*Democrat and Chronicle* (Rochester, New York), December 9, 1971).

Lucas' public-policy-related activities in the 1970s, including several contributions to the series ostentatiously called the Carnegie-Rochester Conference on Public Policy, flowed naturally from this background. So too, did his policy-oriented research paper "Rules, Discretion, and the Role of the Economic Advisor," prepared for an October 1978 NBER conference, in which Lucas discussed the Laffer curve and tax-based incomes policy, as well as the budget-limitation movement, discussed in Section II above, in which Friedman was involved.[443]

Consumption incentives, relative prices, and the proposed rebate

The 1977 open letter on energy that Friedman, Lucas, and others co-signed also had criticism of the treatment of the demand side of the market proposed in the Carter plan. The specific criticism offered centered on the fact that, although the plan did propose to bring the petroleum prices facing U.S. purchases to current world levels, this was to be accomplished by taxes rather than decontrol. This, the letter contended, made it likely that, if the oil price came down in the future (as Friedman believed it would, even if conditions for higher U.S. supply were not improved), "the cost to the consumer" would not fall, as the COET would not be lowered appropriately (*Washington Post*, October 27, 1977). That this concern had some substance was later brought out by experience in Australia. When world oil prices did decline by a large amount in 1985−1986, the Australian government allowed only about a quarter of the decline to be felt in domestic gasoline prices, with the rest of the decline offset by an increase in excise tax (*The Age* (Melbourne), February 25, 1986).

For the immediate future, however, 1977's National Energy Plan would seek to align the prices facing consumers better with the world price. James Schlesinger had stressed the economic basis for this move when he testified that, under the plan, conditions would emerge in which "consumers recognize the true replacement cost of oil and respond by conserving."[444] For his part, Friedman had acknowledged merit in this aspect of the plan when he noted that the administration's plan "goes partway in the right direction by letting some prices rise" (*Newsweek*, May 2, 1977*a*, p. 20). Although he disliked this being accomplished via new taxes,

---

[443] See Lucas 1980, pp. 204−205). An early discussion of Lucas' later (early-1980s) public-policy interventions with regard to national debate in the fiscal area was that of Blinder (1987, pp. 89, 220−221). These interventions are discussed in Chapter 11 below.

[444] From Schlesinger's written submission for his testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 119).

he granted that these “taxes have the desirable objective of restricting consumption” of energy (*Stanford Daily* (California), April 28, 1977) and that the price signal was the same to consumers whether effected through taxes or decontrol (*Newsweek*, May 2, 1977*a*, pp. 20–21). Friedman summarized matters in June 1977 by noting that, insofar as the plan was aimed at “discouraging consumption” of energy through higher prices, this was “all to the good.”[445]

That higher domestic energy prices should be accompanied by tax rebates to U.S. households was something the Carter plan had in common with the Ford Administration’s unsuccessful proposals to decontrol oil prices in 1975. But it was a proposal to which Friedman was unsympathetic, and he opposed the plan’s rebate component (*Newsweek*, June 13, 1977). An objection to the rebates that he raised one occasion may seem jarring: “I have no incentive to conserve is what I spend with the left hand is going to be given back to me with the right.”[446] This objection was commonly made in congressional hearings but, in defending the COET, the Congressional Budget Office’s Alice Rivlin had a straightforward answer: “it isn’t likely that [the consumer] will spend all of his rebate on petroleum products ... [W]hat influences the relative amount of petroleum products ...that he purchases ... is presumably the price of petroleum relative to other things.”[447] In other words, the objection articulated by Friedman described what households *could* do with the rebate, not what they likely *would* do.

One economist’s retrospective on the rebate proposal, in noting that the objection just described was a widespread reaction to the proposed rebate, suggested that it reflected a “fundamental misunderstanding” of the influence of price changes on incentives.[448] Indeed, there remains considerable belief among economists in what Knittel (2014, p. 116) calls the “merits of taxing a

---

[445] Friedman (1977e, p. 8). There remained some prominent figures who—in contrast to the position taken by Friedman, Paul Samuelson, and the Carter Administration—believed that energy should remain underpriced in the United States. In this connection, Senator Henry M Jackson claimed that energy demand was price-inelastic—in a May 1, 1977 appearance on CBS’ news discussion program *Face the Nation* on May 1, 1977, he declared “Tax will not deter consumption” (see Pater, 1978, p. 87)—while economics columnist Eliot Janeway suggested that raising energy prices at home would have the effect of ratifying the oil shock: “President Carter’s crazy-quilt energy proposal, aimed at cutting fuel consumption by raising the cost, has legitimized the OPEC stickup.” Friedman, of course, did not disagree that Carter’s energy plan was a patchwork and that, in its totality, it was liable to work to bolster OPEC. But the recognition of the need for the prices facing consumers to rise to world levels was an aspect of the plan that he was positive about.

[446] *Milton Friedman Speaks*, Episode 9, “The Energy Crisis: A Humane Solution,” taped February 9, 1978, p. 25 of transcript.

[447] From Rivlin’s testimony of September 16, 1977, in Committee on Energy and National Resources, U.S. Senate (1977a, p. 16).

[448] See *New York Times*, February 16, 2006. This article claimed that the rebate program in question was offered in conjunction with a gasoline-tax proposal Carter advanced in 1979. Most likely, however, the article’s author meant instead to refer to the 1977–1978 proposal of the COET and an accompanying rebate.

product to change marginal incentives while returning the revenues from the tax to consumers." Friedman was certainly aware of the price responsiveness of energy demand. Was his opposition to a rebate/energy-taxes combination therefore an instance of what Paul Samuelson (in Silk, 1976, p. 52) characterized as Friedman's willingness to tailor his responses in his popular discussions in a non-scientific manner—so that, in certain cases, Samuelson alleged, Friedman "gives you a hokum answer," rather than one based on economic analysis?

The answer is a qualified no. Friedman's objection to the rebate quoted above should be taken alongside other points he made concerning the price and income repercussions of oil-price increases. Friedman did have grounds in his own economic framework for believing that accompanying the lifting of consumer petroleum prices with a community-wide tax rebate was economically unjustified. His opposition to the rebate should be understood in that light.

To advocates of the Carter plan, a price-rise-for-rebate swap made sense because, absent the rebate, a major rise in gasoline prices would raise the overall price level and lower real aggregate demand. For example, Secretary Blumenthal asserted that there was "no reason to assume that other prices will fall just because petroleum prices rise," and, along the same lines, Alice Rivlin suggested that "the rebate will preserve [consumers'] real purchasing power." To Friedman, however, a gasoline price rise *per se* would *not* permanently raise the consumer price level. Monetary policy would largely set the level of nominal spending and, subject to the lid on nominal spending placed by monetary policy, a gasoline price rise would eventually work itself out as solely a relative-price change.[449] From that perspective, the rebate was unnecessary as a demand-preserving measure, and its proponents underestimated the role monetary policy played in determining both spending and inflation.

Indeed, as previous chapters have discussed, Friedman had a dim view in general of tax rebates as a policy measure. This was so despite the fact that his name is associated with two measures that are widely associated with the notion of checks being paid out to the population: "helicopter money" and the negative income tax. However, once Friedman's analyses of each of these two items are considered carefully, the reason for his opposition to general rebates becomes clearer.

Helicopter money has become in recent decades part of a monetary policy prescription or as a

[449] In particular, it would do so holding constant the response of potential output. Friedman did believe that the oil shock had raised the price level by lowering potential output—but that this lowering had already occurred by 1977. See Chapter 3 above.

means of describing how to provide monetary stimulus to the economy under certain conditions (see, especially, Bernanke, 2002b). Friedman's own analysis did not, however, use helicopter money in this way. His paper "The Optimum Quantity of Money" in 1969 invoked the helicopter-money thought experiment.[450] But Friedman did not advance helicopter money as a policy prescription. Rather, he used that concept—money injections associated with uniform increases in money balances across the community—to consider a monetary action in isolation, without the need to consider effects on the commercial banking system or on the distribution of money holdings across individuals.[451]

And when something akin to helicopter money was presented as a practical prescription for fiscal policy, Friedman opposed it. In a foreshadowing of his reaction to the 1977 plan, in early 1975 he objected to the idea of issuing tax rebates as energy prices rose and referred to it derisively as a case in which the government would "rain checks" on the population (*Newsweek*, January 27, 1975, p. 25). One of his criticisms was that rebates would disconnect income tax paid from work hours. As Friedman described his view when momentum for rebates as an anti-recession move grew: "I oppose the tax rebates because they are like dropping money from a helicopter and are no reward" for hours worked (*Journal of Commerce* (New York), March 4, 1975, p. 5).[452]

For similar reasons, Friedman drew a sharp distinction between his negative-income-tax proposal and a rebate issued to the whole population. He particularly disliked the idea of rebating the proceeds of a specific energy tax, as in the Carter plan. That only encouraged the idea that the

---

[450] See Friedman (1969a, pp. 4–5, 9, 11–13, 15–16). Various sources have been suggested as possible inspirations for Friedman's helicopter-money scenario. James Lothian (at an American Economic Association session on January 8, 2011) speculated that Friedman may have developed his helicopter imagery on the basis of reading Irving Fisher's (1912, p. 243; 1920, p. 45) image of Santa Claus doubling individuals' average amount of money holdings. Other antecedents to the helicopter imagery have been offered by Hendry's (1985, p. 81), who pointed to Alfred Marshall's (1926, p. 45) discussion (in 1897 parliamentary testimony) of what might happen if the U.K. government distributed new pound notes *en masse* by mail, and by Clayton, Gilbert, and Sedgwick (1971, p. 6) and Gilbert (1982, p. 52), who noted that David Hume (1752b, p. 307) contemplated a scenario in which overnight "every man in Great Britain should have five pounds slipped into his pocket."

[451] Relatedly, at around the time Friedman (1969a) was being finalized, Friedman noted that one might be able to abstract from an "initial effect on the credit market" in monetary analysis if one considered "a monetary system in which the quantity of money was being increased or decreased, let us say, by government passing out handouts or imposing taxes on people and taking back the money." (Instructional Dynamics Economics Cassette Tape 10, January 1969.) See also Friedman and Schwartz (1982, pp. 483–485) and Friedman (1992a, p. 32).

[452] He voiced the same criticism of the Carter Administration's early plan, discussed in the previous chapter, to issue $50 tax rebates as an economic-stimulus measure (Instructional Dynamics Economics Cassette Tape 206, January 1977, Part 1). And, notably, Friedman also voiced sympathy with the derision that this plan was receiving as being tantamount to having checks thrown onto the population from planes (Instructional Dynamics Economics Cassette Tape 209, March 1977, Part 1 and 210, March 1977, Part 2) and himself characterized it as "a proposal to send out a rain of $50 checks to all and sundry" (Friedman, 1978b, p. 8).

rebate was being issued as specific compensation for higher energy costs and that it should be spent on energy products. Friedman reaffirmed that, instead of rebating a specific tax's proceeds, the government should instead target support to low-income individuals by bringing the negative income tax into the U.S. tax system (*Newsweek*, June 13, 1977).

Scrutinizing Schlesinger

As for the question Friedman had posed when the National Energy Plan was first announced—Why had Schlesinger advanced it instead of embracing price decontrol?—Friedman sought the answer, as he now seemed to do on so many matters, in public-choice theory.

Friedman believed that Schlesinger was reluctant to lose another major government post. Yet, as Friedman saw it, energy price deregulation would have this effect, as it would decentralize decisions concerning the distribution of energy. "To propose the right answer—eliminating government controls and letting the free market work—would render unnecessary the agency that he is destined to head!" (*Newsweek*, May 2, 1977, p. 21.)

Friedman later pursued this theme using a well-tried technique in analyzing policymakers who were former academics: contrast their current position on an issues with that expressed in their writings as a researcher.[453] Friedman was taken with an article titled "Systems Analysis and the Political Process" had published in the University of Chicago's *Journal of Law and Economics*—an article Schlesinger had written, Friedman remarked, "when he was still simply an economist."[454] Schlesinger's article had been in the field of public choice, and Friedman, repeating his criticism of the emphasis on taxes in the energy program, suggested that Schlesinger had anticipated his own career path when he had written in the 1968 article that politics was designed "to extract resources from the general taxpayer with minimum offense and to distribute the proceeds among innumerable claimants in such a way as to maximize support at the polls."[455] Schlesinger's immersion in the political world, Friedman suggested, had made him less well disposed to the market solution that he would likely have embraced as an academic economist.

---

[453] This technique mirrored, for example, the approach Warren Nutter had taken in his critique of Henry Kissinger's approach to foreign policy (see Nutter, 1975).
[454] *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 9, 1978, p. 25 of transcript.
[455] See Schlesinger (1968, p. 285). Friedman's column also quoted other portions of the 1968 paper. Later, Kemp's (1979, p. 141) critique of the Carter Administration's energy policy also seized on quotations from Schlesinger (1968).

Friedman's own reliance on the theory of public choice may, however, have led him to an overly cynical interpretation, as it did with his analysis of stabilization policy. Schlesinger's academic background also included, as we have seen, strong advocacy of cost-push views of price-setting. Even before entering public service, therefore, he was more inclined than Friedman was to see a role for the state in overriding the pricing decisions of the private sector.

Legislative developments in 1978

Friedman granted, of course, that allowing the domestic oil price to be market-determined meant, under conditions prevailing in 1977, that it would be permitted to move to the price set globally by a monopolistic group, namely, OPEC (*Newsweek*, June 13, 1977). But he also believed that—contrary to what was suggested by the more hardline cost-push or administered-price perspectives on price-setting decisions—the price mechanism operated powerfully on consumers and producers alike, even when monopoly conditions prevailed on the supply side. A monopolist was sensitive to demand and supply conditions, and price signals might ultimately give rise to extra supplies that undermined the monopoly position. Friedman contended that both the strength of OPEC as of the late 1970s and the severity of the United States' energy problems since the 1973−1974 oil shock resulted from the fact that, as he put it in his February 1978 talk on the energy crisis, the price system had not been allowed to operate in the energy market in the United States.[456] If the U.S. energy market were allowed to work freely and all prices in the market decontrolled, Friedman had told an audience a few days earlier, "you will find the so-called energy problem will disappear faster than you can say 'James Schlesinger.'"[457]

By the time Friedman made these remarks, a distinct change had occurred in the fortunes of the Carter Administration's National Energy Plan. The plan had been passed with very little alteration by the U.S. House of Representatives on August 5, 1977.[458] In particular, the COET had "sailed through the House without serious challenge," the *Washington Post* observed (September 16, 1977, p. 3 of reprint). The House's passage of the administration's energy plan had come on the heels of President Carter signing into law the legislation Congress had passed

---

[456] See *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978 (p. 4 of transcript) and Friedman (1983d, p. 143).
[457] *Milton Friedman Speaks*, Episode 7, "Is Tax Reform Possible?," taped February 6, 1978, p. 23 of transcript. Friedman was here offering a variation on the longstanding saying—which has been much less prevalent in the twenty-first century than it was in the twentieth—that something that happened very rapidly could be said to have occurred before (or more quickly than) "you can say 'Jack Robinson.'"
[458] See, for example, *San Antonio Express* (Texas), August 22, 1977, and the statement of William H. Dempsey in Committee on Finance, U.S. Senate (1977b, p. 1222).

creating the Department of Energy.[459] Schlesinger was therefore understandably buoyed when, in an appearance before the Senate's finance committee on August 8, he observed that essentially all of the 113 proposals embedded in the National Energy Plan had been passed by the House of Representatives.[460] A couple of weeks later, Schlesinger, newly installed as Secretary of Energy, predicted that the Senate would pass the plan by the end of the year (*San Antonio Express* (Texas), August 22, 1977).

Friedman therefore seemed to be poised to be on the losing side of the debate on the plan when he remarked on Boston radio around this time: "The Carter energy program is a monstrosity—a potentially devastating blow to the economy—and a tremendous new invasion by government bureaucracy in the marketplace." (*Boston Herald American*, August 26, 1977.)

Within weeks, however, the climate was changing. Resistance in the Senate to the COET proposal hardened, reflecting the opposition on multiple fronts: advocates of continuing low consumer prices for energy, supporters of decontrol, and those who felt that oil producers should be allowed to receive proceeds from the COET if, as a *quid pro quo*, they stepped up their investment spending (*Washington Post*, September 16, 1977). By mid-October, Friedman, who was enjoying the spectacle of Schlesinger "trying to sell a disastrous so-called energy program" (*Newsweek*, October 17, 1977), was predicting that the National Energy Plan would not secure passage through Congress.[461] And in late November, the National Taxpayers' Union, having paid for the publication of the "Economists for Responsible Energy Policy" letter by Friedman and others, indicated that it was unlikely to organize further letters, as it, too, had concluded that the legislative prospects for the Carter energy proposals were poor (*Chicago Daily News*, December 1, 1977).

At the end of August 1978, after over a year in office as energy secretary, Schlesinger was still advocating the plan, but he now seemed resigned to the fact that Congress would not approve the COET (*The MacNeil/Lehrer Report*, PBS, August 31, 1978). COET, indeed, never became law. When President Carter signed a series of energy bills into law the following November, he put a good face on what had been passed, suggesting that it reflected the "principles" embedded in his original energy plan (see Carter, 1978b). He made a more candid assessment the following May, by which time fuel-supply problems had again become acute at service stations in the United

[459] This occurred on August 4, 1977 (Carruth, 1993, p. 730).
[460] See his testimony of August 8, 1977, in Committee on Finance, U.S. Senate (1977a, p. 7).
[461] *Milton Friedman Speaks*, Episode 2, "Myths That Conceal Reality," taped October 13, 1977, p. 31 of transcript.

States: "I sent up proposals in 1977 as part of the National Energy Plan to increase production, reduce consumption and cut back on our reliance on imported oil—COET, independent users' tax, etc.—[and] none of these proposals were passed into law."[462]

Economics versus engineering and the prospect of decontrol

About six weeks after the National Energy Plan was unveiled, Friedman had remarked of the president: "His energy program, as I mentioned earlier, is not a program which is designed to give the market greater play. [Instead,] it's a program for running things through government. He is, fundamentally, as so many people have pointed out, an engineer. That's his background, that's his training, that's his disposition."[463]

Indeed, notwithstanding the heavy input that an economist (namely, James Schlesinger) had had into the formulation of the energy plan, Friedman judged that it highlighted "what you might call the difference between the economic way of thinking and the engineering way of thinking," as the plan confirmed the continuing prevalence in U.S. energy policy of an engineering-oriented mindset.[464] The engineering mindset, as he saw it, treated scarcity of resources as a justification for government planning of the country's energy arrangements—whereas economic thinking instead saw the price system as conducive to handling a situation of scarcity.

The engineering aspect of the plan was evident in Schlesinger's frequent citation of projections of declines in world oil production. For example, Schlesinger stated in May 1977 that world oil production, at that point amounting to about 60 million barrels per day, "will probably never exceed 75 to 80 million barrels a day."[465] This prediction was not contradicted by the data for

[462] Carter (1979a, p. 184).
[463] *The Open Mind*, PBS, May 31, 1977, p. 14 of transcript.
[464] See *Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978 (p. 4 of transcript), and Friedman (1983d, p. 143).
[465] From Schlesinger's testimony of May 25, 1977, in Joint Economic Committee (1978b, p. 115). Similarly, about fifteen months later, Schlesinger reaffirmed that, "inevitably, we are going to lose the capacity, worldwide, to increase the production of oil… In the future, we will be able to increase production by only one or two percent a year… [O]ur projection of oil supply by 1985 is now smaller than it was a year ago." (*MacNeil/Lehrer News Hour*, PBS, August 31, 1978.) The year 1985—which the Carter Administration and other government sources tended to invoke as a crunch year for U.S. energy supply if the country's energy arrangements did not become more centrally organized (see, for example, Eizenstat, 2018, pp. 146–147)—was a date for which Friedman offered his own half-jocular forecast. In February 1978, upon noting that many observers were predicting an oil emergency in 1985, Friedman suggested that 1985 would feature an oil glut. (*Milton Friedman Speaks*, Episode 9, "The Energy Crisis: A Humane Solution," taped February 10, 1978, p. 15 of transcript.) This particular Friedman prediction concerning the fortunes of the world oil market was one that would be borne out.

many years.[466] But technological advances and oil discoveries eventually led it to be sharply refuted. Indeed, during 2019, world oil production actually exceeded the 100 million barrels-per-day mark.[467] Another widespread prediction in this period was that the United States' oil production and its contribution to global oil production was bound to continue to decline. At the official level, Schlesinger stated: "We face the fact that domestically we are running out."[468] Correspondingly, a Stanford Research Institute study produced in March 1977 saw a future in which "the United States becomes a much less significant factor in world supplies" (Henry, 1977, p. 56) and projected the U.S. contribution to world petroleum output would fall from 23.7 percent in 1970 to 10.9 percent in 2000 (p. 68). In the event, in 2019 the U.S. share of world oil production was back up to 20 percent.[469]

Although he ventured to state that the energy crisis had, at heart, "nothing to do with the world running out of oil," Friedman did not offer a detailed challenge to these projections.[470] Nor did he object to such projections being made. He did, however, stress their fragility—and that the allocation of energy in the United States should not be guided by such predictions, but instead by a decentralized and freely operating price system. The latter system, he emphasized, was resilient to long-range predictions regarding energy supplies being incorrect or subject to major revisions, whereas energy policies based on centralized plans lacked this robustness property.[471]

Friedman indicated in early 1978 that, notwithstanding what he saw as the clear merits of a market-based solution to the energy problem, he was "very pessimistic" about there being

"ultimate effective decontrol" of U.S. petroleum prices.[472] Developments over the remainder of 1978 provided little basis for believing that this pessimism was unfounded. True, the non-passage of much of the Carter-Schlesinger plan had prevented oil price control from officially being made permanent. But the flipside of this development was the preservation of the *status quo*: existing price controls on U.S. oil product remained in place. Five years after the 1973–1974 oil shock, the United States still had energy arrangements that priced domestic oil below world levels. And it was against this backdrop that, at the dawn of 1979, a new oil shock was materializing.

Milton Friedman and Economic Debate in the United States, 1973–2006
Chapter 10: The Tidal Year—1979

Edward Nelson[1]
Federal Reserve Board
July 30, 2023

I. EVENTS AND ACTIVITIES IN 1979

Milton Friedman surely distinctly remembered retiring. In September 1979, it was approaching three years since he and Rose Friedman had left the city of Chicago for northern California. At the time of that move, he had certainly viewed it as amounting to retirement. To be sure, Friedman envisioned continuing some writing and speaking activities in his new location at the Hoover Institution, and, consistent with this, Gloria Valentine herself had relocated to the Bay Area at the same time as the Friedmans' move, in order to continue as Friedman's secretary. But as Valentine recalled: "He did say he was retired when he first came to Hoover."[2] In line with this sensibility, during a talk in February 1977—about six weeks after his move to California, and several months before his University of Chicago affiliation formally shifted to emeritus status—Friedman had described himself as being "on the verge of retirement."[3]

That Friedman initially had this attitude likely reflected the perspective he took toward the momentous decision to leave the University of Chicago. In formal terms, he was simply assuming, starting in the fall semester of 1977, a new full-time job that itself entailed a fresh academic affiliation. But the indications are that Friedman saw this switch as portending a material step-down in his own level of public activity. Fifteen years earlier, Friedrich Hayek, too, had acquired a new university position on departing from the University of Chicago—and this fact would not prevent Friedman from characterizing Hayek as having "essentially retired" upon leaving the University of Chicago.[4] Friedman evidently envisioned his own move to California along the same lines. So, with teaching now behind him, Friedman in 1977 clearly

regarded himself as in the process of transitioning to what in a few years would be a *bona fide* retirement.

But instead, nearly three years later, and with the end of the decade a few months away, here was Friedman, immersed in activities that hardly corresponded to those associated with retirement. On this September 1979 occasion, he was before five television cameras and confronted by a panel of interlocutors.[5] One of these panelists—former London *Times* economics editor Peter Jay—opened his remarks by observing: "I'm a great admirer of Professor Friedman: I've studied him, I've listened to him, I've debated with him; and always before, I've found him at least clear, even when he's been wrong. Today, I found him grossly confused."[6] A heated exchange, taking place before a small audience and the video cameras, ensued. And this debate was being conducted at the institution that Friedman had formally left: the University of Chicago.[7]

The occasion was the taping of one of the debate portions for the U.S. version of the program *Free To Choose*. The on-screen title of this series was *Free To Choose—A Personal Statement By Milton Friedman*. Friedman's early years of nominal retirement had seen him become the star of his own television show.

Although the broadcast of the program would not occur until 1980, the episodes proper (both the Friedman-hosted documentary segments and the debates that followed them in the U.S. version of the series) were made in 1979. Likewise, the book that Milton and Rose Friedman wrote to tie in with the series was completed in 1979.

The "turning of the tide" during 1979

The Friedmans titled the final chapter of their book "The Tide Is Turning." This was a reference to the momentum that was building in public discourse, in the United States and elsewhere, in favor of free-market economics, along with the parallel convergence toward the Friedman position on the problem of how to cure inflation—a problem that was itself the subject of a chapter in the book.

---

[5] On the five-camera setup for the taping of these exchanges, see *Chicago Sun-Times*, July 9, 1980.
[6] *Free To Choose*, PBS, Episode 5, "Created Equal," February 15, 1980, studio debate portion, p. 6 of transcript.
[7] Specifically, the taping occurred in the business school's Harper Library. See *Chicago Sun-Times*, July 9, 1980, and Friedman and Friedman (1998, pp. 492, 499). See also the next chapter.

Friedman had thought he perceived the trends of mainstream thought in the United States moving strongly his way at previous points in postwar history, both with regard to public opinion—most notably at the time of the writing of *Capitalism and Freedom*—and with regard to policymaking—most particularly during the first two years of the Nixon Administration. These previous occasions had been followed by snap-backs and by a renewed embrace of the economic approaches that he had critiqued. But the change in opinion in 1979 that the Friedmans were highlighting proved to be far less ephemeral than the earlier shifts. The year 1979 did indeed prove to be a tidal year regarding Friedman's wider influence. As well as being, as discussed below, a time in which the material change in opinion Friedman had generated in macroeconomic consensus became consolidated, 1979 saw major steps on the national and international stage that increased the influence of his views on economic policy. The key events were the election of the Thatcher Government in the United Kingdom in May, and, at home, the introduction during the year of strategic and tactical changes to U.S. monetary policy in directions Friedman had advocated, and Ronald Reagan once again becoming, in November 1979, an official aspirant for the U.S. presidency. Together, these developments set the stage for the situation of the early 1980s—a period when Friedman's economics was especially influential on policy formulation—as well as for the era beyond that, in which he continued to leave a major imprint on many nations' economic strategies.

It was also the case that 1979 was a tidal year for Friedman outside the area of actual policymaking. His own professional activity shifted sharply and in a manner that would permanently increase his public profile.

Not a research year

Although the influence that he had established up to 1979 in large part reflected his research output, Friedman's own shift in activity during that year did not reflect new production on the research front. On the contrary, more than any previous year, 1979 was marked by Friedman's putting distance between himself and the research world.

One of the signs of this was the near-total lack of participation on Friedman's part during the year in macroeconomic research conferences. Certainly, even in the 1960s, there were important

conferences at which Friedman's work was heavily discussed but that he did not himself attend.[8] He was, nevertheless, highly prevalent on the conference circuit in that decade. By 1979, however, Friedman's attendance of conferences concerned with his own research area had become rare. For example, in the third week of January 1979, the American Bankers Association (ABA) held a mass-attendee "Conference on Reserve Requirements and the Role of the Federal Reserve System."[9] The lunch speaker at the conference was Governor Charles Partee, who, being a Federal Reserve Board member and both a maker and key spokesperson regarding current monetary policy, was the sort of figure whom Friedman had been pitted against at multiple events in the 1960s. But Friedman was not at the ABA conference—an absence made more poignant by the fact that those who did attend included, from the succeeding generation of monetarists, Jerry Jordan, and from the generation of monetarists preceding Friedman, Clark Warburton. This proved to be one of Warburton's very last participations in monetary discussions before his death in September 1979.[10]

The month of September 1979 also saw a symposium on current monetary policy issues held at New York University's Salomon Brothers Center for the Study of Financial Institutions. Again, Federal Reserve policymaker Charles Partee was a key speaker at this event. Back in 1968, Friedman had been a major speaker at a Salomon Brothers forum at New York University on monetary and fiscal policy. But he was absent from the September 1979 event—at which Partee's monetarist sparring partner was, instead, Allan Meltzer.[11]

Virtually Friedman's only participation in a monetary policy conference during the year—and then not as a paper presenter or as a contributor in any other way to the resulting printed

---

[8] Examples included the American Bankers Association conference in September 1965 on monetary policy, the 1966 UCLA conference on monetary indicators, and the Federal Reserve Bank of Boston's first conference (in 1969) on controlling monetary aggregates.

[9] The conference was held on January 18–19, 1979. See American Bankers Association (1979).

[10] Warburton died on September 18, 1979, at age 83, having been hospitalized upon having a heart attack on August 25 (*Washington Star* (Washington, D.C.), September 21, 1979). Prior to this, two papers paying tribute to his career had recently been written, and both were published in the year of Warburton's death: Bordo and Schwartz (1979) and Cargill (1979). Cargill presented his paper at a Federal Reserve Bank of San Francisco seminar in early 1977, with Friedman as his discussant. Cargill observed: "Milton Friedman had great respect for Clark Warburton… And I think Friedman was a deep thinker, and he saw, you know, all of this as part of a continuum in terms of trying to understand how monetary policy works." With regard to discussions in which he had himself engaged with Warburton, Cargill remarked: "I think Clark Warburton was disappointed, [as] I think he felt that history had left him behind. [But] he never once to me said anything negative about Friedman, Schwartz, or the work they were doing. Nothing other than, 'Well, you know, I kind of did the same [thing],' or 'I said the same things twenty years [earlier].' That's it… No evidence of animosity or sour grapes." (Thomas Cargill, interview, April 17, 2015.)

[11] The event took place on September 27, 1979. See Hamburger (1980).

volume—was at a Federal Reserve Bank of San Francisco proceeding in October 1979.[12] His attendance of this conference sent a signal—for which the subsequent quarter-century would offer only a handful of exceptions—that he was henceforth only willing to attend a U.S. monetary policy conference if it was held practically next door to his home or office. The convenience of proximity also was evident in Friedman's participation at a conference, held on December 13−14, 1979, concerned with matters entirely outside the monetary sphere. This was an event at the Hoover Institution devoted to the subjects of conscription and of proposals to restore registration for the military draft in the United States. Friedman not only attended this workshop—which was more public-policy than research-oriented in content and, despite heavyweight participants like himself and Albert Rees, was not limited to economics)—he was also a speaker on the program. Thanks to this and his other interventions during the event, he featured heavily in a weighty (424 pages) record of the conference that appeared in 1982.[13]

During 1979, Friedman did give a research talk in the United Kingdom on monetary matters. The occasion was on April 9, when, at the Royal Society in London, he discussed historical interrelations between the U.S. and U.K. economies.[14] But even this talk—the first annual Harry Johnson Memorial Lecture—occurred during a trip to the United Kingdom whose itinerary reflected Friedman's change in focus. The Johnson Memorial Lecture was a rare academic engagement in a multi-week visit to London spent primarily on other pursuits—with Friedman continuing to work intensively on the *Free To Choose* series, while also finding time to give a talk to a financial institution and to have meetings with U.K. politicians.

By the late 1970s, he had abandoned efforts to keep a presence in the U.K. conference scene. Friedman had not, even in his research heyday, ever tried to emulate the Harry Johnson practice of being a fixture of U.K. and U.S. academic conferences alike.[15] But he had once made some effort to maintain a profile in dialogues that were specifically among U.K. researchers and were about research rather than current policy. Reflecting this practice, he had, in 1968, attended a U.K. conference that formed the basis for an early issue in an early issue of the *Journal of Money, Credit and Banking*. And later, during his September 1970 U.K. visit, he participated in

---

[12] The acknowledgments of Paul Evans' paper (1980, p. 94) thanked Friedman for feedback—apparently relayed at this October 1979 conference. See also Friedman's (1984a, p. 58) citation of the associated published conference volume.
[13] See Martin Anderson (1982).
[14] See Friedman (1980b, p. 511).
[15] Through this practice, as Peter Sinclair put it, Johnson "was the David Frost" of economics, with each regularly hosting "shows on both sides of the Atlantic" in the early 1970s in their respective spheres of economic-research conferences and television (Peter Sinclair, interview, November 13, 2014).

both a Sheffield University conference on monetary economics and the Econometric Society meetings that were being held at Cambridge University. In contrast, from May to September 1979, the United Kingdom was the venue of a string of conferences covering topics and literatures in which Friedman's name featured heavily: a conference on May 9–10 at the City University (London) on monetary targets; a Conference on Practical Monetarism organized by the Money Study Group and held at Oxford University (September 26–28, 1979); and a Social Science Research Conference on Rational Expectations in Brighton (also held in September 1979).[16] Friedman did not attend any of these events.[17]

The year 1979 was also not one that could be judged to have seen major activity in terms of the appearance of new Friedman publications. During the year, he continued to produce a stream of *Newsweek* columns as well as various op-eds in other outlets, mainly in the *San Francisco Chronicle*. But 1979 saw no new article on his part in any research journals: there would be no item by him of this kind that could be cited in future years as "Friedman (1979)."[18] His failure to publish a journal article in 1979 made 1978–1979 the first back-to-back years of no Friedman research journal publications since 1933–1934, the period before he began publishing. And on the rare prior occasions when he had not published a research journal article in any individual year, he had published an article in a public-policy journal or a book chapter during the year. But, other than a debate with Ralph Nader that was put out in a little-seen volume recording a corporate body's conference proceeding, 1979 saw the appearance of no such articles.[19]

---

[16] The dates of the conferences appear, respectively, in the dust jacket text of Griffiths and Wood (1981), in the covering material of Jonson (1979), and in Attfield, Demery, and Duck (1981, p. 349).

[17] Friedman continued to be a regular attendee of the free-market Mont Pelerin conferences held around the world. He was not involved in travel connected with these events during 1979. But Mont Pelerin conferences—which were largely outside the world of economic research—would occasion continued international travel on his part during the 1980s.

[18] A couple of "phantom" citations of an alleged Friedman 1979 research article should be noted. As discussed in Chapter 4, the journal contribution by Judge Milton Friedman (1979) has sometimes been incorrectly included in Friedman bibliographies. And although F.L. Rivera-Batiz and L. Rivera-Batiz (1985, pp. 332–333) cited a Friedman article as published in January 1979, the item in question, although based on remarks given in April 1979, actually saw print in a journal issue dated January 1980 (see Friedman, 1980b).

[19] The item referred to is Proprietary Association (1979).

Friedman's (1968a) article "The Role of Monetary Policy" was reprinted in a 1979 readings collection (Korliras and Thorn, 1979, pp. 91–102), and it was cited in that reprinted form by Thomas Wilson (1984, pp. 26, 39) and by Gavrilenkov (1995)—who actually referenced it as "Friedman, Milton (1979)" (p. 188). This form of citation was not appropriate, however, as the 1979 version was a pure reprint, containing no material not in the 1968 original. By 1979, "The Role of Monetary Policy" had actually been reprinted many times—including in the late 1960s in Joint Economic Committee (1968, pp. 206–215) and in Friedman's (1969c) book *The Optimum Quantity of Money and Other Essays* and in early-1970s readings collections like Smith and Teigen (1970, pp. 476–488), Shapiro (1970, pp. 408–424), and Gibson and Kaufman (1971, pp. 169–179).

Another 1979 reprint of a Friedman work was to be found in an unlikely source. Speaking to a hearing of the House banking committee that he chaired, Representative Henry Reuss complained that the Federal Reserve Bank of

And until the *Free To Choose* book—which would come to be treated as basically a 1980 publication—crept into some U.S. bookstores in the very last days of 1979, the year saw the appearance of no new book of which Friedman was an author.[20] One long-promised book, in particular, did not see release. During his April 1979 Harry Johnson Lecture, Friedman referred to the "study that Anna Schwartz and I have been doing for the National Bureau of Economic Research" and indicated that he would draw results from that study.[21] But, as he implied when he went on to note that this Friedman-Schwartz study was a sequel to books that had appeared in 1963 and 1970, the new volume—*Monetary Trends*—had been under preparation for many years. And there was more work to go. The decade of the 1970s would elapse without *Monetary Trends* appearing, and further rewriting of the *Trends* manuscript lay ahead in 1980 and 1981.

The closer that book got to finalization, the more complete became the transition in Friedman's research status—from a producer of new studies and participant in research gatherings, to someone talked about by active researchers but himself mostly following other pursuits. That transition had proceeded over the 1970s, and it was at an advance stage in the closing days of 1978 when, at that year's American Economic Association meetings, Bennett McCallum observed that eleven years earlier, "Milton Friedman's suggestion that unemployment could be kept low only by accelerating inflation seemed radical; now even many activists doubt that it can be kept low by *any* monetary policy stance."[22]

As will be seen below, even during 1979 Friedman felt strongly about this issue that he used the occasion of discussions of inflation/unemployment relationship to stress that, unlike some of the research "activists" (as McCallum called them), he did continue to believe that monetary policy was highly nonneutral in the short run and that a successful U.S. disinflation would require a

---

New York's (1979) publication *Federal Reserve Readings on Inflation* had drawn exclusively from Federal Reserve System publications (remarks of May 15, 1980, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives, 1980b, p. 15). Reuss' criticism was not really well taken, however. The compilation did give voice to figures who were essentially outside the Federal Reserve System. Specifically, it reprinted (see Federal Reserve Bank of New York, 1979, pp. 89–106) the debate in the *Federal Reserve Bank of San Francisco Economic Review* of Friedman and Modigliani (1977), including the unfavorable remarks Friedman made in that debate on the Federal Reserve's record.

[20] The year did see the appearance for the first time of an Italian translation of the Friedman-Schwartz *Monetary History* and a German translation of *An Economist's Protest*. See Valentine (1987, p. 528).

A couple of potential misattributions of 1979 books by Friedman should also be mentioned. First, Milton R. Friedman issued *Friedman on Leases: 1979 Cumulative Supplement* (M.R. Friedman, 1979). Second, author Milton M. Friedman produced *An Adult Guide to Beginning Piano and Basic Musicianship* (M.M. Friedman, 1979). An additional factor liable to confuse the latter book with the output of economist Milton Friedman was the book was released by Prentice Hall, a past publisher of his own work.

[21] Friedman (1980b, p. 499).

[22] McCallum (1979b, p. 244).

protracted period of above-normal unemployment. But, in other respects, the manner in which McCallum placed Friedman's work in context amounted to something Friedman could agree with it. McCallum's summary conveyed the fact that Friedman's position on monetary matters, although once controversial and heavily disputed, had over the prior decade increasingly become the consensus view, as well as a jumping-off point for new research. This pattern was evident in the year in which McCallum's article appeared in print, 1979: Notwithstanding the dearth of new Friedman research publications, his impact continued to be felt heavily in the U.S. economics profession, including in the research world.

One of the manifestations of Friedman's longer-term influence came in the messages sent in 1979 by figures who were veterans, on the Keynesian side, of the older debates with him. For example, Paul Samuelson declared in August 1979 that there was only one type of Keynesian left—"quasi-Keynesians" (*Financial Times* (London), August 6, 1979). Earlier that same summer, another longtime Keynesian bastion, Harvard University, acknowledged Friedman's contributions by having him on the program of a commencement ceremony, at which Friedman was furnished with an honorary doctorate (*Boston Globe*, June 8, 1979). And, in a review of the state of macroeconomics as of the late 1970s, Michael DePrano—himself one of the Keynesian researchers who had had a printed exchange with Friedman during the debates of the 1960s (see DePrano and Mayer, 1965)—assigned Friedman a prominent place. In reviewing the previous decade's developments, DePrano made a point of highlighting the comparative lack of success and acceptance of Friedman's early-1970s research output and the fact that it had taken subsequent research by others to formalize some of Friedman's major contributions. But DePrano also acknowledged that Friedman's 1960s contributions had provided for the foundations for much of the agenda of macroeconomics in the 1970s.[23]

Developments in the policy world

This consolidation of Friedman's influence on the economics profession coincided with a time in which his influence on U.S. economic policy was nearing its maximum. Just as Friedman's influence on research in 1979 occurred despite the fact that he was not generating much new research output, his step-up in influence on policy in 1979 owed little to his direct participation in policy forums during that year.

[23] See DePrano (1979, pp. 21–23).

Some such participation did occur in the course of the year. Friedman's continuing activism in the area of constitutional limitations did produce the occasion for what turned out to be his final in-person testimony at a Congressional hearing.[24] But he had done more of this kind of activity in past years: in particular, 1959 and 1969 had seen him go to Washington twice to make two separate appearances at Congressional hearings. In contrast, although he did give one piece of spoken testimony on fiscal policy, he did not take the opportunity to testify in one of the myriad Congressional hearings held during 1979 on monetary policy and energy policy. And although, as discussed at the end of this chapter, Friedman was an insider in the Reagan presidential campaign, his participation as an adviser to Reagan in 1979 (and continuing into 1980) was far less extensive than of numerous others. He would not be as central to the Reagan campaign as he had been in the 1964 Barry Goldwater campaign or even the 1968 Richard Nixon campaign, and his input was limited in part by the fact that Reagan had a crowded field of economic advisers (consisting, other than Friedman, of veterans of the 1969–1977 Republican national administrations, confidantes Reagan had acquired over the years in California, and members of the supply-side movement). As indicated earlier, Friedman's 1979 influence on the shaping of national economic policy instead rested mainly in the influence of his prior body of published writings.

A busy celebrity

What mainly occupied Friedman in 1979 mainly occupied with making the next step in his evolution as a celebrity. Michael Canes, who, as a graduate student, had known Friedman at both the University of Chicago and Stanford University in the 1960s, and had stayed in touch with him, particularly on matters concerning energy policy, noticed Friedman's shift in priorities when, in summer 1979, he visited the Friedmans' East Coast residence of "Capitaf." "I took my family up to Vermont on vacation, and he had a home up there—a summer home in Vermont... And I thought, 'Well, this will be kind of nice. He's away, you know, out in the woods somewhere, and have a chance to chat for a bit, get to know him just a little better. And for my wife and the children, it could be kind of fun for them to meet this guy.'… And so we got in touch with him, and he invited me, and so we go up there. And, yeah, there he was—he and Rose, up there this place—idyllic-type place, and all of that. But it wasn't like he was isolated *at all*. When I got there, within 10 minutes or 15 minutes, a German camera crew was coming in there. And they were filming him for some show or special or whatever it was they were doing.

[24] See Section III below.

And he had other things going, too. So, while, you know, he was very pleasant and welcoming and all that stuff, he was in and out within 10 minutes. And Rose spent some time with us, and she was very gracious—you know, a very lovely person. But it didn't work out the way I thought it would, at all. He just was a very, very busy guy." (Michael Canes, interview, November 7, 2013.)

The main item among the "other things going" that this "very, very busy guy" had during 1979 was the making of the series *Free To Choose*—a process that overlapped, in its later stages, with the Friedmans' hectic writing of the book version of *Free To Choose*. It was in October 1969 that Senator William Proxmire had remarked to Friedman: "Some people say you have brought Adam Smith into the 20th century."[25] But it was a decade later that free-market activism actually occupied most of Friedman's time. The making of the *Free To Choose* series, which had begun in 1978 and had involved much location shooting, likewise accounted for much of his travel during 1979. It was work on the program that occasioned his long London in the spring, his visit to the University of Chicago in September (for the videorecording of the program's debates), and the Friedmans' trips to numerous other places in order to film sequences for the series.

By the end of the year, with production of the series complete in time for its scheduled early-1980 broadcast, Friedman was set to break into the television market as a presenter. And, in having a television program of his own, Friedman owed a definite debt to John Kenneth Galbraith.

Galbraith provides a precedent for ***Free To Choose***

In 1975−1977, Galbraith had set a template to which Friedman would subsequently adhere: writing and hosting a U.K./U.S. coproduction of a multi-part, one-hour series specifically on economics. Galbraith's series was, therefore, an important catalyst for *Free To Choose*. The success of the Galbraith television program both underlined the feasibility of a Friedman television project and created momentum for providing a long-form, televised economic discussion that provided a counterpoint to Galbraith's position.

Galbraith's series was titled *The Age of Uncertainty*. As early as August 1974, the *New York Times* referred to "the thirteen programs [actually, of course, thirteen *episodes* of a single

[25] From Proxmire's remarks in Joint Economic Committee (1970a, p. 810).

television program] he [Galbraith] is preparing for the British Broadcasting Corporation." The article—for which Galbraith supplied an observation that "Milton Friedman… is in the same category as the great witch doctors of the past"—related that Galbraith was already in an advanced stage of writing scripts for the various episodes (*New York Times*, August 4, 1974). As the series' preparation proceeded, Galbraith's television project received further prominent press coverage (see, for example, *Washington Star* (Washington, D.C.), April 23, 1975).

The production of the Galbraith series included location photography in Washington, D.C., in September 1975—when Galbraith gave some narration-to-camera from the Board Room, the traditional venue for in-person FOMC meetings (*Washington Post*, September 27, 1975). At that time, the series was already commissioned for broadcast in the United Kingdom by the British Broadcasting Commission (BBC), which produced the program and financed it in conjunction with the Canadian Broadcasting Corporation and Los Angeles' public-television channel, KCET (*South China Morning Post* (Hong Kong), April 25, 1975). The U.K. broadcast duly took place, with the program—which, as an in-house BBC production, benefited from the production values the BBC gave to documentaries—appearing on a weekly basis starting in January 1977.[26] Galbraith's series aired, it is true, on the channel BBC2, which, though it had a national audience reach, traditionally did not have the mass viewership in the United Kingdom of its sister channel BBC1. But by the standards of BBC2, it was a high-profile program—and it was well received.

In the United States, Galbraith's program was not on the schedule of the three major television networks and so had a lower profile than those networks' nighttime series. But *The Age of Uncertainty* received what was, in effect, a national U.S. broadcast, by being shown in primetime by many of the affiliate channels of the free-to-air, mostly-commercial-free Public Broadcasting System (PBS). The series also received extensive publicity when its U.S. broadcasts occurred. In the New York City area, the series' broadcast premiered on May 19, 1977 (*Sunday News* (New York), May 15, 1977). On the day of the premiere, New York City's mass-circulation *Daily News* newspaper ran a preview of what it called Galbraith's "splendid series," which it declared was "both historically sound and at the same time personal" (*Daily News* (New York), May 19, 1977).

[26] The *Washington Post* account (September 27, 1975) of the making of Galbraith's series stated that it would start its U.K. broadcast in 1976, and indeed Halliwell and Purser's (1986, p. 11) entry for the series registered its broadcast in the United Kingdom as having taken place in 1976. In fact, however, the series was always envisioned for 1977 broadcast (*South China Morning Post* (Hong Kong), April 25, 1975), and the 13-part weekly series began its U.K. airing in January 1977 (*Daily Mirror* (London), January 10, 1977).

The *Age of Uncertainty* series actually received widespread praise in the United States. Galbraith, after years of success in the market for popular and business books on economics, had now made a splash on television in both the United Kingdom and the United States with his series. "Here's television's first show on economics, and it's an economic success," Galbraith was quoted remarking after the U.K. airing of the program (*San Francisco Examiner*, May 15, 1977).[27] The U.S. press article so quoting Galbraith noted: "*The Age of Uncertainty* is the latest 'volume' in that superlative series of the BBC's 'television books' which began with Kenneth Clark's *Civilisation* and continued with Alistair Cooke's *America* and Jacob Bronowski's *The Ascent of Man*, and these have been shown and reshown on TV networks around the world." (*San Francisco Examiner*, May 15, 1977.) The article added that, in the area of actual books, Galbraith had produced "consistent bestsellers" since the 1950s.

Friedman was in his Vermont second home when this recitation of Galbraith's success appeared in the San Francisco press, so he was spared from reading it. But he had been aware of Galbraith's series for a long time. He had turned down the opportunity to confront Galbraith on a panel in an episode of the program, on the grounds that he did not want to be perceived as "a tail to his [Galbraith's] kite" (*San Francisco Examiner*, January 5, 1980). He had, however, agreed to make a preemptive strike on the program by giving an address in London (on August 31, 1976) at the start of the 1976/1977 U.K. television season in which Galbraith's program was airing.[28]

This talk, to the Institute of Economic Affairs, was necessarily concerned with Friedman's reactions to the critique of orthodox economics contained in Galbraith's past writings—so it conveyed Friedman's impressions from "reading Galbaith," rather than with the yet-to-be-broadcast television series.[29] The occasion received a decent amount of media coverage in the United Kingdom when it led off a Friedman pamphlet-cum-book, *From Galbraith to Economic Freedom*, that the Institute of Economic Affairs published at the end of January 1977 (during the fourth week of the U.K. broadcast of *The Age of Uncertainty*).[30] Friedman's talk was also broadcast on U.K. national radio as a 45-minute evening program, *Friedman on Galbraith*, on

---

[27] Implicitly, Galbraith was here distinguishing an economics-focused television program from series, like *The Money Programme* in the United Kingdom and *Wall Street Week* in the United States, that already existed when his program aired. Notwithstanding their heavy preoccupation with economics, these programs were primarily concerned with business and financial-market developments.

[28] Earlier on the same U.K. trip, during his talk at the Mont Pelerin Society meetings in Aberdeen, Scotland, Friedman had mentioned the fact that Galbraith was making a television series (Friedman, 1976f, p. 6; 1977h, p. 8).

[29] See Friedman (1977i, p. 13; 1978b, p. 53) and *The Listener* (London), April 21, 1977, p. 500.

[30] Press coverage included that in the *Evening Standard* (London), January 31, 1977.

March 8, 1977, as Galbraith's 13-part series neared its conclusion.[31] The pamphlet also appeared in 1978 in the United States as part of Friedman's book, *Tax Limitation, Inflation and the Role of Government*, discussed in the previous chapter.[32]

But the impact of this Friedman critique of Galbraith (which consisted, in considerable part, of his recapitulation of past analyses of Galbraith's economics by other economists) was small, both in the United Kingdom and the United States, when compared with that of the *Age of Uncertainty* series. And it did not become even the standard reference on critiques of Galbraith. Notably, the textbook discussion of Galbraithian economics in Baumol and Blinder (1979, pp. 822–823) did not mention Friedman's talk.[33]

Galbraith made *The Age of Uncertainty* a multimedia success for himself, as he produced a tie-in book that bore the same title of the series (see Galbraith, 1977) and whose release date (of March 29) was some weeks ahead of the U.S. broadcast of the series.[34] This publication added to Galbraith's track record of major sellers in the book market. In 1977, therefore, Galbraith had done once again what Friedman had (with the partial exception of *Capitalism and Freedom*) been unable to do—produce a major popular book. And he had stolen a march on Friedman in generating his own widely-watched television series.

But when it came to having a television series on economics and accompanying bestselling tie-in book, Friedman would end up having the last laugh. *The Age of Uncertainty* paved the way for Friedman's own series by setting a precedent for a television program that gave an academic economist's perspective on economics. At the time of the launch of his own program, Friedman acknowledged that "the Galbraith series undoubtedly stimulated people to believe that it was desirable to have a series with a different point of view and that it was possible to do something on television." (*The Plain Dealer* (Cleveland, Ohio), January 13, 1980.)

In 1977, the Friedmans had indicated that the Bronowski series *The Ascent of Man* (shown on U.K. television in summer 1973 and then having a U.S. broadcast in 1975) was their main initial template for what became *Free To Choose*, while also mentioning *Civilisation* (broadcast in the

---

[31] The radio version of the talk was also largely reproduced in *The Listener* (London), April 21, 1977.
[32] See Friedman (1978b, Chapter 4).
[33] Baumol and Blinder (1979) focused instead on Solow's (1967) review of Galbraith (1967). (Friedman's talk itself referred to this "extremely critical review" by Solow: see Friedman, 1977i, p. 27; 1978b, p. 60.) This remained true of discussions of Galbraith in later editions of the Baumol-Blinder textbook, such as Baumol and Blinder (1982).
[34] For the book's release date, see *Cedar Rapids Gazette* (Iowa), May 1, 1977.

United Kingdom in 1969).[35] Although the physical sciences (the subject matter of *Ascent of Man*) and art (the concern of *Civilisation*) were not strong personal interests of Friedman's, he had shown some attention to the historical developments of each of these fields, and he admired both series for their high production values and educational content. Even in his 1977 discussion, however, Friedman granted that "Galbraith's series... *The Age of Uncertainty*" was a further example of the "kind of thing" that had preceded his own planned series—while also implying that he hoped that his series would be regarded as highly dissimilar to Galbraith's.[36]

The fact that, in contrast to much popular perception, Galbraith did *not* represent the consensus of economists—and was not a producer of mainstream, peer-reviewed economic research—would also prove helpful to Friedman. The unrepresentative economic perspective of Galbraith's program, and in particular his critical view of market mechanisms, created pressure on the BBC and on PBS to agree to support a program presenting an alternative position.[37] And in 1977, as he became more familiar with the television world, Friedman was stepping forward to fill this gap.

Milton Friedman Speaks *and moving to the* ***Free To Choose*** *series*

It was in early 1977 that Friedman became involved in a prospective television program. On January 14, 1977, he met Robert Chitester in San Francisco.[38] "I was then a manager of a public television station [WQLN in Erie, Pennyslvania]," Chitester recalled. Through that position, he was familiar with the Galbraith series, which had just started its U.K. broadcast and scheduled for a PBS run in several months. "There was a need for a contrary expression [to *The Age of Uncertainty*]." (Robert Chitester, interview, July 9, 2013.)

Friedman recalled of the discussions with Chitester, "I agreed, subject to his ability to raise the money," adding: "I really didn't think it was going to happen" (*Wall Street Journal*, October 24, 1979, p. 32). Nevertheless, to help make it happen, the Friedmans cut back on other commitments. As part of this process, in mid-1977, they, in effect, terminated their long-running

---

[35] See Vahimagi (1994, pp. 170, 210) for the broadcast dates of these series.
[36] Instructional Dynamics Economics Cassette Tape 215 (December 1977, released January 1978).
[37] Friedman acknowledged this consideration as a factor in Friedman and Friedman (1998, p. 474).
[38] The date was given in Friedman and Friedman (1998, p. 471), as well as the back cover of the *Free To Choose* DVD box set.

audio commentaries.[39]

The Friedmans and Chitester worked out a format for a television program. But Chitester had reservations on the proposal that the three of them had converged on, even as he pressed ahead with arrangements to make the series. "Milton had it in his head that all he would have to do would be to do a series of lectures, and then we could throw a few pictures on the screen and that that would be a good TV series. Well, I didn't try to directly persuade him otherwise… but Milton came round to the recognition that that wasn't going to work. But, in the meantime, we went ahead, and we arranged for [Friedman to give] those fifteen lectures all over the United States. Well, about the third or fourth lecture in, Milton admitted to me, 'Well, Bob, I was wrong, and you were right, and now I'm stuck having to do the rest of these lectures.'" (Robert Chitester, interview, July 9, 2013.)[40] Indeed, in December 1977, by which time the broadcast series was firmly decided as being the documentary-plus-debate mix that would eventually characterize the broadcast programs, Friedman had given only seven of the lectures. He remained committed to giving, and did give, the remaining eight lectures in the first half of the coming year of 1978.

This series of fifteen lectures—under the overall title *Milton Friedman Speaks*—involved, as discussed in the previous chapter, travel by Friedman across various parts of the mainland United States. These series of talks—taped (or, in the case of one episode, filmed) from September 15, 1977, to May 19, 1978—consisted mainly of public talks or Friedman's contributions as a guest speaker at non-academic conferences. Friedman's initial confidence that these lectures would eventually air as a multi-part television series was exhibited during the first lecture (taped at the University of Chicago). In talking to the audience about the lecture in progress, he referred to it as "this TV show."[41]

---

[39] See the Friedmans' discussion in Instructional Dynamics Economics Cassette Tape 215 (December 1977, released January 1978). This farewell tape appeared more than six months after the Friedmans made their last regular recording in the series.

[40] As late as February 1978, it was reported that the *Milton Friedman Speaks* lectures then being made would form the basis for a fifteen-part 1979 television series (*Rochester Democrat and Chronicle*, February 24, 1978, p. 3A). However, the decision that the lectures would not be the main basis for the series, and that the lectures would be separately available in the videotape market, had already been settled by late 1977 (Instructional Dynamics Economics Cassette Tape 215, December 1977; released January 1978). The *Wall Street Journal* (July 17, 1978, p. 27) reported that the current plan (which would likewise be abandoned) was to intersperse the broadcast series with excerpts from *Milton Friedman Speaks* (which, the article also confirmed, would itself be marketed separately as a standalone videotape series available for order).

[41] *Milton Friedman Speaks*, Episode 1, "What Is America?," taped October 3, 1977, p. 10 of transcript.

"I think that the lecture series is a very impressive piece of work," Chitester observed in retrospect. Nevertheless, the lecture series was produced during a period when "I was struggling with him [Friedman] to come around to what television was." (Robert Chitester, interview, July 9, 2013.)

As already implied, the plan for Friedman's program to consist of a series of across-the-country lectures would be abandoned on the grounds that it constituted too stilted a format. As Friedman subsequently conceded, "there was no way to create an attractive TV show by taking extracts from lectures" (*Wall Street Journal*, October 24, 1979, p. 32). But, as indicated above, by the time decision was made not to follow this format in the actual television series, Friedman had started taping the lectures and was booked to give many more.

A newspaper article on Friedman that appeared at the time of the *Free To Choose* series in 1980 implied that the lectures recorded in 1977 and 1978 for *Milton Friedman Speaks* eventually "formed the basis" for the screened series (*The Observer* (London), February 17, 1980, p. 33). This, however, was not really the case. The lectures amounted to the abandoned initial template for the series. The actual series was a separate endeavor and seen as such by Chitester and the Friedmans by late 1977. The text of several of the lectures did find their way into print, usually in condensed versions, in the form of Friedman-authored newspaper articles and book chapters over the late 1970s and the 1980s. But the recorded *Milton Friedman Speaks* lectures did not find their way to any appreciable extent in the broadcast Friedman sequences in the *Free To Choose* series. For example, Friedman's exposition regarding how the process of production and delivery of a pencil exemplified the working of the market system appeared in both *Milton Friedman Speaks* and the first episode of *Free To Choose*. But the latter series used new footage of Friedman narrating the story from a desk, rather than replaying the much longer version of the story he had given in 1977 in his University of Chicago *Milton Friedman Speaks* lecture.[42] Nor did the lectures receive their own television broadcast. The sequence of lectures did, however, receive a limited commercial videotape release in 1979−1980—largely on the wholesale market

[42] See *Free To Choose*, PBS, episode 1, "The Power of the Market," January 12, 1980, pp. 3−4 of transcript. Friedman had told the "pencil" story in a talk at Lehigh University at Bethlehem, Pennsylvania, in February 1970 (*The Morning Call* (Allentown, Pennsylvania), February 6, 1970) and in *Milton Friedman Speaks*, Episode 1, "What Is America?," taped October 3, 1977, pp. 10−15 of transcript, as well as Friedman (1977o, p. 10), in each case crediting it to Leonard Read. He also credited the story to Read without actually recounting it, in Friedman (1976f, p. 16; see also Friedman 1977h, p. 11). See also his remarks in CSPAN, November 20, 1994, p. 9 of transcript.

rather than as sell-through videocassettes.[43] A generation later, within a couple of years of Friedman's death, *Milton Friedman Speaks* would finally be issued to the U.S. retail market, in the form of a DVD box set.

The upshot of the decision to abandon *Milton Friedman Speaks* as the basis for a television program was that Friedman moved closer to the Galbraith template of an economist-narrated documentary series. It was this more ambitious conception of Friedman's television series that would constitute *Free To Choose*. The production of this series would occupy Friedman for much of the final two years of the 1970s.

The power of television

Free To Choose signified a recognition on Friedman's part of what he called "the power of television" as a means of reaching the public.[44] He had generally been only an unenthusiastic consumer of television, having expressed reservations about the broadcast media for years. Even in the *Milton Friedman Speaks* lectures, Friedman had remarked acidly that TV and radio provided "what some people regard as entertainment."[45]

Earlier (*Newsweek*, December 1, 1969), Friedman had referred to the "deadening uniformity" and "limited choice" associated with U.S. network television, which he viewed as operating in an environment in which only mass-audience products emerged and niche-audience programs would not be commissioned. When, in May 1978, Friedman referred to the "wasteland… in television" (even while he was giving a talk then planned to be part of a television series), this was one of a number of occasions on which he appealed to the "wasteland" description that one-time Federal Communications Commissioner Newton Minnow had made in the early 1960s when referring to the content of U.S. broadcast television.[46]

---

[43] Ordering information for that video series would be provided on the dust jacket of the U.S. hardback version of the *Free To Choose* book. Despite its appearance in such a prominent location, his information was apparently intended for promoters of the book rather than for the everyday reader.
[44] The quotation is from Friedman (1982c, p. vii).
[45] *Milton Friedman Speaks*, Episode 14, "Equality and Freedom in the Free Enterprise System," taped May 1, 1978, p. 20 of transcript.
[46] The Friedman quotation is from *Milton Friedman Speaks*, Episode 14, "Equality and Freedom in the Free Enterprise System," taped May 1, 1978, p. 33 of transcript. For earlier, related statements, see Friedman (1970c, p. 720), Friedman's reference to "a wasteland of television, in the phrase that Minnow used some years ago" (*Milton Friedman Speaks*, Episode 4, "The Role of Government in a Free Society," taped February 9, 1978, p. 26 of transcript), and Friedman's (1962c, p. 284) *Price Theory* text. Minnow made his statement in May 1961, so the invocation of it in the problem-set part of *Price Theory* was testament to the fact that the problem questions in that text pertained primarily to the 1960/1961 version of the class. Minnow was one of only two people referred to in

Friedman attributed this situation to the regulatory framework of U.S. television and contrasted that with the book industry, in which "Westerns, mysteries, and popular romances" were mass sellers, but in which more limited-readership publications were also viable.[47] Friedman lamented governmental and network opposition to the emergence of pay TV—an alternative that he saw as one means of securing more diverse program content (*Newsweek*, December 1, 1969). Along these lines, Friedman observed in May 1976: "The FCC [Federal Communications Commission] has been a major obstacle to the advance of competition—it has slowed the introduction of pay TV, of cable TV, and of other new methods of providing programs. The FCC has been dominated by the networks."[48] During the 1970s, Friedman also looked forward to the spread of videocassettes as an alternative to television.[49]

But Friedman bowed to the reality that television had become and would remain a means of mass communications. "Television is hard to turn down, given the chance to address such an enormous audience," he observed (*The Observer* (London), February 17, 1980, p. 33). Even before Galbraith's program provided an example of a show specialized on economics, Friedman had expressed an interest in raising the standard of economic coverage in television.[50]

The economic deterioration of the 1970s had brought economic discussion more to the fore in television news coverage. As indicated in Chapter 8, the year 1977 when Friedman started his television project was a year during which he already anticipated the return to double-digit inflation of 1979 and 1980. Once this indeed occurred, it would have the effect of making a television series dealing with the economy even more topical when the program went to air in early 1980.

Friedman's television experience did not, of course, begin with *Free To Choose*. Nelson (2020a,

the original version of *Price Theory* (in Minnow's case, the reference consisting of being quoted but not named) who were still alive sixty years after the book's publication (the other individual being Arnold Harberger, mentioned on page 266 of the text). Minnow died on May 6, 2023.

[47] Friedman (1970f, p. 73).

[48] From Friedman's remarks of May 25, 1976, in Friedman and Nader (1976, p. 33). See also his remarks in *Speaking Freely* (WNBC, May 4, 1969, p. 35), Friedman (1970f, pp. 72–76), Friedman (1977i, p. 39) (reprinted in Friedman, 1991a, p. 146), *Reason* magazine (August 1977, p. 29), *Milton Friedman Speaks*, Episode 4, "The Role of Government in a Free Society," taped February 9, 1978 (p. 13 of transcript), and *Milton Friedman Speaks*, Episode 14, "Equality and Freedom in the Free Enterprise System," taped May 1, 1978 (pp. 32–33 of transcript) for expressions of similar sentiments. Friedman had earlier called for the FCC's abolition during a 1971 appearance in Detroit (*Detroit Free Press*, March 9, 1971).

[49] See *Playboy* (February 1973, p. 58) (reprinted in Friedman [1975a, p. 17; 1983b, p. 26]), and *Milton Friedman Speaks*, Episode 14, "Equality and Freedom in the Free Enterprise System," taped May 1, 1978, p. 34 of transcript.

[50] *CBS Morning News*, CBS, February 17, 1976, p. 21 of transcript.

2020b) and previous chapters of this book have had occasion to refer to numerous television appearances that Friedman made dating back to the 1950s—including a regular spell as a commentator on *CBS Morning News* in the mid-1970s (see Chapter 6 above). Indeed, at the very start of the first *Free To Choose* broadcast, Robert McKenzie, moderator of the debate portions of the program's U.S. episodes, described it as "Milton Friedman's first major television series." In making this qualified statement, McKenzie may have been alluding to the occasional commentaries for *CBS Morning News*. But he was also likely mainly referring to the many occasions in the past when Friedman had appeared at length as a guest on others' television series. These included longtime local Chicago television broadcasters like Elliot Janeway and Irv "Kup" Kupcinet.

The most prominent example of a talk show featuring Friedman—because of the frequency of his appearances, because it was a national show, and because he had been, on a number of occasions, the sole guest, appearing for the full length of the broadcast episode—was, however, likely *Donahue*. Phil Donahue had been a pioneer of the format of the daytime, studio-audience participation public-affairs-oriented talk-show format later associated with Oprah Winfrey. Years later, Donahue would recall (*Piers Morgan Tonight*, CNN, January 7, 2012): "We seldom repeated a guest… Not at all—[or] very few." But Friedman was an exception to this generalization.[51] Donahue's move to the city of Chicago in 1974 led to multiple Friedman appearances on the nationally-syndicated program. Friedman appeared on *Donahue* more than once a year in the period from 1974 to 1976.[52]

In September 1979 and in the early months of 1980—a period during which taping of the debate portions of, and then the publicity tour for, the *Free To Choose* PBS episodes brought him back

---

[51] In the 2012 interview, Donahue cited Ralph Nader as one of the exceptions. In addition, many show business personalities made repeat appearances on *Donahue*, which was not invariably a current-events program and often covered current movie or musical releases.

[52] Friedman appeared in *Donahue* on May 1, 1974, again in March 1975, and in consecutive episodes in September-October 1975, followed by another appearance in November 1976. He may also have appeared in other episodes over this period. In the recollection of Gloria Valentine (personal communication, January 15, 2009), "Professor Friedman appeared on too many *Donahue* shows while we were in Chicago[,] and I never had any written confirmation of his appearances because Phil Donahue would call and ask him to appear. It was all too convenient because the show was indeed broadcast from Chicago." She added with regard to Friedman's *Donahue* association, "My reaction is so unfavorable because we would be deluged with a mountain of correspondence… [T]he deluge would continue for a long time because the show would be aired in different parts of the country at different times… During the airing of a *Donahue* show, the address of the guest would appear repeatedly on the screen. Apparently a very large number of the viewers felt they should write to the guest because of the address appearing. Actually we received some letters that said, 'I saw your address and thought I would write to you. Sincerely yours, (name).'"

to the city of Chicago—Donahue had Friedman back as a guest. Friedman made a total of three appearances on Donahue's programs over these months.[53]

A remark that Donahue made on the first of these appearances shed light on how Friedman had reached national celebrity: "One of the wonderful things about you is that, when you speak, I almost always understand you." By 1980, Friedman's success in communicating his economic views to popular audiences had encompassed both popular written outlets like *Newsweek* and television, and, in the realm of television, it had traversed both specialist financial-news programs like *Wall Street Week* and general-audience programs like *Donahue*.[54]

In his September 1979 *Donahue* appearance, Friedman—in reply to a challenge from Donahue that the market system operated on "greed"—gave his own perspective on the market system.[55] "Well, first of all," Friedman replied, "tell me, is there some society you know that *doesn't* run on greed? You think Russia doesn't run on greed? You think *China* doesn't run on greed?... The world runs on individuals pursuing their separate interests… In the only cases in which the masses have escaped the kind of grinding poverty you're talking about, the only cases in recorded history are where they've had capitalism and largely free trade. If you want to know where the masses are worst off, it's exactly in the kinds of societies that depart from that. So that the record of history is absolutely crystal clear that there is no alternative way so far discovered of improving the lot of the ordinary man that can hold a candle to the productive activities that are unleashed by a free enterprise system." He added: "You know, I think you're taking a lot of things for granted. Just tell me where you're going to find these angels who are going to

---

[53] Two of them (in early September 1979, and in April 1980) were on Donahue's daytime talk show, and a third (late September 1979) was on NBC's *Today* early-morning show—to which Donahue at the time was a contributor, providing interviews from Chicago.

[54] Larry King (in the early 1980s still primarily a radio show host) also had Friedman as a guest on multiple occasions, naming him in L. King and Yoffe (1982, p. 47) as one of the celebrities he had interviewed. One occasion on which King interviewed was on May 30, 1980, when Friedman was at the Amway Corporation Leadership Convention of May 30, 1980, for King's radio program. (Gloria Valentine, personal communication, November 24, 2008.) Friedman later appeared on King's CNN television program a few weeks after the 1987 stock market crash (*New York Times*, November 26, 1987).

[55] Although *Donahue* episodes were essentially ephemeral, not being rebroadcast after the television season in which they originally appeared, the 1979 *Donahue* episode featuring this Friedman statement was kept in the public eye because it was issued (along with a separate *Donahue* instalment, in which Ayn Rand was the guest) in a commercially-available videotape—released in 1994, long after the broadcast year. The 1979 Friedman *Donahue* episode (along with excerpts from it) was later uploaded to YouTube and other internet outlets. Some of these outlets erroneously gave the date of the episode as 1980. The correct date for this episode, used in Nelson (2009a, 2009b) and here, was obtained by the author via consultation of newspaper television program listings on microfilmed and internet-scanned back issues of newspapers published in the Chicago and New York City areas.

organize society for us. I don't even trust you to do that—let alone myself."[56]

Friedman had made similar statements before.[57] But this delivery of it on television, and its forceful, uninterrupted and self-contained character, meant that the vignette became (posthumously, via the internet) one of Friedman's most remembered sound bites—far more well-known than any single moment in the *Free To Choose* television program.

Notwithstanding his frequent appearances on TV as an interview subject or guest panelist, Friedman knew little before *Free To Choose* got off the ground about the production side of television. His limited experience with the medium as of early 1977 was evident in the fact that, at this time, Friedman was still using the term "TV producers" to mean manufacturers of television sets (Instructional Dynamics Economics Cassette Tape 210, March 1977, Part 2).

Over the following three years, however, Friedman became steeped in the making of television programs. Chitester recalled that, when they arrived at the *Free To Choose* format, which would involve considerable direct-to-camera monologues by the host, Friedman observed, "I could never do many, many takes, or anything like that." In the event, as Chitester noted, "He did exactly that [many takes]. But it took a while, and he had to grow into it." Friedman "learned on the job" when it came to television, Chitester remarked, adding: "He just immersed himself in [the questions], 'How do you do this, or do that? What is the craft of television production?'" (Robert Chitester, interview, July 9, 2013.)

Public television

Neither Galbraith nor Friedman broke through, via their programs, into the big time of U.S. commercial network television. Rather, each of their programs was shown on the Public Broadcasting System (PBS), the American public-television network.

Public television, in the U.S. context, does not mean state-owned television. The "public" part instead refers to the tax deductibility of private-sector donations to PBS, to the provision of some

---

[56] *Donahue*, NBC, September 6, 1979.
[57] For example, in his 1973 *Playboy* interview, Friedman asked (February 1973, p. 66 [Friedman, 1975a, p. 31; 1983b, p. 50]): "What kind of society isn't structured on greed?" And in a 1976 interview with Peter Jay on U.K. commercial television, Friedman had stated in response to a Jay remark: "Stop at that point. Can you name me a system which is not based on greed?" (*The Jay Interview*, ITN, July 17, 1976.)

federal government financing of PBS, and to the general absence on the network programs of within-program commercial interruptions.

Although a recent study of aspects of the creation of the *Free To Choose* program asserts that the fact that *Free To Choose* was a PBS broadcast amounted to "privatizing the production of public television" (Jack, 2018, p. 514), the implied claim that *Free To Choose* set a precedent on this score is highly questionable. PBS had, in fact, routinely purchased programs made by commercial enterprises in the past. And, with regard to payment for the broadcasts made by PBS, it was noted well before *Free To Choose* became a reality that "a key slice of public television's support [is] the sponsorship of high-quality, primetime programs by major U.S. corporations" (*Dayton Daily News* (Ohio), February 24, 1977).

In the case of *Free To Choose*, Robert Chitester and his production colleagues made the program by raising private-sector financing from various corporations and foundations, making the series using their own production companies, and selling to PBS the initial U.S. broadcast rights to the series. The total amount raised was $2.4 million (*The Plain Dealer* (Cleveland, Ohio), January 13, 1980). The fact of the corporate sponsorship and the identities of some of the sponsors were given in press coverage of *Free To Choose* in 1979 and 1980, and the Friedmans provided a long list of the sponsors (corporations and foundations) in *Two Lucky People* in 1998.[58] In contrast, Jack (2018) presents the sponsorship details as a revelation obtainable only by a perusal of unpublished items in the Friedman archives—and does not even cite *Two Lucky People* (which had a whole chapter, as well as an appendix, concerned with *Free To Choose*) or even the *Free To Choose* book, let alone any other Friedman book or article.[59] In addition, Jack's (2018, p.

[58] See Friedman and Friedman (1998, p. 603). The list was out of alphabetical order—and was perhaps given in order of size of donation. It was not a complete list of donors. For example, it did not include the Smith Richardson Foundation—which had donated $16,200 to the project (*The Greensboro Record* (North Carolina), March 12, 1979, p. B2).

The *New York Post* (March 4, 1980) had one of the reports of donor numbers for *Free To Choose*. It indicated that the Sarah (Mellon) Scaife Foundation had given $500,000, Getty Oil $330,000, and Readers Digest Association $300,000.

[59] That is, Jack (2018) treats access to the Friedman archives as a *substitute* for an examination of Friedman's published writings and of the economic-research literature on Friedman. These aspects of the citation and analytical practices of the Jack (2018) study actually preclude it from being able to address properly the premise of the article's title—that the series advanced "libertarian ideology." For, by not considering the specialized economic literature contained in the research and textbooks authored by economists, Jack is not in a position to distinguish ideological aspects of *Free To Choose* from those respects in which Friedman was articulating the consensus of economists or was voicing positions that hardline libertarians would oppose. Two other notable shortcomings of the Jack (2018) study are: (*a*) it mentions (p. 527) the Federal Reserve Bank of Dallas' 2003 conference on *Free To Choose* without citing the resulting proceedings volume (see Wynne, Rosenblum, and Formaini, 2004); and (*b*) it gives the wrong year (1990, instead of the correct year of 1991) for the CNBC repeat/update of the series (p. 527).

517) claim that Galbraith's PBS series included, and Friedman's PBS series did not, "coverage of a broad range of economic ideas" is at variance with the fact that Friedman debated critics of his views in the second half of the first nine episodes of the programs broadcast on PBS.[60] Indeed, as was indicated at the start of this chapter, he came under withering criticism in these debates.

Friedman's evolving attitude toward his public role

Although PBS was not the same as "big three" network television, the fact was nevertheless that Friedman now had his own television program. His effort to reach this point reflected, in part, a change in his own perception of his public function.

Friedman had, of course, long had another life as a *Newsweek* columnist: "The way to get the Nobel prize is obviously to write a column for *Newsweek*," Friedman had quipped on the day his Nobel was announced (*Chicago Daily News*, October 14, 1976, p. 17; also in *The Oregonian* (Portland, Oregon), October 15, 1976) and, striking a more serious note a little later, he cited his *Newsweek* column as what "has probably kept me in the public eye, more than anything else" (*Chicago Tribune*, November 28, 1976). But, notwithstanding this and his many other engagements, from the 1940s onward, in media discussions of economic policy, Friedman until the late 1970s had characterized his role in advocating policy change in quite circumscribed terms. His extensive public policy work had remained, until that time, essentially moonlighting from his main role as a researcher and teacher. He was quoted saying two weeks after receiving the Nobel that he was "just a college professor" (*Milwaukee Sentinel*, October 30, 1976).[61]

Furthermore, when it came to his public pronouncements, Friedman's position was: "It's not my job to persuade people about things." He described his function as, instead, one of keeping ideas alive so that they remained policy options for the future (*Chicago Daily News*, October 14, 1976,

---

[60] Episode ten was a wrap-up episode, in which Friedman again faced skeptical questioning.

[61] Anna Schwartz's (1979a, p. 67) profile of Friedman also described him as (having been) a "college professor." Friedman used this specific term on a number of occasions in characterizing his position (for examples, see Nelson, 2020a, Chapter 4, as well as Instructional Dynamics Economics Cassette Tape 10, January 1969). It was, however, a little unusual as a label for University of Chicago economics professors of Friedman's era, as "college" at that university referred specifically to the undergraduate population, for whom Friedman taught classes only infrequently. William Dewald, at the university in the early 1960s, recalled the situation as follows: "I taught undergraduate as well as graduate level courses at Chicago, as did some others, too. Senior faculty didn't teach undergraduate classes, although many gave individual lectures in undergraduate classes." (William Dewald, personal communication, November 7, 2013.)

p. 6).[62]

Even before the 1970s, however, Friedman's activities were not really as circumscribed as this description suggested. He certainly tried to persuade economists, policymakers, and business people in his personal interactions with them.[63] In addition, his *Newsweek* column aside, Friedman's pre-1970 public activities included such high-profile ventures as participation in the Goldwater and Nixon presidential campaigns and his activism in various forums on abolishing conscription. Then 1970−1971 had seen considerable public activism on Friedman's part as he urged, unsuccessfully, that aggregate demand restraint be continued and then opposed wage and price controls once Nixon introduced them. Indeed, with regard to Friedman's outlook toward monetary matters, Patinkin (1984, p. 99) would liken Friedman to Keynes on the grounds that both economists regarded the galvanization of public opinion in support of their policy positions as a key part of their task.[64] Those who worked with Friedman shared this assessment. Anna Schwartz (1998b, p. 5) noted that in the areas of both monetary economics and market economics, Friedman based his case on reasoned argument but nonetheless was "basically an evangelical, with [a] crusading zeal to make readers and listeners understand his vision." Rose Friedman, long involved in the public-policy aspects of her spouse's activities, stated (*Daily Mail* (London), March 18, 1980): "His life is committed to telling people: 'We are going down the wrong tracks, and that is why countries like America and Britain are having so many problems.'"

Nonetheless, for a long time, Friedman largely resisted the characterization of himself as someone whose task was to persuade people on matters of economic policy. The advent of *Free To Choose* confirmed a change in his position. In the first episode of the series—for which the

---

[62] Friedman articulated this picture of his role on several occasions. See Nelson (2020a, Chapter 9). This particular 1976 quotation was repeated by the *San Francisco Chronicle* (January 20, 1979, p. 9) when advertising a forthcoming series of Friedman op-eds for the newspaper.

[63] In *The Times* (London), September 28, 1982, Rose Friedman suggested that their joint memoirs would talk about Friedman's long-running attempts to persuade fellow economists of his views, and Friedman (1986b, p. 3) would later recall his interaction with Federal Reserve Board members as consisting of trying to persuade them of the merits of a constant-monetary-growth rule. (As well as his one-on-one interactions with Board governors and chairs, Friedman probably had in mind his appearances at the outside consultants' meetings with Board governors from 1965 to 1978, discussed in the previous volume and previous chapters of this book.) In addition, in a talk on May 7, 1970, when defending the Nixon Administration's and the Federal Reserve's disinflationary strategy against calls for a macroeconomic U-turn, Friedman (1970g, pp. 64–65) told an audience of executives that he was trying "to persuade people like yourself that many of the policies which you propose, and that you bring pressure for, are most unwise…"

[64] Patinkin, who lived outside the United States, probably had in mind Friedman's popular writings, many of them pre-*Free To Choose*.

broadcast date, in many U.S. markets, was January 12, 1980, although in some cities it debuted a day or two earlier—Friedman acknowledged that he, too, now perceived his role as one of pushing along public opinion: "my whole function and purpose is to try to persuade the people, to make a different thinking politically profitable."[65]

Friedman "has not shrunk from advocating and defending novel and unorthodox ideas in public forums," Anna Schwartz noted in a mid-1979 profile of Friedman in *Challenge* magazine.[66] "This unusual degree of engagement," she went on, "…has made him a celebrity."[67] Indeed, by this time—even before the release to the public of the *Free To Choose* book and television program—Friedman had, in the estimation of many, already passed Galbraith in national fame, with another magazine's interview with him naming him "America's best-known economist" (*Expo*, Summer 1979, p. 16).

Schwartz's profile of her longtime writing partner also referred explicitly to what had cast a pall over Friedman's fame in the second half of the 1970s: "organized demonstrations have been conducted against him" over Chile. Schwartz saw this outcome as stemming from a prevalent practice of incorrectly attributing to Friedman a "support for the military regime in Chile," but she acknowledged that the critics' attacks on Friedman on this issue had built up an image of him as a "hardhearted reactionary" in some circles.[68] During 1979 and into the new decade, Friedman would continue to have some of his public engagements interrupted by protests related to Chile.

---

[65] *Free To Choose*, PBS, Episode 1, "The Power of the Market," debate portion, p. 10 of transcript. The preface to the *Free To Choose* book went some way to reconciling Friedman's varying attitudes about persuading people, telling the readership that the "only person who can truly persuade you is yourself," yet expressing the hope that the book would shape the reader's views (Friedman and Friedman, 1980, p. xvi). (Friedman also quoted this passage in Friedman, 1982c, p. viii.)

[66] Note that Schwartz, correctly, did not put a "for" after "advocating"—clearly showing conscious or unconscious awareness that placement of the word "for" in between "advocating" and the item being advocated was neither necessary nor appropriate (see, for example, Merriam-Webster, 2002, p. 31). Likewise, the joint writings of Friedman and Schwartz make it clear that they were aware that the correct formulation was "advocacy of" (when referring to making the case in favor of a concept or policy), not "advocacy for"—see, for example, Friedman and Schwartz (1963a, pp. 227, 383). The same awareness has not been present in a couple of the recent writings on Friedman cited above. Jack (2018) repeatedly incorrectly refers to "advocating for" and "advocacy for" free-market economics. By this curious rule, Friedman's (1943, p. 61) statement, "The spendings tax has been advocated for many years" would instead be rendered as: "The spendings tax has been advocated for for many years." (Jack's only instance of correctly omitting the "for" is actually when quoting Friedman-composed materials—see Jack, 2018, p. 519.) In a related vein, Appelbaum (2020) similarly incorrectly used "advocacy for" or "advocate(s) for" on a total of five occasions and the correct construction only once. This improper usage was especially jarring in light of the fact Appelbaum's piece was a preface inserted into a reissue of a Friedman book that used the terms correctly.

[67] Schwartz (1979a, p. 67).

[68] Schwartz (1979a, p. 67).

Meanwhile, in Chile itself, in 1979 saw a momentous, and ultimately disastrous, move in economic policy, when, in March, its exchange rate was fixed at a high level against the U.S. dollar—just ahead of the early-1980s period of sharp dollar appreciation and world commodity-price weakness (see Dornbusch, 1986, p. 2). The economic crash in 1982 that flowed from this decision would set off an intensification of the criticism in the international media Friedman over Chile's economic policy—and, for some time, would end Friedman's ability to point toward sizable growth in real income as being associated with the economic policies instituted by the junta.

The Chile issue flared up at the mid-December 1979 Hoover Institution conscription conference at which Friedman was one of the presenters, when a pro-draft audience member implied that Friedman's visit to Chile meant that what he said on other matters, including conscription, should be dismissed. The session chair, Albert Rees, ruled the intervention out of order without seeking a response on Friedman's part.[69] Earlier, during one of the *Free To Choose* panel debates videotaped in Chicago in September, one of Friedman's critics, Frances Fox Piven, raised the matter.[70] In response, the moderator, Robert McKenzie, indicated that he did not want the panel discussion to dwell on Chile.[71] Friedman nevertheless had already briefly responded, staying that "Chile is not a politically free system, and I do not condone the political system. But the people there are freer than the people in communist societies, because government plays a smaller role because [of] the free enterprise that has been emerging." He reaffirmed that he would like to see Chile "get rid of the junta."[72]

The development of the series

The debate portion, although an agreed part of the broadcasts for the United States, was a late step in the production of the *Free To Choose* series. Indeed, the panelists at those September 1979 debates had as the jumping-off point of their discussions the filmed documentary portion of the episode, hosted and narrated by Friedman. The part of the series that was being developed during 1977 and 1978, and then made mainly from summer 1978 to summer 1979, was the documentary portion.

It was in these filmed episodes that U.K. writer Antony (Tony) Jay had a key production role. His involvement began once Friedman and Chitester arranged for Jay's U.K. company, Video Arts, to make the series. Tony Jay recalled: "He [Friedman] tried to find people in America to produce it, and he found anybody who wanted to produce it also wanted to tell him that he was wrong and that he didn't understand. So he approached his friend Ralph Harris at the Institute of Economic Affairs and said, 'Well, is there anybody in England who could set this up?' Knowing that I was a film producer, Ralph got in touch with me and said would I be interested." (Sir Antony Jay, interview, May 29, 2013.)

Although he had longstanding sympathy for free-market ideas, Jay had had problems gaining a good feel for the economic analysis associated with those ideas. In this connection, his confidence in Friedman's public communications skills was bolstered when Jay read Friedman's *Playboy* interview.[73] "I'd given up on the idea of ever understanding economics by reading, or trying to read, the standard economic books, and then suddenly I read this interview in *Playboy*. And I thought, 'Well, if that's economics, I can understand it,' because [in the interview] Milton is so lucid, and so down to earth, and practical and factual." (Sir Antony Jay, interview, May 29, 2013.)

Tony Jay viewed it as imperative that the monologue portions of the series not seem like lectures to the viewer: "when you're doing a television documentary like that, you're really only talking to one person. Whereas, in a lecture, you're talking to a roomful—a lecture theater-full." Friedman expressed some worry about losing control of the series and initially expressed considerable irritation with Jay's suggestions in correspondence and by telephone.[74] Jay noted that, nevertheless, Friedman came to appreciate the merits of Jay's posture "very quickly… Milton very quickly got onto the idea—that it's a personal talk, a talk to a single person, and it's not the same as a public lecture." (Sir Antony Jay, interview, May 29, 2013.)

Compression and simplification of the program's scripts also ensued from the recommendations of Jay and Chitester. Tony Jay recalled with regard to Friedman's scripts that "the original drafts

---

[73] See also Friedman and Friedman (1998, p. 411). On the basis of that account, it would seem that the Friedmans had the impression that Tony Jay had read the interview well before the conversations about the *Free To Choose* project. However, Jay's recollection (interview, May 29, 2013) was that, when the Institute of Economic Affairs approached him about possible involvement in the *Free To Choose* project, "I think they sent me the *Playboy* interview." Jay did note that, through his longtime interest in current affairs, he had, by this time, considerable familiarity with 'Friedman's political-economic approach, which I absorbed quite a lot in years previously." (Sir Antony Jay, interview, May 29, 2013.)

[74] See Friedman and Friedman (1998, pp. 479–480).

were terribly detailed, and went on and on supporting things with arguments—which would bore the audience. And we said [to Friedman], 'No, this is television. If people really want to know the details of the argument, they can get your books and look into it further. But [on television] all you've got to do is to put forward your view—not endlessly support it with argument and refutation.' And I think Milton, being very quick-minded, saw this and went along with it." (Sir Antony Jay, interview, May 29, 2013.)

Friedman accordingly went for script simplification. However, he *did* use scripts. Although a *Wall Street Journal* report on the 18-month making of the programs (October 24, 1979, p. 32) implied that the material he delivered to the film camera in the episodes was spontaneous, being unprepared except for their general gist, this was not to the case.[75] Friedman did prepare scripts of what he planned to say and, as already indicated, he made multiple takes of his deliveries to camera. His observation to the *Wall Street Journal* reporter that "I'd be dead as a doornail if I had to read scripts" (*Wall Street Journal*, October 24, 1979, p. 32) and his later remark that "I insisted we have no script" (*Chicago Tribune*, July 20, 1980, p. F21) did not actually imply that his addresses to camera consisted of full-scale ad-libbing.[76] Instead, they were references to the fact that the words he used in the program were his own—and to his practice of not memorizing or reciting the scripts he had prepared. In the course of his multiple takes, Friedman did make changes to his to-camera narration, with these alterations partly reflecting his consultations with the production crew on making improvements in his exposition.

A combination of international filming, direct-to-camera monologues by Friedman on location, and narration by Friedman of other location footage, became the format of the main portion (the filmed documentaries) of the *Free To Choose* episodes.

For the shooting of these programs, Tony Jay (who would eventually take a "Creative Consultant" credit for the series) recalled that his Video Arts company secured for *Free To Choose* "a terribly good director called Michael Latham, who got on terribly well with Milton… And, actually, Milton was terribly impressed with Mike Latham and his understanding of communication." The *Wall Street Journal* on-set report noted that Latham shared with the director on-set consultations with Friedman regarding upcoming scenes to be shot. However,

---

[75] The videotaped second halves of each episode—the free-for-all panel debates—were indeed unscripted.
[76] Friedman had also affirmed that the television program was unscripted in *New York Times*, February 24, 1980.

Latham's formal role was of producer of (the filmed portions of) *Free To Choose*.[77] The contemporaneous *Wall Street Journal* report on the making of the series observed that Rose Friedman, who had no on-screen role in the program but was one of its associate producers and was constantly present during filming, played an important role in honing the manner and substance of Friedman's deliveries in the series. Tony Jay recalled that Latham encouraged this process during filming: "he was very good, also, in bringing Rose into it, because she was really quite important, and Milton paid a lot of attention to her judgment." (Sir Antony Jay, interview, May 29, 2013.)

When it came to Friedman traits that were on display as they made the program, Tony Jay recalled being especially "impressed by two things, really. One was his intellectual clarity, and the other was his wonderful good humor. And when we were filming *Free To Choose*, even if the assistant cameraman disagreed with him [on economics], he'd have a long conversation with him to try and show him he was right, but, always, he was in terribly good humor. He was never vindictive or confrontational. He was persuasive." (Sir Antony Jay, interview, May 29, 2013.)

The 1979 portion of the making of the series coincided with the Friedmans' frantic drafting of the book version of *Free To Choose*. "We started writing on January 1, 1979, we delivered the manuscript in September, and our book was in the bookstores by Christmas," Friedman observed. We literally worked on it morning, noon, and night. I tell you: I'll never do anything on such a tight deadline again." (*New York Times*, February 24, 1980.)

The broadcast of the television program and the widespread distribution of the book would both begin in the first half of January 1980 and would be accompanied by a series of publicity appearances by Friedman. The broadcast episodes of *Free To Choose* and the accompanying book, and the reception that each received, will be analyzed in detail in the course of the next chapter's coverage of developments in 1980.

Teaching judges

Although the teaching of university students was now behind him, for Friedman in 1979 the teaching of economics courses was not quite over. 1979 saw the culmination of Friedman's involvement as one of the lectures in a special short course in economics principles. This was

[77] In the BBC documentary tradition (from which Latham came), the producer had an activist function in filmed-on-location documentary programs, of the kind often reserved solely for the director in other areas of television and film (see Halliwell and Purser, 1986, p. 656).

teaching in a loose sense: the course of lectures would be delivered to U.S. trial judges. Consequently, considerable audience participation was par for the course—making the occasion more of a seminar-conference program.

The annual series of economists' lectures provided to U.S. judges was organized by Henry Manne of the University of Miami. The series began in 1976/1977 academic year, and Friedman was a lecturer in the initial three years for which the lecture program—called the Economic Institute for Federal Judges—was offered.[78]

Manne quipped that "the first program we had in economics for federal judges was the greatest economics faculty ever assembled in the history of the world." Paul Samuelson and Almen Alchian were among Friedman's fellow teachers. "It was a fantastic group," recalled Manne, "and they were all magnificent teachers, and all of them sensed, I think, the importance of what we were trying to do." (Henry Manne, interview, April 30, 2014.)

Manne added that "Paul Samuelson was the only one who was leery about it." Samuelson was concerned that the course would talk up free markets instead of being an exposition of straight economic analysis. But, as the course proceeded, Samuelson was won over, having become satisfied that its intent was to provide a serious exposition of technical economics. Indeed, Samuelson continued to participate as a teacher of the course for several years after Friedman ended his own involvement in it. "Milton and Paul and Armen—all of them really just came alive with that kind of audience," Manne observed (Henry Manne, interview, April 30, 2014).[79]

In a foreword to a recent reissue of *Capitalism and Freedom*, Appelbaum (2020, p. xvi) devotes a paragraph to Manne's course and concludes: "Manne had succeeded in reeducating fully 40 percent of all sitting federal judges." The *Oxford English Dictionary* notes of the word "reeducation": "From the mid 20th cent.[,] often associated with programs for the internment of political dissidents in some authoritarian societies, esp. communist China and Vietnam." It follows that, unless one believes it appropriate to liken judges' signing up to a short economics

---

[78] In December 1976, the first time the course was offered, it was a five-day program. Friedman participated on this occasion and then made return appearances on April 28, 1978, and April 13, 1979 (Gloria Valentine, personal communication, February 22, 2015). By the time of the 1979 course, the overall program consisted of two weeks of lectures. (See *Fortune*, May 21, 1979, for a news article giving some examples of the course's content in 1979, when other teachers included Martin Feldstein.)

[79] Later, the teachers included Benjamin Klein, Friedman's former student who had become prominent in the law-and-economics field (*Fortune*, May 21, 1979, p. 59).

course to the internment by authoritarian regimes of political prisoners, Appelbaum's use of the term "reeducating" is over the top.

Furthermore, his implication that judges were converted to free-market economics by the course is vulnerable on two other counts: it presumes that the judges were highly pliable, rather than being independent thinkers; and, as Samuelson was a teacher of the course—a fact Appelbaum does not mention—and Samuelson in the 1970s was a defender of both the 1971 wage-price freeze and the decade's maintenance of energy-price controls, the economists with whom Manne launched the course were hardly uniform exponents of a free-market line.

Ash, Chen, and Naidu (2022) argue on the basis of statistical evidence that, in the event, the course did likely have an influence on some of the subsequent judgments made by attendees and on the language they used. The subject matter of the judgments in these cases appears, however, to have been largely in areas like antitrust that were not Friedman's specialty and that were not a major concern of the lectures he gave to the course.[80]

For his own part, Friedman, in his contributions to the course, covered a mixture of his positive-economic analysis and his normative economics. The content of his contributions also consisted of a combination of macroeconomics and microeconomics. The range of material that Friedman covered was reflected in the fact that his final contribution to the course, for a session given on April 13, 1979, titled: "Capitalism, Freedom, and Inflation." (Gloria Valentine, personal communication, February 22, 2015.)

Three years after he had dropped out as one of the teachers of the course, Friedman continued to underline the importance of the course—although he stressed that not only lawyers, but also managers of corporations, needed to become more literate regarding the principles of economics.[81]

Healthcare

In the mid-1970s, Friedman had suggested that it was inevitable that, at some point in the next

[80] Ash, Chen, and Naidu (2022) go further and suggest that Friedman's lectures were notably uninfluential. Their basis for doing so, however, is to take as established fact the unproven—(and undocumented other than via an implausible anecdote)—proposition that Friedman's lectures focused on drug legalization.
[81] Friedman (1982c, p. 58).

decade, the U.S. government would introduce national health insurance (Instructional Dynamics Economics Cassette Tape 152, August 21, 1974). This prediction was not realized. But in the summer of 1979—a period corresponding to the midpoint of the decade to which Friedman had made the prediction—it looked like that development might well eventuate, as the political momentum in favor of national health insurance was stronger than it had ever previously been in the United States.

The buildup of support for a move to universal health insurance, and not any enthusiasm on his part for the measure, had been the basis for Friedman's prediction. Friedman himself was strongly opposed to a federal government universal health insurance scheme. In 1977, he remarked: "There are some strictly public health activities in which the government has been involved for quite some time. I am talking about programs such as the control of epidemics, assuring the quality of water, and measures of this kind that have been in the public domain for over 100 years. So there is something to be said for governmental expenditures in these areas of health care. Also, as long as there are governmental programs to assist the indigent, these inevitably would include assistance to pay healthcare costs. But, beyond these two elements, I believe there is no case whatsoever for governmental financing or involvement in healthcare." (*Federation of Hospitals Review*, April 1977, p. 23.)

In that same year, Friedman indicated that the Carter Administration was likely to try to institute a federal-government-operated, single-payer system. Friedman remarked in May 1977 regarding the then-new president: "He is not a 'conservative' in any way whatsoever, so far as I can see, in the sense of being in favor of a small government. He has come out openly in favor of vast expansions in government power. He has come out in favor of a national health insurance program which would, in my opinion, be a medical as well as a social and financial disaster in the United States." (*The Open Mind*, PBS, May 31, 1977, p. 14 of transcript.)

When President Carter advanced a National Health Plan over two years later, on June 12, 1979, the sensitivity of the issue of medical insurance had been heightened in U.S. political debate by Carter's political prospects in 1980: he was on course to be challenged by Senator Teddy Kennedy in the Democratic primaries. Senator Kennedy had already come out in favor of government-provided universal health insurance, and, indeed, had announced a specific proposal to that effect on May 14, 1979.[82]

---

[82] On the dates of the announcements of each plan, see Hales (1980, p. 347).

In contrast to the Kennedy proposal, the Carter plan did not seek to have government-provided insurance cover all the U.S. population—and so did not actually amount to a national health insurance or single-payer scheme of the kind seen in several other advanced economies. The Carter plan nevertheless sought to move to an outcome in which everyone in the United States possessed health insurance. Carter proposed to secure such universality by mandating that each U.S. firm purchase insurance for their employees—buying the insurance either from private-sector providers or from a new government health-insurance agency (to be called HealthCare). Unlike Kennedy's plan, in which insurance would cover wide-ranging medical expenses, the health insurance that would be made mandatory under the Carter plan pertained only to catastrophic medical contingencies. The Carter proposal was formally submitted to Congress on September 25, 1979, as draft legislation labeled The National Health Care Act. The Kennedy proposal had already been submitted, under the name of The Health Care for All Americans Act, on September 6.[83] Neither of the rival bills became law.

In late 1979, when outlining his disagreements with the Kennedy single-payer proposal in particular, Friedman criticized the record of universal health insurance in other countries.[84] He also professed to see the global trend as being one of moving away from government-provided health insurance. "One of the interesting cases is Australia," Friedman remarked in this connection. "Australia, a few years ago, introduced national health. They have now backed away and terminated it." (*The Register* (Santa Ana, Orange County, California), December 23, 1979, p. E10.)

It turned out, however, that the case of Australia would provide only a limited, and ultimately only an ephemeral, example of a retreat by a country from national health-insurance arrangements. Coming into office in late 1975, Prime Minister Malcolm Fraser had pledged that he would maintain the national health-insurance scheme introduced by the previous Labor government. In the event, over 1976–1979, Fraser did, as Friedman implied in his interview remarks, dismantle aspects of universal health insurance—via steps that involved permitting taxpayers to opt out of the insurance scheme (and the associated income-tax surcharge) and restoring more user-pays elements to health provision. Nevertheless, even in these years, the policy of Fraser's government was that every Australian had to have health insurance of some

---

[83] On these details of the bills and the dates of their submissions to Congress, see Committee on Ways and Means, U.S. House of Representatives, and Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, pp. 1–2, 10–11).
[84] See also his earlier remarks in *Milton Friedman Speaks*, Episode 10, "The Economics of Medical Care," taped May 19, 1978.

kind. It was only in 1981 that something truly close to the abolition of universal medical insurance was instituted by the Fraser Government—via a policy change under which the government continued to cover the medical costs of the elderly and those on low incomes but made no requirement that Australians purchase any insurance—and made no promises to pay the healthcare costs of the population as a whole (*The Age* (Melbourne), April 30, 1981). This more limited insurance regime failed to "take," however. The Labor government that succeeded Fraser's instituted a new universal medical insurance scheme in February 1984, and that scheme (called Medicare) remains in place today.

Friedman's own posture regarding health insurance would also undergo change to a less *laissez-faire* approach. As of the 1970s, his position was that there should be no requirement for U.S. citizens to purchase medical insurance. In addition, although, as indicated above, he was in favor of U.S. government support for low-income citizens' health costs, he believed that there should not be funds earmarked for this purpose. Rather, the support provided by the government should take the generic form of outlays directed to low-income households through a negative-income-tax system (Instructional Dynamics Economics Cassette Tape 102, June 28, 1972; *The Jay Interview*, ITN, July 17, 1976). In contrast, by the early 1990s, Friedman was in favor of a legal requirement that all households purchase catastrophic health insurance (*Wall Street Journal*, November 12, 1991). The 1979 Carter plan, as noted above, had envisioned such mandatory purchases being undertaken by firms on employees' behalf—rather than by American households themselves, as in Friedman's latter-day plan (which is discussed in more detail in Chapter 18 below). Friedman had, nevertheless, made a notable change in his position—a change that aligned him, to a considerable degree, with what the never-implemented National Health Plan of the Carter Administration had advocated.

Productivity

One of Friedman's concerns about the prospect of national health insurance was the likelihood that it would harm U.S. national productivity. Although he conceded that this particular measure was likely only to result in a small reduction in U.S. productivity (*Federation of Hospitals Review*, April 1977, p. 23), such a move would have constituted another of the items diverting the direction of resources from the private sector to the public sector that Friedman believed were in large part responsible for the weakening of U.S. productivity performance in the 1970s.

In early 1979, the scale of the deterioration in the trend of U.S. productivity became recognized to a far greater extent than it had been before. To some degree, the weakening since the 1960s had already been acknowledged, as estimates of potential output growth as high as 4 percent had become uncommon. But estimates above 3 percent remained prevalent until 1979. The productivity softness of the first half of the 1970s had largely been interpreted as a demand rather than a supply phenomenon. Even the 1977-vintage revisions of aggregate supply made by the Council of Economic Advisers and numerous other analysts did not perceive a change in the slope of the path of potential output after 1973. Typically, these estimates merely suggested that potential output was growing more slowly than in the 1960s—or that there may have been a one-time shift down in the level of potential output in the United States and other countries around late 1973.[85] A development that apparently affirmed the validity of this approach in the case of the United States was that, in the initial years of the recovery that began in 1977, the rebound in U.S. aggregate output following its 1975 trough resembled the strong recoveries seen in earlier postwar expansions (see McNees, 1978). In retrospect, however, this development seems to have been a source of false comfort regarding the aggregate-supply picture. The observed expansion of output likely reflected the flexible short-run response of real economic activity to aggregate demand stimulation, rather than true resilience of productivity growth (even though the strength in real GDP was associated, to some degree, with rises in measured productivity).

Data revisions after the 1970s would tend to raise estimates of real output in certain years, but they would not change the basic picture of a disappointing performance with regard to U.S. economic growth over the decade. In 1970, Paul Samuelson had suggested that a 50 percent rise in aggregate U.S. real output could be expected to occur over the decade (Instructional Dynamics Economics Cassette (Paul Samuelson series) Tape 61, October 19, 1970). In contrast, the actual increase from 1969:Q4 to 1979:Q4, according to modern data on U.S. real GDP, was slightly under 38 percent.

By 1979, the evidence already available was confirming the reality of a step-down in the growth rates of productivity and output—and not just a one-time downward shift in their levels. Signs of a lasting post-1973 slowdown in productivity became more evident during 1978. Although Blinder (1979, p. 64) would emphasize that in the 1975:Q4−1977:Q4 period, "productivity growth was almost exactly equal to its 1967−1973 average," data for the year 1977, considered

[85] See, for example, Artus (1977) and Wonnacott and Wonnacott (1979, p. 334). At this stage, the CEA accepted that U.S. productivity growth had moved down around 1967 but recognized no step-down during the 1970s. See Orphanides (2003, p. 656).

in isolation, would point toward likely weakness in productivity growth.[86] Although he recognized this fact, CEA Chairman Charles Schultze initially remained optimistic, stating in a memorandum in mid-1978 with regard to weak productivity growth in the year to 1978:Q2: "We have not been able to explain it, but [we] see no reason to assume that this very bad experience will persist."[87] Subsequently, however, data released in January 1979 registered productivity growth of 0.4 percent for 1978, the lowest reading since 1974 (*San Jose Mercury* (California), January 27, 1979; Carruth, 1993, p. 733). Although, as noted in the previous chapter, this weak 1978 productivity number would be revised up to a much stronger value, the revisions largely reshuffled the poor productivity data points to the years adjacent to 1978, rather than eliminating the evidence of sustained weakness. Even in retrospect, therefore, it is clear that the Carter Administration was on solid ground when, in January 1979, it substantially revised down its estimate of the post-1973 growth in underlying productivity. This reassessment put post-1973 potential output growth at 3 percent, down from the previous estimate of 3.5 percent (*Citibank Monthly Economic Letter,* February 1979, p. 1).

It is against this background of a basic reassessment of productivity trend that Friedman declared with regard to the rise in output since 1975: "this has been a kind of joyless expansion" (*Chicago Tribune,* July 15, 1979). By this, he meant that the recovery, although associated with increases in employment, had seen little growth in per capita output or living standards. "I doubt that there has been any expansion in the postwar period which has been as weak in terms of productivity," Friedman observed (*Chicago Tribune,* July 15, 1979). He would be comfortable about an outcome of little or no growth per capita, he told Phil Donahue a couple of months later, if that outcome emerged from a concerted decision by the private sector, on the average, that it was satisfied with its existing level of income and was, consequently, now unwilling to devote resources, in aggregate, in pursuit of improvements in U.S. productivity. But this scenario did not, in fact, describe the process by which low productivity growth had come about in the United States. Rather, the country still had the characteristic that "we have a desperate *desire* to grow," and such growth was, in Friedman's view, being impeded by increasing government intervention in the economy (*Donahue*, NBC, September 6, 1979).

The longer-term policy agenda, as far as Friedman was concerned, should be to bring the country's productivity growth back up, by increasing the role assigned in the U.S. economy to market mechanisms. For the moment, however, he accepted as a fact the decline in the post-

[86] See DeMilner (1978, p. 528), Miller (1978c), and Section I of the previous chapter.
[87] Quoted in Biven (2002, p. 201).

1973 productivity trend embedded in the official 1979 revision of potential output. This revision had a bearing on his own prescription for monetary policy, as Friedman's monetary-growth recommendation required an estimate of potential-output growth. Although he had been outspoken before 1979 on the likelihood that the natural rate of unemployment had risen in the United States, Friedman had, until this point, not really concentrated attention on the possibility that the growth rate of potential output had declined. Indeed, in 1978, in giving 4 percent as his recommended long-run growth rate for the M2 aggregate, Friedman was using a number that apparently stemmed from a stationary-velocity assumption alongside an assumed potential output growth rate of about 4 percent—higher than the 3.5 percent espoused by the CEA at the time (*Newsweek*, July 24, 1978).[88]

After 1978, however, Friedman more fully absorbed the post-1973 decline in potential growth. This change in his thinking was evident in the contrast between his 1976 remark with regard to the prospect of 4 percent output growth that year—"It wouldn't be a vigorous expansion" (Instructional Dynamics Economics Cassette Tape 188, March 1976, Part 2)—and his 1986 reference to "a vigorous 3.8 percent" growth (*Wall Street Journal,* September 18, 1986). Indeed, Friedman evidently accepted the new official estimates of potential growth quite rapidly. Soon after those new estimates were issued, Friedman was giving potential growth as 3 percent or 3 to 3.5 percent (*San Jose Mercury* (California), February 11, 1979) and, by midyear, he had incorporated the administration's 3 percent potential-growth number into his monetary policy recommendations: The Federal Reserve, he said in June, should get M2 growth down by 1 percentage point per year until it reached 3 percent, then keep it there. "I guarantee that will bring inflation to zero," Friedman said, adding: "If that's wrong, I've wasted a lot of years of my life." (*American Banker*, June 12, 1979, p. 3.)[89]

The Soviet Union's economy reconsidered

Although the productivity slowdown of the 1970s was only really being recognized in the closing years of the decade, it was not, of course, new for U.S. economic-policy discourse to lay great stress on the need for improvements in national productivity and to secure a higher long-

[88] He had earlier, however, indicated his agreement with the lowering of estimates of potential output growth to 3.5 percent (Instructional Dynamics Economics Cassette Tape 208, February 1977, Part 1).
[89] On *Wall Street Week* (Maryland Public Television, January 4, 1980, p. 12 of transcript), Friedman reverted to giving "about 4 percent" for his preferred ultimate M2 growth rate and so presumable his estimate of long-run potential growth. But this was probably a slip: On other occasions in the first half of the 1980s (for example, Friedman, 1984a, p. 58), he was explicitly giving an assumed value for potential real output growth of 3 percent.

term economic growth rate. Calls to bring up the United States' rate of economic growth had been very prominent, for example, in debates on economic policy in the late 1950s.[90] But one notable difference between that era and the discussions of U.S. productivity during 1979 was the weight placed on the economic performance of the Soviet Union. In contrast to the late 1950s, during 1979 the postwar economic-growth record of the USSR was no longer being cited as a motivation for the United States to up its game or as an economic threat to the nation.

The different outlook toward the USSR by 1979 was reflected in remarks made in the middle of the year by former Under Secretary of State George W. Ball: "The Soviet Union today is faced with terrible problems that make even the problems that preoccupy us look rather simple. They have an economy which simply is not working, and in the nature of things I do not think can be made to work."[91]

Observations such as Ball's reflected the fact that, in the course of the 1970s, there had been a coming of age among watchers of the USSR. The view, so prevalent in the 1950s, that the Soviet Union was a serious economic competitor *vis a vis* the USA had been decisively banished. The chronically poor state of the Soviet economy was recognized not only by longtime analysts of the Soviet economy who were outside government in 1979 but also by current U.S. government officials. For example, in testimony to the U.S. Senate's Committee on Armed Services during January 1979, General David Jones, Chairman of the Joint Chiefs of Staff, made what was by then an uncontroversial statement of fact: "The Soviets have some very severe problems. They are clearly not an economic superpower."[92]

The position expounded in the 1950s and 1960s by Friedman in articles and talks, and by his student Warren Nutter in much research—that the Soviet command economy was fundamentally weak—was, therefore, very commonly held in the United States and in the wider Western world by the end of the 1970s. Reflecting this change, the Friedmans, when writing the book version of *Free To Choose*, had no reason to refer to Soviet economic performance as other than an example of the negative results that could be expected to result from large-scale preemption by the government of market mechanisms.

Nutter himself did not live to see the full extent to which his and Friedman's position on the

[92] From Jones' testimony of January 25, 1979, in Committee on Armed Services, U.S. Senate (1979, p. 35)

USSR economy had been borne out in U.S. discussions by the end of the 1970s. He died of cancer on January 15, 1979, ten days before the testimony by General Jones quoted above (*New York Times*, January 16, 1979).

Return to double-digit inflation

One of the prominent fears expressed in U.S. public debate in the late 1950s—of being superseded economically by the Soviet Union—had therefore proved groundless, and twenty years later it had been completely discarded. But one could not say the same thing about another fear prevalent in that late-Fifties era: of an impending eruption of inflation. The fear was indeed overplayed in 1958–1959, and, to Friedman's dismay, prompted what was likely an unsound monetary policy tightening in that period, as the Federal Reserve based its actions on a misguided assessment of the amount of inflationary momentum present in the U.S. economy. But, by the late 1970s, the United States had experienced the reality for several years of high inflation—and at rates generally far in excess of those that had been merely feared in the late 1950s.

Furthermore, over 1979, the inflation problem got considerably worse. Federal Reserve chairman Miller had remarked on October 3, 1978: "I don't accept the idea that we have an underlying inflation rate of seven to eight percent. That is our current inflation rate, but I believe that the trend and the actions that have already been taken will begin to bring that down." After stressing recent movements in the exchange rate and in domestic costs as forces responsible for the current rate of inflation, Miller pointed to "the prospects for reducing inflation by 1 to 2 percent next year [that is, 1979]."[93] In contrast, Friedman's prediction about 1979's inflation rate, made in a television appearance the following month, went in the opposite direction: "inflation will get over 10 percent next year."[94] Incoming inflation data soon vindicated this prediction and confounded Miller's.

The twelve-month percentage change in the consumer price index had already reached 9 percent in December 1978. As reports at the time stressed, 9 percent rate amounted to the second-worst rate with which the United States had closed any year since 1947—being behind only the December 1974 reading (*Financial Times* (London), January 25, 1979) The Associated Press report on the day of the CPI announcement tried to put things in a somewhat positive light: "the

[93] In American Productivity Center (1978, p. 33).
[94] *Meet the Press*, NBC, November 12, 1978, p. 9 of transcript.

inflation picture improved in the last two months of the year," it observed, while adding: "The administration is predicting a 7.4 percent rate for 1979." (*Kansas City Star* (Missouri), January 24, 1979.) But inflation proceeded to get much worse in 1979. On a twelve-month basis, CPI inflation rose above 10 percent in March 1979. It had teetered on the brink of 10 percent in the February figures, which had had a twelve-month increase of 9.9 percent. "Look in the sky, it's 15% inflation!," one headline had read upon the release of the February CPI data (*Daily News* (New York), March 24, 1979). That 15 percent figure had been arrived at by a procedure Friedman usually deplored—of taking a one-month increase in the CPI and annualizing it—in this case, to reach 15.4 percent.[95] But the procedure did legitimately communicate the fact that the late-1978 slowing in monthly rates of price increase had been ephemeral. Buoyed by such high rates of monthly increase, the twelve-month CPI inflation rate stayed above 10 percent after March 1979, and it closed the year at 13.3 percent, a new post-1946 high for the end-of-year inflation rate (*The Oshkosh Northwestern* (Wisconsin), January 25, 1980; *The Sun* (Baltimore), January 26, 1980).

Inflation had already reached nearly 12 percent when Charles H. Brunie, a friend of Friedman's who employed him as a consultant to his asset-management firm Oppenheimer and Company, was moved to join a debate being played out in the pages of the *Wall Street Journal*. Brunie wrote that "it was particularly disturbing to read [econometric modeler] Michael Evans' comment (Letters, Aug. 30 [1979]) that no one correctly forecast inflation for 1978 and 1979. He's wrong, because Milton Friedman did." As well as recalling forecasts that Friedman had made in 1976 and 1977 of double-digit inflation at decade's end, Brunie quoted Friedman saying in mid-1978 that "it would be a miracle if inflation peaked below 10 percent, and 10−12 percent or 10−13 percent would be more likely." (*Wall Street Journal*, October 1, 1979.)

Recognition of the modern inflation epoch

The revival of U.S. inflation, after its mid-decade decline, to a new postwar peak in 1979 meant that the label Walter Heller had attached in 1976 to the experience so far—"The Great Inflation

[95] Expression of monthly or quarterly rates of change in annualized form was a much more prevalent practice in U.S. economic discussion than it was, at this point, elsewhere. Friedman had expressed reservations about what he called "the newspaper discussion of prices" in which "everybody rapidly multiplies [a newly released monthly increase] by twelve" (Friedman, 1971h, p. 9), though, of course, he occasionally engaged in similar practices himself. Paul Samuelson, in the same vein, had referred to the "foolish people who multiply a one-month figure by twelve" (Instructional Dynamics Economics Cassette (Paul Samuelson series) Tape 136, September 6, 1973; see also Tape 119, January 12, 1973, in the same series).

of the 1970s"—proved to be a more than apt description of the whole decade's experience. Friedman had foreshadowed this eventuality in February 1974 when he remarked in a talk at Harding College, Arkansas, that a "Great Inflation," not a Great Depression, was what the United States would likely face in the years ahead (*Arkansas Democrat* (Little Rock), February 22, 1974).

Walter Heller would reuse the term "The Great Inflation of the 1970s" in an early 1979 piece he wrote with George Perry for a bank newsletter in Heller's home city of Minneapolis (*Minneapolis Tribune*, January 19, 1979). Others, too, were likewise thinking of the 1970s period as reflective of a new epoch. But whereas Heller, Perry, and other Keynesians were inclined to think of the new situation as mainly reflecting a greater tendency for inflation to have momentum of its own separate from the settings of aggregate-demand policy. Friedman, in contrast, was inclined to view the United States' recurrent high inflation in terms of a change in the nation's monetary policy to a different regime during the 1960s and 1970s.

One of the ways in which Friedman looked at the modern policy regime was via the perspective of time-series analysis. Here, he drew particularly on work published in the middle of the decade by his former student Benjamin Klein, who had regarded the United States as having in effect adopted in recent decades "a new monetary standard" (Klein, 1975a). In documenting this point, Klein (1975b) had focused on the univariate time-series properties of U.S. inflation in different historical periods—including a post-Korean War sample that included the years of rising inflation after 1964 and that culminated in the major breakout year of 1973.

The rise in inflation in the 1964–1973 decade, together with the inflation observations recorded for the years of the 1970s beyond Klein's sample, forced a rethinking of the basic time-series properties of U.S. prices and inflation. For one thing, a fact already discernible on the basis of the data for the 1950s and 1960s was now irrefutably clear: the price level was clearly nonstationary. The gentle price rise of the price level in the decade following the Korean War, together with the more rapid pace of increase since the 1960s, already constituted sizable evidence against the presumption that the price level was stationary. Remnants of the notion that there was some mean-reverting tendency in the price level (or, more plausibly, a reversion to a mild linear trend), were, however, [present in some of Friedman's commentary and research in the late 1950s and even into the late 1960s (see Nelson, 2020a, Chapter 10). But, by the mid-1970s, he had been disabused of that notion. In June 1976, for example, Friedman observed that, in contrast to past eras, "there's no relationship between the price level and the interest rate," and

in particular, "the price level in the United States is something like 60 percent or 70 percent above where it was in 1969," and short-term nominal interest rates were not.[96] By 1979, the manifest nonstationarity of the price level had seeped so much into U.S. discussion that it was mentioned in fictional television programs. When a character in the network drama series *Eight Is Enough*, Nancy Bradford, was employed in the financial markets, one of her lines of dialogue in an episode broadcast in November 1979: "Inflation has caused the average price level to more than double in the last ten years."[97]

In the period with which Klein was concerned, and even more so in other research completed by 1979, the key question about univariate U.S. inflation dynamics had, instead, become whether even the inflation rate itself was stationary. On the basis of estimation using a sample ending in July 1971, C. Nelson and Schwert (1977, p. 481) had conjectured that it was not, stating had argued that "the autocorrelation structure of the CPI monthly inflation series… suggests that the series may reasonably be represented as a first-order moving average process in its first differences, implying nonstationary behavior in the rate of inflation." As high-inflation observations accumulated in the United States over the 1970s, the case for representing inflation as an I(1) (nonstationary in levels) time series, such as a random walk or some other form of ARIMA (autoregressive integrated moving average) process, built up. Klein (1975b, pp. 134−135), using annual data, found that the random walk was a good approximation of annual inflation dynamics in the 1956–1973 period. The actual first-order correlation that he reported for inflation (0.75) indicated, however, that, as yet, the basis for treating inflation as stationary remained quite sound. That basis eroded as data for 1973−1979 were recorded. McCallum (1994, p. 235), for example, showed that the sum of coefficients in an autoregressive representation for post-Korean War quarterly inflation was only once above 0.75 in successive sample periods ending each year from 1966 to 1972, but that the sum was consistently above 0.85 on samples ending in any year from 1973 to 1980.

By the end of the 1970s, advances in time series analysis allowed much more formal means of testing whether a series was nonstationary (specifically, an I(1) series that was stationary in its first differences) was available in the work of Fuller (1976) and Dickey and Fuller (1979). It would turn out that results obtained using these formal tests also implied that a random walk, or

[96] Friedman (1976i, p. 9).
[97] *Eight Is Enough*, ABC, November 21, 1979. This line of dialogue reflected a minor, and accurate, element of forecasting on the part of the program's scriptwriters. The statement that the price level had more than doubled in the past ten years was not quite true in the spring-summer 1979 period during which the program was likely filmed. But it had become true by the time of broadcast.

perhaps an augmentation of this difference-stationary representation to allow for multiple lags in the autoregressive specification of inflation, was a good approximation of the U.S. inflation process.[98]

In *Monetary Trends*, published in 1982, Friedman and Schwartz remarked of the modern U.S. regime: "There is no widespread anticipation that the price level will revert to any 'normal' level; it (or perhaps its derivative) is now nearly of the nature of a random walk, perhaps with drift."[99] The hypothesis embedded in the latter part of this statement—that postwar U.S. inflation might be a random walk and, even more so, the additional stipulation that it was a random walk *with drift* (the drift, in this instance, being positive—that is, an upward trend)—was not really very well established at the time, in 1979−1980, when Friedman and Schwartz wrote the quoted words.[100] They were making their description of the time-series properties of U.S. inflation largely on the basis of Klein's 1975 work, possibly combined with perhaps Friedman's empirical generalization that U.S. inflation's successive peaks and troughs had been progressively higher in each inflation "cycle" since 1960 (see, for example, Instructional Dynamics Economics Cassette Tape 204, December 1976, Part 1). But they were not making their statement on the basis of econometric analysis of the late-1970s U.S. inflation data, and they certainly had arrived at it on the basis of the formal statistical tests emerging in the recent literature.

Notwithstanding the tentative foundations for Friedman and Schwartz's statement, it would prove prescient, once the data for the late 1970s and for 1980 reinforced and confirmed the evidence of a random-walk inflation series. And this was even more so once econometric research such as Shapiro and Watson (1988, pp. 122−123) and King, Plosser, Stock, and Watson (1991, p. 825), making use of the Dickey-Fuller statistical tests, had suggested that U.S. inflation might well be difference-stationary (and possibly, on samples ending around 1980, also had drift—a positive mean on the dimension of its first difference) rather than itself being covariance stationary.

---

[98] The use of the Dickey-Fuller tests in macroeconomics had been pioneered by C. Nelson and Plosser (1982). The research for this 1982 study started in 1979, when the authors received a National Science Foundation grant for the underlying project (see C. Nelson and Plosser, 1982, p. 139). A working-paper version of the paper was issued in August 1980 (see Darby, 1983, p. 476). Nelson and Plosser's sample period ended in 1970 and, unlike later authors, they did not consider the post-World War II period in isolation or test for the stationarity of inflation (as distinct from the log price level).

[99] Friedman and Schwartz (1982, p. 570).

[100] Friedman and Schwartz were, however, not correct in implying that it was only "possibly" the case that the random-walk behavior of the (log) price level had a drift component.

Warning of recession

For Friedman, the move of inflation into double digits, 1979 provided further confirmation that U.S. monetary policy in prior years had been too loose. The *current* stance of monetary policy, however, was another matter. In his first *Newsweek* column for monetary policy in early 1979, titled "The Fed: At It Again" (February 19, 1979), Friedman's criticism of the Federal Reserve centered on the indictment that its stance was now, in fact, too tight.

The Federal Reserve tightening that had occurred during 1978 had led, by the end of the year, to a major shift down in the annualized rates of growth of M2 in the low single digits. At one time, Milton Friedman would have been angry or mystified in the face of a severe lurch of this kind. By early 1979, however, he was accustomed to such swings, even in an era in which the Federal Reserve paid increased attention to monetary growth.

And so it was with a tone of world-weariness that Friedman prefaced his column's analysis. Friedman began by noting that his monetary policy commentaries in *Newsweek* had had "a cyclical pattern." They had predominantly consisted of taking the Federal Reserve to task for policies that produced excessive monetary growth. But, he added, in the remainder of the time, the Federal Reserve did exercise restraint, only to go too far in that direction and raise the risk of an unnecessarily severe recession. On these latter occasions, "I find myself criticizing the Fed for increasing the quantity of money too slowly." The time had arrived, Friedman explained, for him to shift to that line of criticism once more.

What had prompted this commentary was a decline in M2 growth from its double-digit average rate before 1978 to what Friedman reported as a 3.3 percent annualized rate since September 1978.[101] The latter rate, Friedman said, "is fine as an ultimate target."[102] But the Federal Reserve's tightening had, in the last few months of 1978, moved M2 growth so quickly to this

[101] On quarterly and somewhat revised data, the weakness in M2 would mainly be recorded somewhat later—occurring in the first quarter of 1979. In particular, the tabulations in Simpson (1980, p. 113) showed that weakness in monetary growth was less pronounced but visible for the modern definition of M2 than for the old definition of M2 (which was still the official series in early 1979). The modern M2 series has annualized growth of 6 percent in 1979:Q1—above the annualized rate that Friedman reported for old M2 for late 1978/early 1979, but lower than in any quarter since 1974.
[102] *Newsweek*, February 19, 1979. Friedman's endorsement of 3 percent (rather than 4 percent) as the appropriate long-run rate of M2 growth was, apparently, an early sign of his acceptance of the changes made in early 1979 to the official estimate of potential output growth. These revisions, made by the Carter Administration, were discussed above.

low rate that Friedman felt that a U.S. recession was now a serious danger. "They haven't been doing it gradually; they've been hitting us over the head with a blunt hammer," he observed in an interview, given in early February at his office at the Hoover Institution, that appeared at the same time as the column (*San Jose Mercury News* (California), February 13, 1979).
"*Goodbye M1*"?

Although Friedman had based his discussion entirely on M2 behavior, the more widely-watched M1 aggregate seemed to corroborate his diagnosis of a shift toward stringent monetary conditions. Indeed, M1, as defined as the time, registered an absolute decline in the early months of 1979 (*Financial Times* (London), August 6, 1979; Simpson, 1980, p. 112). Friedman, however, did not cite M1 behavior in support of the judgment concerning monetary conditions that he expressed in the February 1979 *Newsweek* column. Instead, he discounted M1's signal completely.

Friedman's basis for doing so was closely related to a factor that would be highly relevant for the analysis of M1 for the decades after the 1970s. In late 1978, federal banking regulators considerably relaxed the conditions under which commercial banks could allow no-penalty transfers of their customers' deposit balances from interest-earning time deposits (included in M2 alone) when a top-up was needed of the same customers' noninterest-bearing demand accounts, which were included in M1 (see Cagan, 1979, p. 123). For Friedman, the change meant that the demand-deposit/time-deposit distinction was more tenuous than it had been at any point since the 1930s. The exclusion of time deposits from the definition of money, and the consequent focus on M1 rather than M2 in monetary analysis, constituted a practice that he and Schwartz had already largely eschewed in their coauthored work. But in 1978–1979 Friedman further argued that the late-1978 institutional change should make U.S. monetary analysts, who tended to favor M1, focus squarely on M2 (*Newsweek*, October 30, 1978, see also *Newsweek*, February 19, 1979). M1 would be a "nearly useless aggregate" from now on, Friedman declared, and his column discussing the regulatory change included a subtitle "GOODBYE M1" (*Newsweek*, October 30, 1978).

This drastic conclusion would be tempered, however, over the course of 1979. Legal challenges, launched by thrift institutions, to the 1978 regulatory changes put a brake, for the moment, on commercial banks' scope to routinize the conversion of demand deposits into time deposits (*Kansas City Star* (Missouri), April 28, 1979; Cagan, 1979, p. 123).

Furthermore, the reliability of M1 would be bolstered somewhat by the Federal Reserve's broadening of the definition of M1 in 1979−1980, discussed in a later chapter. This redefinition removed one major source of outflows from M1 in the late 1970s: the shift out of commercial bank demand deposits into the essentially checkable accounts—Negotiable Order of Withdrawal (NOW) accounts—that had increasingly been offered by thrift institutions during the 1970s. With NOWs included in the revised definition, the decline in M1 registered in early 1979 was not a feature of the revised series, and M1 behavior became closer to that of M2 for that period.[103]

The fact that the change in M1 definition brought M1 and M2 into better alignment also suggests that, in 1978 and 1979, Friedman may have overestimated the role of banks' automatic transfer services as a factor distorting incoming M1 data in that period. Because the M1 redefinition eliminated some of the more anomalous swings recorded in incoming M1 data over 1978 and 1979, it is likely that the main culprit driving these swings did not consist of the automatic-transfer services—which shifted funds across bank-deposit classes but kept those funds in the commercial banking system—but the growing popularity of NOW accounts, which were outside the old definitions of both M1 and M2 and amounted to nonbank depository institutions' liabilities. But the day would come when automatic transfers were a very important factor indeed making for distortions in the M1 series, even in its modern definition. Automatic transfers continued to be practiced in some form by commercial banks from 1979 onward, but in that year, and into the 1980s, they largely consisted of services provided to large-balance customers and were predominantly transfers from retail-deposit accounts to wholesale-deposit accounts.[104] The effects of these practices on the behavior of M1 and M2, though not negligible, were limited in this era.

In the 1990s, however, automatic transfers, known as "sweeps," became prevalent on a large scale as a means by which commercial banks handled their retail customers' accounts, including non-business customers, and would be used by banks to re-weight their deposit liabilities away from demand deposits (which remained, at that time, subject to reserve requirements) and toward time deposits (which were free of reserve requirements starting in 1991). "Sweeps," or automatic transfers, would indeed come to dominate and distort M1 behavior in the 1990s and

---

[103] See Simpson (1980, pp. 112−113).

[104] For their high-balance customers, commercial banks around 1979 were showing a tendency to make automatic transfers of demand deposits to interest-earning accounts, in this case shifting the funds to wholesale instruments like bank-issued repurchase agreements and Eurodollar accounts. See Whitesell and Collins (1996, p. 2).

beyond (R.G. Anderson, 1995; Cynamon, Dutkowsky, and Jones, 2006). These would eventually make M2 a clearly preferable measure of money to M1. This outcome was just as Friedman had anticipated in 1978–1979, but much further in the future than he had thought.

In any event, it was on M2 that Friedman focused squarely in making his judgment that the FOMC had tightened too much. In his *Newsweek* column, he left open the possibility that recession could be avoided: he hoped that the period of M2 growth would not last "too long" and that the Federal Reserve "promptly end its overrestrictive policy" (*Newsweek*, February 19, 1979). In his press interview given around the same time, however, Friedman was more categorical about what would flow from the policy actions already taken. "We're going to have a recession [in] the middle of this year," he remarked (*San Jose Mercury News* (California), February 13, 1979).

The U.S. Department of Commerce indicated its own vote of confidence in M2 when, effective starting March 1979, it replaced real M1 with real M2 in the Index of Leading Indicators that it reported each month (Laurent, 1993, p. 11). The overall readings of the index during this period supported Friedman's warning of a recession. Arthur Burns was not impressed by the signal, telling a reporter that the index of leading indicators was "a very poor index right now" as it was "heavily influenced by the money supply statistics, which should never have been in it." (*Newsweek*, May 14, 1979.)[105]

Intramural disputes among monetarists

More surprisingly, Friedman's assessment of early-1979 monetary conditions was disputed by fellow monetarists. The picture of restriction that M1 and M2 alike provided in this period did not prevent a public flare-up among monetarists about judging policy stance. The reason for the different judgments was found in the behavior of the monetary base. The base continued to grow strongly into the new year, and the Shadow Open Market Committee (SOMC), whose members included Karl Brunner, Allan Meltzer, and Anna Schwartz, saw base growth as providing, at this time, the best indication of monetary growth among the various aggregates. Indeed, in late November 1978, Brunner had argued that it might be preferable to conduct aggregate monetary

---

[105] As mentioned in Chapter 5, money was added to the index in 1975. The 1979 replacement of M1 in the M2 in the index may have been partially influenced by Friedman's warnings that automatic transfers would critically distort the behavior of M1 starting in late 1978. Real M2 remained one of the twelve series in the index of leading indicators (which, in more recent years, has been collected by the Conference Board) until 2011.

analysis from this point on in terms of the base, especially until the definitions of broader monetary series were improved to handle recent financial innovations.[106]

In light of the behavior of the base up to January 1979, Brunner rejected Friedman's suggestion that monetary policy had lurched into tightness. Striking public dissent from Friedman's analysis came from Anna Schwartz, who sided with her SOMC colleagues on the dispute and was quoted in the business press saying: "We think Milton overreacted." (*Business Week*, April 2, 1979, p. 17.)

Friedman stuck to his position as generally weak data on monetary growth continued to come in during the first half of 1979. Monetary growth "has slowed to such an extent that even Milton Friedman has called for some monetary relaxation," it was observed in spring (*Investor's Chronicle* (London), May 4, 1979), and in June 1979 Friedman told a meeting in Washington, D.C., of the National Federation of Independent Business: "We are, at the moment, poised on the edge of a recession." (*American Banker*, June 12, 1979, p. 3.)

As Friedman's position hardened, the disagreement with other monetarists receded somewhat. Monetary base growth came closer into line with M2 growth, and Karl Brunner would view the six months to April 1979 as one characterized by restrained base growth (see Brunner, 1980b, p. 18). By mid-1979, both Brunner and Allan Meltzer took the position that monetary policy had indeed become appreciably more restrictive, even though they did not share Friedman's assessment of the sheer magnitude of the tightening in the past nine months (*Wall Street Journal*, June 19, 1979).

G. William Miller and the recession warnings

Federal Reserve Chairman Miller was long familiar with Friedman's warnings of recession by this point. In February, after Friedman's *Newsweek* column appeared, Senator Orrin Hatch (R–UT) had used it as the basis for written questions to Miller. Senator Hatch stated:

---

[106] See Brunner (1979, p. 38). Brunner here (as well as elsewhere: see Nelson, 2019, for a discussion) argued that the base, as a series that and excluded commercial bank deposit liabilities and (at this time) had no interest-bearing components, was insulated from financial innovations that bore on bank deposit liabilities, such as switches between demand deposits and time deposits and changes in arrangements concerning the payment of interest on various classes of bank deposits. This was an argument for which Friedman had shown some sympathy: see Chapter 8 above.

> Many economic observers, although pleased that the Federal Reserve has decided to restrain the growth of the money supply, are concerned that the Fed is reducing the rate of money growth too rapidly. Milton Friedman, one of the few economists to foresee our present accelerating inflation and predict last year's high inflation rate, has become critical of the Fed for reducing money supply growth too drastically. He argues that the Fed is putting us back on the roller coaster of inflation, recession, and more inflation.[107]

Miller made no reference to Friedman in his reply and cast doubt on the significance of the money data (including M2) before concluding: "The Federal Reserve believes that the deceleration implied by its current longer-run growth ranges for the monetary aggregates is consistent with the avoidance of recession."[108]

As he was making this observation, Miller was entering the most controversial period of his time as chair of the Federal Reserve. This was the brief, but much-remembered, time in spring 1979 when Miller led the Federal Open Market Committee majority vote against proceeding with rapid increases in the federal funds rate.[109] In doing so, Miller resisted pressure coming from the Carter administration to expedite tightening, presided during couple of dissenting votes by his deputy on the FOMC, Paul Volcker, and greatly fostered criticism of his leadership and judgment in financial and media commentary.

As it happened, however, Miller's posture during this episode was broadly consistent with Friedman's judgment that U.S. monetary policy had already tightened too rapidly and that steps to retrace tightening (which, in terms of interest-rate policy, might mean a pause on rate increases) were warranted. Indeed, *Business Week* implied that Miller might have been paying more attention to Friedman's warnings than Miller's public statements were acknowledging. In trying to bolster monetary growth in the spring of 1979 in order to avoid recession, the magazine commented, "he is behaving like a monetarist economist who sleeps with *A Monetary History of the United States* under his pillow." (*Business Week*, May 7, 1979, p. 24.) This characterization, of course, overdid Miller's alignment with the monetarist position. But Miller did seem to share with Friedman the contention that holding back on further tightening moves might be more consistent with the stated policy aim of an economic slowdown, but not a recession, during 1979.

[107] In Committee on the Budget, U.S. Senate (1979, pp. 204–205).
[108] In Committee on the Budget, U.S. Senate (1979, p. 205).
[109] See the discussion titled "Paul Volcker" in Section III below.

Such a slowdown, in turn, was viewed as a desirable development. This was especially the case in light of the Carter Administration's 1979 revisions, already discussed, to potential output. These revisions heightened the likelihood that aggregate output was poised to overshoot its full-employment value and reinforced the need to moderate economic expansion for the time being. Chairman Miller frankly described the current policy strategy when, during an appearance in St. Louis in mid-June 1979, he observed that monetary restraint was being applied "to reduce the real rate of growth of the economy" for disinflationary purposes (quoted in *St. Louis Globe-Democrat*, June 15, 1979).

As it happened, the U.S. economy did avoid a recession in 1979. Explaining why this had happened, Friedman would cite the fact that monetary growth picked up after the first quarter of 1979, allowing an outcome in which "instead of a continued recession that everyone had been forecasting, the economy turned around" (*Business Week*, May 12, 1980, p. 16).[110] This would, however, prove to be only a narrow, and short-lived, escape: the U.S. economy entered recession very soon after calendar 1979, reaching its cyclical peak in January 1980. By then, Friedman's fears of recession had become widely shared. The position that the U.S. economy would avoid a recession altogether had been held at the official level—by the Federal Reserve Board and the Carter Administration—in the first half of 1979. But that expectation had then been widely revised inside and outside officialdom, in light of two dramatic further events, discussed in the next two sections: the tightening of monetary policy under Miller's successor Paul Volcker; and the second oil shock.

II. ISSUES AND ACTIVITIES, 1979

THE SECOND OIL SHOCK

Friedman would have occasion to refer to "the fall of the shah in 1978" (*Newsweek*, September 15, 1980) when discussing the role that events in Iran had played in shaping the course of oil prices in 1979.[111] His dating was not precisely correct. Although the revolution in Iran was very much underway during late 1978, the shah did not leave Iran—in effect, conceding his loss of office—until January 16, 1979, with Ayatollah Khomeini then returning to the country in

---

[110] Friedman's reference to a "continued" recession here apparently was a reference to the weak real output growth in the first half of 1979. Initial estimates of second-quarter 1979 economic growth were negative (*Financial Times* (London), August 6, 1979). And even the modern, revised real GDP data record growth in the first half of 1979 as very low: increases of 0.7 percent and 0.4 percent at annual rates in 1979:Q1 and 1979:Q2, respectively.
[111] He would reuse this phrase in *Newsweek*, March 21, 1983.

February 1979, in order to take power (Cook, 1979, p. A45). Nonetheless, Friedman's basic position—that the Iranian revolution would give rise to oil price "levels that only a few years earlier would have been regarded as impossible" (*Newsweek*, March 21, 1983)—was sound. By the end of 1979, OPEC had ratified what was, in essence, a doubling of the world oil price—a doubling that was applied to the already high level established by events earlier in the decade.

The extent to which developments in Iran came as a surprise to the outside world was underlined by the fact that it was not until January 3, 1979, that the U.K. government officially canceled a visit to Iran by the Queen that had been scheduled to take place during the year (Cook, 1979, p. A45). Likewise, John F. O'Leary, the Deputy Secretary of the Department of Energy, observed "I did not predict Iran," when he was asked, in May 1979, to explain why the U.S. government had, until recently, been predicating its policies on an assumption of unchanged or declining real oil prices.[112] Friedman himself would give the fact that "I did not foresee the revolution in Iran" (*Newsweek*, March 21, 1983) as the reason why his longstanding prediction of a major decline in oil prices was not finally realized at the end of the 1970s.

Instead, oil prices exhibited a strong pickup over the course of 1979. The first couple of months of the year saw what O'Leary referred to as the "Iranian outage"—major interruptions of production of oil and large-scale suspension of exports of oil in Iran during the revolution period and its immediate aftermath.[113] Before the revolution, Iran produced about 6.5 million barrels of oil per day and exported about 5.5 million of it, and, of this, about 900,000 barrels went to the United States (*Rockford Register Star* (Illinois), February 15, 1979*a*, p. A10). The period of revolution was accompanied by a large decline in production and, in particular, a dearth of oil for export, implying what Friedman called a "near-cessation in the flow of oil from Iran" (*Newsweek*, March 21, 1983).

Reflecting the revolution and actions by OPEC as a whole, the world oil price registered a major increase. OPEC had already announced, in mid-December 1978, a planned rise in the oil price of 14.5 percent to be implemented over the course of 1979 (Federal Reserve Board, 1979, p. 202). This decision showed up in an oil-price increase early in the year—to $13.34 per barrel at

---

[112] From O'Leary's testimony of May 16, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 191). On his reference to pre-1979 declines in real oil prices, see page 190 of O'Leary's testimony, in which he had cited a 20 percent decline in the world market's real price of oil in 1977–1978. Friedman would likewise cite the real price decline in the world oil price of "about 25 percent" from 1974 to 1978 (*Newsweek*, September 15, 1980).

[113] From O'Leary's testimony of May 16, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 190).

the end of March 1979. By mid-year, however, the increase in oil prices had become sharper than envisioned by OPEC the previous December, with the world price standing at $14.54 (International Monetary Fund, 1981b, p. 145). And OPEC had a meeting scheduled for late June for a further reevaluation of its pricing policy.

And, because, even under the regime of controls on prices of American oil production, U.S. petroleum prices were sensitive on the margin to changes in the world oil price, gasoline prices shot up. They stood at about 65 cents per gallon in mid-February (*Rockford Register-Star* (Illinois), February 15, 1979*a*).

The rises in prices of petroleum products in the United States were judged in some quarters to be out of proportion to the actual reduction in supply implied by the Iranian outage and other international developments (see, for example, *San Jose Mercury* (California), August 13, 1979). Friedman attributed the extra-large price response to "a major increase in demand" by users in a panicky reaction to the prospect of a longer-lasting disruption to supply (*Newsweek*, September 15, 1980).

There were, nevertheless, some hopes that the Iranian revolution would prove to have only very transitory effects on the supply and price of oil alike. For example, Philip Caldwell, president of Ford Motor Company, implied in remarks in mid-February that the current disruption to oil supply was temporary in nature (*Rockford Register Star* (Illinois), February 15, 1979*b*).[114]

But, just as, in 1974, the passing of the oil embargo—the previous episode of a major physical cutoff for the United States of oil imports—did not see the 1973−1974 oil price hike wound back, the return of more-normal oil-industry conditions in Iran after February 1979 did not see the 1979 price pressure reversed. Some indication that this would be the case occurred in February 1979 when, in testimony given by U.S. government officials, it was suggested that, when Iran oil imports resumed, they would be at a lower level, as a deliberate policy choice of

[114] Philip Caldwell, the Ford Motor Company executive, should not be confused with Philip E. Coldwell, who was a member of the Federal Reserve Board from 1974 to 1980 after having served in various positions (including president, 1968−1974) at the Federal Reserve Bank of Dallas. Both these individuals would eventually be at odds with Friedman in print: Friedman would criticize the views on trade expressed by Ford's Philip Caldwell (*National Review*, April 6, 1984, p. 44), while Philip E. Coldwell (who had by then left the Federal Reserve, after having attended well over 200 meetings of the Federal Open Market Committee from March 1957 to February 1980) would criticize Friedman's interpretation of and recommendations concerning U.S. monetary policy—while also daring Friedman to take a seat on the Federal Reserve Board instead of criticizing the performance of those who had previously accepted such appointments (see *Wall Street Journal*, February 9, 1981).

the new government (*Rockford Register Star* (Illinois), February 15, 1979*a*). Consistent with this prediction, as of late May 1979 Iranian oil exports, which had resumed, were 1.6 million barrels per day below their pre-revolution volumes.[115] Furthermore, there was prominent speculation that Iran might well hold back on restoring former levels of exports and that its ultimate setting of oil production would be made in coordination with the outcome of OPEC's end-June 1979 meeting on oil prices.[116]

President Carter embraces domestic price decontrol

The new developments in the market for world oil occurred in a situation in which U.S. domestic oil and retail gasoline prices had still not fully adjusted to the original oil shock in 1973−1974. Friedman had declared in August 1978 that the United States was in need of "a truly fundamental energy reform, which eliminated all controls on prices as well as our present subsidies [to] oil imports, which abolished the Department of Energy, enabling the market to go to work to produce, price, and distribute the energy we demand." In conjunction with reforms in other aspects of economic policy, this move, Friedman suggested, would "demonstrate to the world that we were awakening from our drugged state."[117] Nevertheless, as indicated in the previous chapter, he remained doubtful that U.S. oil prices would ever, in fact, be decontrolled.

A different outlook for energy policy was expressed in the television drama series *Dallas*. In the episode broadcast on U.S. network television on February 23, 1979, oil magnate (and lead character) J.R. Ewing stated: "I'm telling you—it is just a matter of time before the government lifts those price controls." Just under six weeks later, this prediction, articulated in the fictional realm, was borne out in the real world when, in a televised national address, President Carter announced that he would be decontrolling oil prices (see Carter, 1979b).

The Carter Administration's longstanding aim had been that the prices facing U.S. purchasers of crude oil and retail gasoline should fully reflect the increase in oil prices that had occurred since 1973. It was not, however, until the announcement in Carter's April 1979 address that U.S.

[116] See the remarks of Representative Clarence Brown during the hearing of May 31, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 498).
[117] Letter of August 22, 1978, to Senator Clifford P. Hansen, published in *Congressional Record—Senate*, September 11, 1978, p. 28645.

government policy in implementing this aim was to allow prices to be market-determined. Previously, the administration had merely been seeking that the prices faced by petroleum users be made equal to market values. In particular, through its Crude Oil Equalization Tax, or COET, proposal of 1977−1978 (discussed in the previous chapter), the administration had sought to raise the post-tax U.S. oil price to world levels—but to do so, not through actual decontrol of the pre-tax price, but by maintaining price controls, while using taxes to raise the price actually paid by purchasers. Although, under legislation passed in 1975, the United States' existing oil price controls were set to expire in 1981, the administration had, in the COET plan, proposed to supersede this legislation and to make oil price controls permanent. Then, as it became clearer during 1978 that the COET would fail to get U.S. Senate approval, the administration explored alternatives to decontrol and continued to do so into the first three months of 1979.[118] For example, the administration explored alternative means of raising petroleum prices, such as through a steep increase in the sales tax applying to gasoline (*Great Falls Tribune* (Montana), February 24, 1980). Such deliberations were testament to the administration's desire to make home petroleum prices more comparable to world levels through instituting taxes rather than through abolition of price control.[119]

---

[118] A contrary position has been taken by Eizenstat (2018, p. 212), who claims that it was at the Bonn economic summit of July 1978 that the Carter Administration committed itself to decontrol by agreeing to language in the summit communique "committing the U.S. government to lift controls on oil prices by the end of 1980" (p. 212). (Meltzer, 2009b, p. 945, similarly claimed, without documentation: "At the Bonn summit in July 1978, President Carter had agreed to decontrol domestic oil prices…") In fact, the summit communique did not make this commitment, and Carter's decontrol announcement in 1979 resulted from a distinct decision process. What Carter affirmed in 1978 was that, even if the COET plan failed, he would maintain the administration's efforts to seek a rise in U.S. oil prices to world levels. In particular, the July 1978 summit led to a communique statement: "the U.S. remains determined that the prices paid for oil in the U.S. shall be raised to the world level by 1980." (Quoted in Hakes, 2021, p. 240.) Note the word "remains"—confirming that this was *not* an announcement of a new policy of the U.S. government with regard to domestic pricing. Indeed, as Secretary of Energy James Schlesinger testified on April 24, 1979: "There has been a commitment by the administration for two years, and more, to move to world oil prices." Note also the communique's reference to prices being "raised" but not necessarily decontrolled. Schlesinger observed that, when the administration's existing policy was reaffirmed in the "Bonn commitment to raise [U.S.] energy prices to world levels," it was still "hoped that that could be done through the crude oil equalization tax." (The Schlesinger quotations are from Committee on Interstate and Foreign Commerce, U.S. House of Representatives, 1979, p. 27.) See also the editorial in the *Washington Post* (July 23, 1978), which similarly made the points that President Carter had long been committed to bringing U.S. oil prices up to the world level but still had not committed himself to doing so via decontrol instead of by some form of taxes (including tariffs, which he was able to institute under existing law).

[119] In a memorandum to Carter coauthored by Secretary of the Treasury Blumenthal on June 7, 1978, in which it was recommended that Carter make the pledge at Bonn to have oil prices raised even if the COET plan was not passed, the authors stated that it was "not essential to specify at the summit exactly what actions you would take" in place of COET and mentioned "fees and/or quotas" as an alternative option to decontrol that would bring home oil prices up (see Galpern, 2012, p. 489). And after the summit, a memo to the president of July 7, 1978, by Blumenthal, Charles Schultze, and some of Carter's foreign-relations personnel made it clear that a variety of options existed as means by which the Bonn summit pledge could be fulfilled, with decontrol being only one of these options (see Galpern, 2012, p. 494).

The administration's resistance to the decontrol option ended, however, with the April 1979 Carter speech, in which he noted that "the law gives me the authority at the end of next month to carry out this decontrol process," and he indicated that he would invoke that authority.

As the reference in the *Dallas* series indicated, there was much sympathy in the oil-oriented state of Texas for decontrol. Against this background, the financial columnist for the *Dallas Morning News* greeted Carter's announcement with a mixture of praise and sarcasm. Altwegg remarked that following the speech, "everyone was talking about what the president has had to say. After all, it preempted the first half of *Hawaii Five-O*, so a lot of people watched it." Altwegg welcomed the fact that "Mr. Carter has come round to the belief that price controls on crude oil should be phased out, or 'deregulated.'" This announcement, Altwegg observed, amounted to an endorsement of "what so many people have been saying for so long," but he implied that the Carter move was a case of the president changing his mind on the virtues of deregulated markets (*Dallas Morning News*, April 7, 1979).

This characterization was not altogether accurate, as Carter had, before April 1979, already been an enthusiast for deregulation in other sectors of the U.S. economy. It was nevertheless the case, however, that there was a qualitative difference between Carter's new acceptance of oil-price decontrol and most of his earlier endorsements of deregulation (such as in the area of airlines). Those earlier cases had usually been ones in which the immediate effect of deregulation would likely be lower prices faced by consumers. This was not the case for oil: although some, including Friedman, argued that oil-price decontrol would *ultimately* lower energy prices, it was widely accepted that the inevitable short-run effect of decontrol would be higher petroleum prices in the United States.

Consequently, whereas, according to the cost-push logic that the president typically applied to inflation analysis, other deregulation moves could be motivated as anti-inflation moves because they lowered prices in the deregulated sector, this could not be applied to the case of oil decontrol. For example, Carter would go on to state, on June 21, 1979, when advocating a trucking deregulation bill: "The best anti-inflation medicine, in my opinion, is real competition under the American free enterprise system."[120] This reasoning clearly did not apply in the short run to oil-price decontrol, even if one accepted (as Carter did, and Friedman did not) the cost-push reasoning that centered inflation-control policy on government attempts to influence

---

[120] Carter (1979c).

individual categories of goods prices. Consequently, unlike the other major Carter deregulation initiatives, Carter's acceptance of oil-price control was, as discussed further below, was centered on the microeconomic arguments for deregulation and on the virtues of providing price incentives to producers.

In response to Carter's decontrol plans, Friedman made it clear that he was far from satisfied. Nearly six months after the Carter address, Friedman remarked: "Jimmy Carter has not been in favor of decontrol… [A]ll he has come out for is gradual decontrol." (*Today*, NBC, September 28, 1979.) The reason why Friedman at this late point to refer to Carter's move as an announced, rather than an actual, policy was because Carter's proposal was not only phased but very spread-out and not even starting in 1979. The main phased decontrol of old-oil prices was due to start on January 1, 1980, and to occur in a staggered fashion through the end of September 1981.[121]

This timetable was chosen despite the fact that Carter had the power to initiate general oil price decontrol at any date from June 1, 1979, onward. Indeed, he could make full decontrol instantaneous if he wished: "President Carter has the authority to decontrol the prices of crude oil and gasoline immediately," Friedman observed (*Newsweek*, July 30, 1979). Friedman had earlier noted that, in contrast to areas such as disinflation—with regard to which he did favor a gradual policy—he opposed gradualism in area of natural gas and oil price deregulation, as the price mechanism could not completely clear markets and send the proper signals to market participants unless there was a situation of no price control (*Reason* magazine, August 1977, p. 29).[122] In the aftermath of Carter's decontrol announcement, Friedman declared that the president should decontrol petroleum prices fully and instantly—and have the law changed to remove remaining controls on natural-gas prices as well (*Newsweek,* June 11, 1979).

Supply incentives recognized

One of the major reasons the Carter administration gave for the phased character of decontrol—that the president's anti-inflation program required a slower increase in energy prices than otherwise—would have left Friedman unimpressed, owing to its emphasis on specific price rises

---

[121] See Carter (1979b) as well as James Schlesinger's testimony of April 24, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 20) and Charles Schultze's testimony of May 16, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 163).

[122] In the late spring of 1979, in the wake of the decontrol announcement, Friedman remarked: "Obviously, I welcome the decontrols, but all the rest of it is a disaster, including the gradual [implementation]… To really work, the program should call for immediate, complete decontrols." (*Expo*, Summer 1979, p. 18.)

as the source of inflation.[123] Friedman would, however, have reason to take satisfaction in the rationale that leading figures in the administration gave during 1979 when making the case for the overall policy of decontrol. Not only did they emphasize, as they had when selling the 1977 energy plan, the need to discourage energy demand by making the price faced by U.S. oil users equal to the world price and to remove the subsidy to oil importation implied by the existing system of price controls and entitlements. They also—this time, *in contrast to* 1977—stressed that decontrol would boost U.S. oil production. This shift on the part of U.S. officialdom amounted to a major change in philosophy—one in the direction of Friedman's thoughts on the matter.

For years, Friedman had cited the discouragement of U.S. oil production implied by the country's two-tier price system, under which strict price controls applied to one broad category of oil output—old oil—a situation magnified since 1975 by the higher, but binding, ceiling applying to another important category, new oil. He reaffirmed this point in his *Newsweek* column over 1979, including in his July 30 column lamenting the existing practice of "prohibiting the owners of domestic wells from receiving more than $5.94 for some categories of oil" (that is, old oil). This column also drew attention to the fact that the new-oil price ceiling of $13.24 was now also being rendered much lower in relation to global free-market prices by the recent world oil price increase.

The supply-depressing effects of price control had also repeatedly been pressed by members of the oil industry. This continued to be the case in 1979. For example, in a hearing on May 16 on the Carter decontrol proposal, the president of the Independent Petroleum Association of America, Jack M. Allen, testified that producers "are plugging oil wells today, and that is a tragedy that we should not be having," while adding that this precipitate closure of wells resulted "because the lifting costs exceed the $6 per barrel that is permitted for old oil."[124]

In 1979, there remained some skeptics among legislators regarding the notion that price controls had important supply-restraining effect. For example, the same day on which Allen testified saw

---

[123] James Schlesinger's testimony of April 24, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 19) stated that "to minimize the inflationary impact that could result at the time of decontrol, the president has adopted a more gradual path of phased decontrol." Similarly, Carter, in his telegram to senior U.S. diplomats on April 5, 1979, had justified the highly graduated nature of decontrol on the grounds that it would "minimize the burden on our anti-inflation program." (See Galpern, 2012, pp. 623−624.)
[124] From Allen's testimony in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 218).

Representative Al Gore (D-Tennessee) asserted: "We don't get any more old oil by decontrolling the price of oil already found."[125] But, predominantly, what was striking about the 1979 discussions was the extent to which, among elected representatives and the executive branch, there was now acceptance that price controls were a significant impediments to U.S. oil supply and to old-oil production in particular.

This shift was most evident in the statements of leading figures in the Carter Administration. As discussed in the previous chapter, in 1977 the administration had deprecated arguments that decontrol would boost oil supply. In contrast, in his energy address of April 5, 1979, President Carter stated that "federal government price controls now hold down our own production."[126]

These sentiments were echoed by Carter's subordinates in their own public statements. For example, on April 24, 1979, the Secretary of Energy, James Schlesinger, testified that the existing oil-price control system was in effect an "import subsidy program" that "reduced domestic production of oil." He also noted that "we have put in place a massive regulatory bureaucracy" in order for the federal government to administer the existing oil system.[127] This message was not altogether different from, although implying less personal culpability than, that Friedman articulated in his *Newsweek* column some weeks later (in his column of June 4, 1979) when he lamented "how useless, indeed harmful, are the activities of James Schlesinger and his 20,000 employees."

The head of the Council of Economic Advisers, Charles Schultze, also affirmed the importance of decontrol as an impetus to higher production when he stated that "even in old-oil reservoirs… additional oil can be produced. So higher prices would provide incentives… to bring into production this additional oil from older fields."[128] On the same day as Schultze's testimony, a submission by Secretary of the Treasury Michael Blumenthal observed that the decontrol program "eliminates the disincentive to produce from old oil fields, since the profit earned from increased production in old oil properties will be the same as from investments in new oil properties."[129]

---

[125] From Gore's remarks of May 16, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 270).
[126] Carter (1979b).
[127] In Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 18).
[128] From Schultze's testimony of May 17, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 340).
[129] From the prepared portion of Blumenthal's testimony of May 17, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 379).

These sentiments echoed Friedman's many remarks on the subject, including his 1975 reference to the "disincentive to produce old oil" (Instructional Dynamics Economics Cassette Tape 168, May 1975, Part 2).

A further poignant statement by Blumenthal was reported in early July: "The more I'm in the government, the more market-oriented I become. No bureaucrats… at the Department of Energy, trying to figure out how much gasoline each gas station in the country should get, can set out a way to distribute gas in this country." (*Time* magazine, July 9, 1979.)

Gasoline lines and allocations

This Blumenthal statement was made with specific reference not to the price controls but, instead, to government directives concerning the distribution of gasoline to service stations. These federal controls over fuel quantities in the United States—the allocations system—had been in force since 1973 and they underlay Friedman's statement during the Ford years, "I'm astounded with the willingness of the public at large to let the people who cannot deliver the mail deliver gasoline." (*Corpus Christi Times* (Texas), February 14, 1975.) It was, however, just as President Carter was going in a deregulatory direction by foreshadowing the end of oil price controls that the effects of the allocations system—a distinct aspect of federal regulation of petroleum—really came to the fore.

In conjunction with the still-in-force price controls, the allocations system led to major gasoline shortages and lines at service stations over much of 1979. Carter had launched his 1977 energy plan while noting that it was being launched alongside placid conditions at the retail level: "The 1973 gas lines are gone."[130] By the time the 1979 energy plan was being debated, however, the situation was very different, with the deputy secretary of the Department of Energy, John J. O'Leary, noting in mid-May 1979 that there were "long lines in gas stations in certain parts of the country, and weekend closings in most of the country."[131]

Over the summer of 1979 and into the early fall, Friedman repeatedly discussed the return of gasoline lines. Although his *Newsweek* column of June 4 cited immediate elimination of the country's petroleum price controls as the way to end the gasoline shortage, his July 30 column added "eliminating government allocation of gasoline" as a second necessary condition.

---

[130] Carter (1977c), also quoted in *The Decatur Daily* (Tennessee), April 19, 1977.

[131] From O'Leary's testimony of May 16, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 173).

Friedman had long noted that, notwithstanding various claims that the U.S. government-controlled prices but had not engaged in rationing, there was actually a form of rationing in place as part of the federal government's network of controls, even though this rationing system was not usually visible to purchasers at the retail level. As he observed soon after the first oil shock: "if you have a look at what is going on now, in a sense, you already have rationing—except it's being called 'allocations.'" (Instructional Dynamics Economics Cassette Tape 136, December 13, 1973.)

The U.S. government had, through the allocations system, set up arrangements designed to distribute domestically-produced and imported petroleum product across service stations. The distribution rules had been guided by how gasoline had been demanded in the 1972–1973 timeframe.[132] By 1979, these distribution rules were sufficiently out of kilter with the pattern of gasoline demand across the United States that major gasoline shortages emerged in many areas of the country. Up to this point, following the end, in early 1974, of the Arab oil producers' embargo, the official price controls on petroleum products had tended not to be associated with major shortages at service stations—as the importation of oil imparted some upward slope into both the supply and price of petroleum available to U.S. purchasers. But in 1979, the phenomenon of major queues at, and exhaustion of supplies at, of gasoline stations returned—a joint product of the allocations system and the price controls.[133] Although the Iranian outage in early 1979 played an important role in initiating the new wave of gasoline lines, these lines continued after Iranian imports resumed and were particularly acute during the summer.

As the shortages continued past summer 1979, Friedman remarked on television that "there's no doubt that long gas lines are produced by Washington and nobody else." He cited the controls on the prices of crude oil and retail gasoline, as well as the official controls on allocation of gasoline from station to station. "People in Washington are simply not in a position to do a sensible job of shifting gasoline around," Friedman noted (*Today*, NBC, September 28, 1979). But the experience of 1979 saw the administration give little ground on quantitative controls: in April, even while testifying in favor of post-1979 price decontrol, James Schlesinger, remarked:

---

[132] See the testimony of May 16, 1979, of Charles J. DiBona, president of the American Petroleum Institute, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 129).

[133] The role of the allocations rules in generating the gasoline lines of summer 1979 was acknowledged in the account of the Carter years by the president's former domestic adviser: see Eizenstat (2018, pp. 234–235, 671, 682). Eizenstat's stress on the interaction of these allocation controls with *retail gasoline price* controls in generating queues at service stations during this period may, however, obscure the fact that, even if no gasoline price controls had been present, the federal government's separate (and, in practice, much more rigidly enforced) crude-oil price controls were another factor that, in conjunction with the allocations system, made for shortages in this period.

"I think we would have to retain the authority to allocate in the event… of a crisis."[134] Furthermore, Carter's adviser on inflation, Alfred Kahn, suggested in late June that the United States should consider direct rationing of consumers' access to gasoline (*Detroit Free Press*, June 29, 1979*a*).

The exasperation on the part of Friedman and other economists at the failure of the Carter Administration to expedite deregulation of the energy market—and to go in a different direction in important respects—was reflected in a joint statement, published as an advertisement in the *Washington Post* (October 11, 1979) and, as with the 1977 statement, arranged by the National Taxpayers Union. Friedman's name led a long list of signatories, which also included several who had been prominent allies of his in monetary-economics debates in the 1960s and 1970s (including Anna Schwartz, David Meiselman, Robert Lucas, and Allan Meltzer), some figures (including Arthur Laffer and Alan Greenspan) who had been other major free-market advocates in the 1970s, and many former Friedman students (including Douglas Adie, William R. Allen, Warren Coats, Sam Peltzman, William Poole, Thomas Sowell, and Richard Timberlake).

The statement took Carter to task for blaming OPEC for the gasoline lines, while also challenging the stress being put on developments in Iran: "A disruption in world oil production, such as that caused by the revolution in Iran would not lead to gas lines here, as it did not in other countries, if the market were permitted to allocate supplies." The blame for the lines at service stations instead lay with "the government price controls and allocation[s] system." The statement called for Carter to abolish these regulations immediately criticized his move (made in mid-July) to add a new quantitative control in the form of an oil-import quota.[135]

The degree of frustration that had been generated over the summer of 1979 at the government control system was evident in the fact that the joint statement also called for the abolition of the Department of Energy. This was not a new prescription on the part of Friedman, but it was notable that so many others signed up in endorsing it, including signatories to the statement, like Martin Bailey and Robert Gordon, who had looked more favorably on government intervention in the economy than he had.

---

[134] From Schlesinger's testimony of April 24, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 91).
[135] Carter had announced this move in his July speech, referred to further below, on new energy-policy measures (Carter, 1979d).

The prospects for the oil industry

An op-ed by Friedman that appeared in the *San Francisco Chronicle* shortly before the Carter decontrol announcement noted that, in light of postwar developments, advocacy on economic grounds of the nationalization of private-sector industries had all but dried up: "Nobody makes that argument anymore."[136] Friedman feared, nevertheless, that the oil industry might be an exception to this trend. Indeed, near the end of the year, he speculated in his *Newsweek* column that a second Carter term might see the big oil companies nationalized (*Newsweek*, December 10, 1979). In the same vein, in California (one of the states struck the most by the summer gasoline lines), the newspaper *San Jose Mercury*, in an editorial some months earlier (August 13, 1979) on "The Unspeakable Word" (that is, nationalization), had suggested that the U.S. oil companies had fallen so much in national standing that, barring a change in image, "they can expect to hear the unspeakable work spoken often, and loudly, in the future."

Carter's move toward decontrol ostensibly moved the energy sector closer to a free-market system because it sought to terminate the federal government's oil-price ceilings. But, as Friedman had stressed in the 1940s in his critique of Oskar Lange's "market socialism," even a system in which prices cleared markets need not correspond to a true market system, if the government preempted the flows of incomes implied by freely operating prices and made other interferences in the production process.[137]

Likewise, Friedman likely drew little comfort from the fact that, in Carter's decontrol announcement in April, the president had cited the fact that in the federal government's efforts "to control energy price, production, and distribution, the federal bureaucracy and red tape have become so complicated, it is almost unbelievable." For Friedman had long suspected that streamlining the operations of government was an interest of Carter's mainly "so that the power of Washington can be exercised more efficiently."[138] Correspondingly, to Friedman, Carter's 1979 energy proposals (officially called "The National Energy Plan II"), when viewed as a whole, represented a move toward greater public-sector control of the oil industry—and did not, on net, take the government away from directing the nation's energy production and

[136] *San Francisco Chronicle*, April 3, 1979. The op-ed was a condensation of a *Milton Friedman Speaks* talk that Friedman had given in 1977.
[137] See Nelson (2020a, Chapter 4).
[138] Instructional Dynamics Economics Cassette Tape 202 (November 1976, Part 1). Another motivation, already noted, that Carter had for lowering or streamlining government regulation—the control or lowering of inflation—obviously also did not impress Friedman favorably.

distribution.[139] On the contrary, he argued in a summing-up in October. "The Carter program would be another disastrous step [toward] converting America from a free society to corporate state."[140]

Other than the continuation of allocation powers, noted above, and what Friedman perceived as the threat embedded in the plan of the return of price controls in the future (*Newsweek*, July 30, 1979), there were a couple of features of National Energy Plan II, especially in its modified July 1979 version, that underlay Friedman's warnings about it. First, the plan involved extensive plans for the federal government to identify potential alternatives to oil and promising alternative methods and make large outlays on these ventures. Writing in *Newsweek*, Friedman made the point that the proposed government activity in energy development was likely to involve the country spending much more per unit on synthetic fuels than the consumer would pay even for the higher (*Newsweek*, July 30, 1979). He also continued to have a negative reaction to the plan's notion, previously made during the Nixon and Ford years, that the federal government should spearhead research into alternatives to oil. In opposing the synthetic-fuel programs, Friedman was able to gain agreement from the other economists in the joint public statement mentioned earlier: "Where is the evidence that our energy future would be more safely entrusted in government than to private companies[,] operating under the spur of profit and competition?" (*Washington Post*, October 11, 1979.)

The public statement did not, however, refer to another prominent item in the new energy plan: the proposed windfall profits tax. As proposed by the administration, this tax would apply to those profits, during and after the price-decontrol process, to sellers of old oil, that arose from the difference between the market price and the previously-applying old-oil price ceiling. The tax would also apply to profits that most sellers of oil accrued from market prices in excess of $16. In effect, the proposed windfall profits tax was targeted at oil sales receipts that U.S. oil producers received as a result of the first oil shock and the emerging new oil shock.

Friedman considered the windfall profits tax to be akin to the existing price-control system on the grounds that both mechanisms denied producers from "reaping the benefits" of having set up oil production sites before the oil shocks. Both mechanisms amounted to a "socialist solution" in

---

[140] Davidson and Friedman (1979, p. 410). By the time of this statement, the Carter energy program included both the version of National Energy Plan II announced in April-May 1979 and the augmentations to the plan Carter had made in mid-July. These augmentations sought to increase further the role assigned to the federal government in the long-term planning and production of national energy resources.

which firms, in an unfavorable outcome, had to absorb losses arising from risky ventures but, in a favorable eventuality, had to hand much of the associated profits over to government: a "heads-you win, tails-I-lose" situation (*Newsweek*, July 30, 1979)[141] This argument mirrored what Friedman had contended since 1973: in order for there to be incentives to add to supply, the revenue from price rises should accrue to U.S. producers.

The argument also mirrored points Friedman made of the April 1977 Carter plan. However, the 1979 windfall-tax proposal differed from the 1977 plan, as the Carter administration had, as indicated above, become more sympathetic to supply-incentive arguments. In 1977, it had essentially proposed that all of the receipts arising from the first oil shock should be denied to oil produced from old wells (and a considerable portion denied to newer wells, too). These receipts would be diverted entirely to tax revenues. In 1979, the administration was arguing, instead, that oil companies indeed have these receipts as income but then pay tax on the receipts at an extra-normal rate.[142] And the rate that the administration proposed for this purpose was notably below 100 percent—which had been the implicit tax rate embedded in the administration's 1977 COET plan. In 1979, the labor organization AFL/CIO called for an 85 percent windfall tax rate, and the House of Representatives' Committee on Ways and Means recommended a rate of 70 percent.[143] Neither of these rates was far below 100 percent. But the Carter Administration's own proposal in 1979 advanced a much lower rate: 50 percent.[144] In addition, the notion that a windfall profits tax should serve as a *quid pro quo* in exchange for oil price decontrol had been proposed previously, by both the Nixon Administration (in early 1974) and the Ford Administration (in early 1975) as well as by a group of Republican senators in 1977.[145]

Among commentators on policy developments, Friedman was not completely on his own in

[141] See also his remarks in *Expo* (Summer 1979, pp. 18, 20).

[142] For example, Secretary of the Treasury Blumenthal testified on May 17, 1979, that the "reason that we are not [in the proposed changes] taxing away all of the increased revenue and, indeed, are leaving a very important part of the increased revenues with the owners and producers of old oil… [is so] substantial [production] incentives can be provided." See Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 393).

[143] See respectively *San Jose Mercury* (California), August 13, 1979, and *Detroit Free Press*, June 29, 1979*b*.

[144] See, for example, James Schlesinger's testimony of April 24, 1979, in Committee on Interstate and Foreign Commerce, U.S. House of Representatives (1979, p. 20), as well as the discussion in U.S. Department of Energy (1979, p. 80).

[145] On the 1974 and 1975 proposals, see Committee on Ways and Means, U.S. House of Representatives (1974, 1975) and the discussion in Chapter 6 above. On the inclusion of a windfall profits tax in the energy plan advanced by Republican senators in 1977, see Committee on the Judiciary, U.S. Senate (1978, p. 226). In mid-1979, soon after the second oil shock was formalized by an OPEC decision, George Shultz reaffirmed his support for this kind of tax: "When I was Secretary of the Treasury, I did propose a windfall profits tax... [to be] phased out at the end of five years. I [still] think there is something to be said for an approach like that, when you have this tremendous, sudden rise." (Testimony of July 30, 1979, in Committee on the Judiciary, 1979, p. 576.)

wholeheartedly opposing a windfall profits tax on oil profits and in seeing a special tax as a disincentive to the risk-taking.[146] But among economists, he did not have a clear critical mass of support. Kenneth Arrow did voice doubt about the feasibility of designing an appropriate windfall profits tax on oil revenues, although he was not categorically opposed to the idea of instituting such a tax.[147] Support for a windfall profits tax as part of the U.S. policy response to the oil shocks of the 1970s was, in fact, quite commonplace among economists. Even Arthur Laffer had, in 1977, had been favorably disposed toward giving the U.S. president the authority to activate a windfall profits tax, provided that price decontrol was put into effect.[148] The fact that the Friedman-led joint statement by economists in October 1979—which essentially repeated numerous other criticisms Friedman made of the Carter administration's energy policies—did not take a stand on the National Energy Plan II's proposal for a windfall profits tax attested to the fact that Friedman's outright opposition to the tax was not uniformly shared even by economists who basically favored a free-market approach to energy policy.

Friedman, therefore, looked poised to be on the losing side of the windfall-tax debate. He recognized this in mid-1979 when, after declaring that "Mr. Carter's call for the tax is pure demagoguery," he granted that the tax might well be enacted into law as "Congress is a bunch of demagogues too" (*Expo*, Summer 1979, p. 18). The House of Representatives passed, on June 28, 1979, its own version of the windfall profits tax with a rate of 60 percent (lower than that recommended at the committee stage, but higher than the Carter Administration's desired 50 percent rate).[149] But, as of early December 1979, this bill had not yet been passed by the Senate. The possibility therefore remained that the windfall profits tax would not become law in 1980, even though oil price decontrol would definitely proceed.[150] Against this background, Friedman devoted a December *Newsweek* column largely to reiterating his stand against the idea of a windfall profits tax.[151] He restated his position that the owner of an asset should not be subject to extra-large tax on the receipts arising from the appreciation of that asset, even if others judged the appreciation to be the result of "fortuitous changes in market conditions" (*Newsweek*,

[150] Carter had written to senior U.S. diplomats abroad in April: "My decision to decontrol oil prices is not contingent on the passage of these taxes." (Telegram of April 5, 1979, quoted in Galpern, 2012, p. 624.) Similarly, Secretary of the Treasury Blumenthal stated, in testimony of July 10, 1979, that the administration's policy was to press ahead with decontrol, "whatever else is done" in the area of taxes on energy. (In Committee on Finance, U.S. Senate, 1979, p. 54.)
[151] Friedman had been critical of an excess profits tax (a variant of the windfall profits tax) as far back as 1953. See Friedman (1953b, p. 8).

December 10, 1979). On December 17, 1979, however, the Senate passed its own version of the windfall profits tax, thus making it very likely that a version of the tax would become law in 1980 (*Bangor Daily News* (Maine), December 19, 1979).

The second oil shock becomes official

The second oil shock became official on June 28, 1979, when the outcome of the midyear OPEC meeting in Geneva was a new world oil price floor of $18 (*Detroit Free Press*, June 29, 1979*c*). A statement by President Carter observed that this move implied a cumulative 60 percent increase in the world oil price since December 1978 (*Detroit Free Press*, June 29, 1979*d*). As it transpired, the price increases still had much further to go, and the world price of crude petroleum went from $18 at the end of the third quarter of 1979 to $26 per barrel six months later (International Monetary Fund, 1981b, p. 145).[152] Likewise, although U.S. gasoline prices were assessed by Secretary of the Treasury Blumenthal as likely to be pushed up by twelve cents a gallon by OPEC's June decision, the increase in gasoline prices in 1979 proved to be far in excess of this: the rise in the annual national average of the gasoline price was 23 cents from 1978 to 1979—from 63 cents to 85 cents. And in November 1979, U.S. gasoline prices averaged about $1.04 per gallon (*Rutland Daily Herald* (Vermont), December 20, 1979).[153]

Soon after the OPEC June oil-price decision, President Carter stated that it would add 2 to 2½ percentage points to the inflation rate (*Dallas Morning News*, July 2, 1979, p. 1A).[154] About ten weeks later, he remarked that he viewed the main effects of higher energy prices as having already been felt and that the inflation rate should "go down [in] the rest of the year" (*Omaha World Herald* (Nebraska), September 13, 1979). In contrast, as discussed in Section I above, U.S. inflation continued to increase over the rest of 1979 and into 1980. But, with global oil prices having also risen further over this period, Carter blamed the additional upturn in inflation on the oil shock. For example, in his televised debate with Ronald Reagan in October 1980, Carter stated that "in the first quarter [of 1980], we did have a very severe inflation pressure,

[152] The Texas crude oil price shows a somewhat more rapid rise—from $14.85 in December 1979 to $32.50 in December 1979 (*https://fred.stlouisfed.org/series/WTISPLC*).
[153] Blumenthal gave his estimate in testimony on July 10, 1979 (Committee on Finance, U.S. Senate, 1979, p. 49). For the annual averages of the retail price of U.S. gasoline, see "Fact #915: March 7, 2016: Average Historical Annual Gasoline Pump Price, 1929–2015," *https://www.energy.gov/eere/vehicles/fact-915-march-7-2016-average-historical-annual-gasoline-pump-price-1929-2015*.
[154] In his testimony of July 10, 1979, Secretary Blumenthal indicated that this estimate included effects of oil price increases since December 1978 and prior to the June OPEC decision, and he suggested that the contribution to higher inflation would be spread about equally over 1979 and 1980. See Committee on Finance, U.S. Senate (1979, p. 49).

brought about by the OPEC price increase."[155]

Much analysis at the time shared Carter's emphasis on the second oil shock as the driver of the United States' inflation problems. For example, in mid-1979, a *Minneapolis Star* commentary asserted that the "escalating price of gasoline… is contributing mightily to the rate of inflation," while the *Miami Herald* responded to the outcome of the Geneva OPEC meeting with the headline "OPEC Sends U.S. Some More Inflation."[156] Friedman, however, eschewed such diagnoses. "OPEC does not cause inflation—no, sir," he testified in a hearing in May 1979.[157] "Inflation is not produced by high oil prices," he reiterated in an interview that appeared as it was becoming clear that a lasting oil-price increase was in train, while lamenting the "gross confusion" between relative prices and absolute prices involved in blaming inflation on energy-price behavior (*Expo*, Summer 1979, p. 18).[158]

Friedman would subsequently grant that "the most recent oil shock" was a source of a temporary boost to inflation during the period in which the new energy prices took effect, irrespective of what a monetary policy stance a country had adopted in the leadup to the shock.[159] In the case of the United States, this boost was, as he saw it, what pushed the 12-month rate above fourteen percent in early 1980 when his own prediction, on the basis of prior monetary developments, had been for a peak in inflation in 1979−1980 of twelve or thirteen percent.

OPEC's consecration in June 1979 of the second oil shock did bring greater concurrence in U.S. commentary on the likelihood of a 1979 recession—something Friedman was already expecting on the basis of monetary patterns. President Carter remarked: "I think the OPEC decisions will make a recession much more likely than it was before." (*Dallas Morning News*, July 2, 1979.) And, testifying in mid-July, Federal Reserve chair Miller argued that the monetary policy tightening had been calibrated in a manner designed to produce slower economic growth but not a recession, but, on account of "the oil shock, we now expect there to be a recession this year."[160] And, writing in the *Financial Times* in early August, Paul Samuelson, noting that the Chase

[158] The interview was conducted ahead of the summer of 1979, while Friedman was physically located at the Hoover Institution (*Expo*, Summer 1979, p. 18).
[159] Friedman (1982a, p. 102).
[160] From Miller's testimony of July 17, 1979, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1979b, p. 3).

Econometrics firm saw negative economic growth firm in each of the four quarters from 1979:Q2 to 1980:Q1, characterized the environment as one of near-unanimity about 1979 being a recession year, and he implied that Friedman should be among those congratulated for successfully predicting this eventuality (*Financial Times* (London), August 6, 1979).

Writing in September, Friedman, too, thought the prediction had been realized and opened a *Newsweek* column: "Recession? Looks like we're in one."[161] As we have seen, however, the U.S. economy did not enter recession in 1979—with Friedman seeing a lessening of monetary policy tightness in the spring-summer 1979 period as the reason. By the time recession did actually begin in 1980, not only had the second oil shock developed to a much fuller extent, but monetary restriction had again become a major factor making for recession.

Carter's shake-up

President Carter made a televised address to the nation on July 15, 1979. Although originally planned to be centered on his announcement of further changes in his energy policy in light of the summer's energy-supply disruptions, the portion of the speech only came after Carter had spoken at length about his concern regarding the country's overall mood and condition. This broad-ranging aspect of the speech would come to be characterized in many retrospectives as a criticism by the president of the attitude of the U.S. citizenry and would be used against Carter. In the immediate aftermath of the speech, however, Friedman contrasted this aspect of the speech favorably with its policy component. "As a philosophical and theological speech, it was excellent," Friedman remarked on the speech, "[but] as a proposal for our energy crisis, it was terrible." (*Chicago Tribune*, July 16, 1979, p. 12.)[162] His *Newsweek* column (July 30, 1979) following the address criticized Carter's failure to cite price controls as the reason for the gasoline shortages.[163] As already indicated, the speech instead put great emphasis on long-term

[161] *Newsweek*, October 1, 1979. As already noted, the second-quarter U.S. GNP data had initially pointed in this direction by registering negative real growth. It was on the basis of this single-quarter decline (later revised to a slightly positive number) that a *Financial Times* news item (July 21, 1979) was headed: "U.S. GNP Fall Confirms Recession." Similarly, Paul Samuelson, after tentatively stating that "we appear to be in a recession," went on in the same column to refer to "the present recession" (*Newsweek*, September 24, 1979).

[162] Friedman's praise for the philosophical aspects of Carter's speech was consistent with remarks he had made over the years that were not too far removed from some of the sentiments Carter had expressed. For example, in testimony given to a Congressional hearing on October 6, 1969, Friedman had referred to "the widespread feeling of malaise in this country… reinforced by dissatisfaction over Vietnam." (In Joint Economic Committee, 1970a, p. 810.) That said, in 1969 and 1979 alike, Friedman's identification of the underlying reasons (other than the Vietnam War) for this national mood, together with his prescribed remedy, differed from Carter's in 1979.

[163] Even Friedman's old sparring partner Robert Eisner was quoted criticizing Carter for not mentioning the price mechanism in the speech (*Chicago Tribune*, July 16, 1979, p. 12). Carter's speech had gone in the opposite

government development of synthetic fuels—a proposal that led Friedman to remark: "The idea of creating a system that involves [the equivalent of] wartime economic planning would be disastrous if it ever was carried out." (*Chicago Tribune*, July 16, 1979, p. 12.)

The two weeks after Carter's speech were followed by numerous personnel changes. Among the announcements made in this connection was that James Schlesinger would depart the post of Secretary of Energy and Michael Blumenthal would go as Secretary of the Treasury. Carter nominated G. William Miller as Blumenthal's successor and, on July 26, put forward Paul Volcker to succeed Miller as Federal Reserve chair. Following their confirmations, Miller and Volcker were both sworn into their new positions on August 6, 1979 (see Carter, 1979e).[164]

In a *Newsweek* column to mark Volcker's ascendancy, Friedman reviewed the record of monetary growth and inflation during the 1960s and 1970s. Inflation was likely to reach a peak before long, Friedman predicted, in light of the decline in monetary growth (measured by the M2 series) since 1977. But the United States' economic record since the mid-1960s suggested that this peak would not be followed by a restoration of price stability. "The problem is not, as President Carter [in his July 15 speech] asserts, a lack of confidence," Friedman wrote. "The problem is rather that the public is very confident that the government will produce inflation and will mismanage the economy. We do not need more confidence in bad policies. We need better policies." (*Newsweek*, August 20, 1979.)

INTRODUCTION OF THE NEW OPERATING PROCEDURES

The changes in Federal Reserve policy associated with the ascension of Paul Volcker to the position of Federal Reserve chair in 1979 have given rise to a voluminous research literature that

---

direction, stating (Carter, 1979d): "I ask Congress to give me authority for mandatory conservation and for standby gasoline rationing." Eizenstat (2018, p. 689) indicates that Carter in July 1979 instantly rejected Eizenstat suggestion of moving to immediate decontrol at the retail level, that is, to abolish the allocations system and the controls (essentially controls on the markup over the wholesale price of gasoline) on the retail price of gasoline. Although Carter did not mention the allocations system in his speech, Secretary of the Energy Schlesinger had testified several days earlier that "the president has decided he does not want to scrap… the allocation[s] system." (Testimony of July 10, 1979, in Committee on Finance, U.S. Senate, 1979, p. 139.)

[164] Volcker had been vice chairman of the Federal Open Market Committee under Miller. This position was due to Volcker's status as president of the Federal Reserve Bank of New York. To become Federal Reserve chairman and chairman of the FOMC, he had to receive presidential nomination and Senate confirmation (and, in the process, also become a member of the Federal Reserve Board). Consequently, when Friedman wrote to Volcker to mark "your 'promotion'" (see Silber, 2012, p. 148), the word "promotion" was in quotation marks to reflect the fact that the move from the vice-chair to chair position involved these nomination-and-confirmation processes in the executive and legislative branches of the U.S. government, rather than comprising simply a promotion in rank within the Federal Reserve System.

now spans more than four decades. Those changes can, essentially, be divided into two groups: tactical changes—the Federal Reserve's adjustments, as embedded in the "New Operating Procedures" issued on October 6, 1979, to its market operations and monetary-control techniques—and strategic changes—alterations to the doctrine guiding U.S. monetary policy (in particular, the Federal Reserve's conception of the nature and extent of its influence on inflation), together with the related shift in policymakers' reaction function.

Both the changes at the tactical level and those at the strategic level owed much to the longer-term influence that Friedman had on thinking about monetary policy in the United States. As it happened, the tactical changes proved largely ephemeral—with the Federal Reserve's 1979 move to a reserves-based operating procedure being, in effect, terminated in 1982 in favor of a return to operations largely focused on the management of the federal funds rate. The strategic changes proved far longer-lasting—the year 1979 saw a distinct and permanent change in the Federal Open Market Committee's reaction function (see, for example, Clarida, Galí, and Gertler, 2000) and in its conception of the scope for monetary policy to set the longer-term inflation rate (see, for example, Romer and Romer, 2002b, and Nelson, 2005).[165]

From a longer-term perspective, therefore, the strategic changes were clearly more profound than the tactical changes. It follows that, of the two sets of changes, the strategic changes amounted to a much better example of Friedman's lasting influence on the course of monetary policy. Nevertheless, the tactical change—the FOMC's adoption in 1979 of what were called the New Operating Procedures—seemed to be the more dramatic event at the time—and it certainly was the one to which Friedman devoted more attention in 1979. That change in monetary-control techniques is therefore considered here first—in the remainder of this section. Strategic changes are then considered in the discussion titled "Paul Volcker" in Section III. It should also be noted that, in the analysis of the New Operating Procedures presented here, the focus will be on the buildup of outside pressure to move to new operating techniques and on Friedman's initial reactions to the Federal Reserve's 1979 changes. No attempt is made to give a detailed account

[165] Meltzer (2009b, pp. 1033–1034) also stressed that strategic changes in policymakers' thinking were the most important outcome of the October 1979 developments even though they were not the main focus of media coverage at the time. Meltzer, however, expressed the strategic change as an increased weight on inflation, in relation to real variables, in the Federal Reserve's objective function. This way of portraying the change was not ideal. It failed to capture either (*i*) the fact that the Federal Reserve saw inflation as highly costly (in its economic effects) both before and after 1979, or (*ii*) the notion that the Federal Reserve moved to viewing inflation as a monetary phenomenon in this period. In contrast to Meltzer's characterization of the 1979 change in strategy, that shift is seen best as a change in the Federal Reserve's model of the economy—and *not* as a change in the respective weights placed on its nominal and real economic objectives.

of the developments within the Federal Reserve that led to the choice of the new procedures.[166]

The pressure for reform of operating procedures

As has been noted in the previous volume and in earlier chapters, Friedman granted that, during the 1970s, the Federal Reserve had paid more attention to monetary aggregates and that, indeed, a specific target rate of growth for the aggregates had typically been a factor entering into the Federal Open Market Committee (FOMC) meeting-to-meeting policy decisions (and had also weighed on the monetary policy actions, such as with respect to reserve requirements and the discount rate, taken by the Federal Reserve Board). As Friedman saw it, a major (though not exclusive) reason why the FOMC had not done better in achieving steady monetary growth lay in its continued use of the federal funds rate as an instrument.

For the majority of the 1970s, the FOMC had had an adjustable target for the funds rate—with the adjustments ostensibly guided by the need to achieve the intermediate, monetary-growth targets. But, as Friedman often noted—especially in his commentaries from 1975 onward, when the monetary-growth targets became more official—the FOMC had a fine record at achieving its funds-rate target but nowhere the same degree of precision or success with regard to delivering monetary growth on target. This point would, in retrospect, be underlined by Rudebusch's (1995, p. 258) chart of the federal funds rate and the target rate from 1974 to 1979, showing a very close match between the target and actual series. In addition, the deviations between the two series did not have the persistent, one-sided character that had frequently characterized the Federal Reserve's pursuit of monetary targets during the 1970s.

Friedman saw the means to secure much better control of growth in series like M1 and M2 as lying in a move by the Federal Reserve to direct management of its balance sheet, in place of the use of a federal funds rate target. Reflecting this conviction, in a letter to Volcker on July 31, 1979—written after Volcker had been nominated to be chair and at a point when his accession to the position the following week was virtually assured—Friedman stated that the Federal Reserve System needed to make "major changes in its method of operation" in the direction of arrangements better suited to deliver a gradual step-down in the rate of monetary growth.[167]

---

[166] Friedman's reactions to unfolding developments during the 1980–1982 portion of the New Operating Procedures period are considered in later chapters. On the internal Federal Reserve deliberations that led to the 1979 change in procedures, see especially Lindsey, Orphanides, and Rasche (2005) and Meltzer (2009b, pp. 1016–1033).
[167] Quoted in Silber (2012, p. 149). Silber notes (p. 148) that the handwritten letter was dated "July 31, 1912 (Friedman's birthday)." It was likely that this was nothing other than a slip in writing the date of July 31, 1979

As Volcker took office, the outside pressure on the Federal Reserve to reform its operating procedures was also reaching a crescendo: Friedman's call in his *Newsweek* column (August 20, 1979) for the Federal Reserve to abandon its "love affair with interest rates" was echoed by his friend, UCLA's William R. Allen, who declared in a radio commentary in the fall of 1979 that the Federal Reserve's existing operating procedures amounted to an "American tragedy" and that the U.S. monetary authorities had been "mesmerized" by interest rates.[168]

Why was the choice of short-run policy instrument crucial for successful monetary targeting, according to this interpretation? One reason was that the federal funds rate target was adjusted by only small increments. The Federal Reserve, as we have seen, raised the funds rate by an amount in excess of the rise in inflation in 1978, and monetary growth fell. But in the year starting in mid-1978, its increases in the funds rate, although sufficient to brake monetary growth during part of that period, were, on the whole, less than the rise in inflation. As this phenomenon unfolded, the Citibank *Monthly Economic Letter*—a voice of monetarism in financial commentary during the 1970s and, late in the decade, often authored by Friedman's former student James Lothian—observed (January 1979, p. 5) that "the inflation-induced rise of interest rates seems to have had little impact on spending and output, and there is no reason to believe it should have."

In addition, the preoccupation with small adjustments to the federal funds rate reduced the Federal Reserve's ability to generate a smooth profile in the time series of the quantity of bank reserves. As Anna Schwartz wrote to legislators in April 1979: "The attempt of the Federal Open Market Committee to peg the federal funds rate results in a procyclical behavior of the monetary aggregates. During cyclical expansions in business, the FOMC accelerates the flow of reserves to banks in order to slow the rise in the federal funds rate; during cyclical contractions, it decelerates the flow of reserves in order to slow the decline in the federal funds rate."[169]

These criticisms—according to which the monetary growth rate implied by a chosen federal funds rate varied both with the business cycle and with inflation—were expressions of a critique

(which, obviously, was Friedman's birthday, too, but a date he was far less accustomed to writing down). A more intentional reference by Friedman to his birthday occurred later in the year when his *Newsweek* column of December 10, 1979, outlining the possible state of economic policy in 1984, set the scene with the opening line "Washington, D.C., July 31, 1984." This piece of whimsy on Friedman's part was omitted by editor William R. Allen when the column was reprinted, otherwise intact, in Friedman (1983a, pp. 319–322).

[168] Allen's broadcast was dated October 1979 (but evidently drafted before the changes in operating procedures announced on October 6. See the transcript of the broadcast in Allen (1981, pp. 242–243).

[169] Schwartz (1979b, p. 309).

of Federal Reserve operating procedures that Friedman himself had articulated many times.[170] He summed things up in June 1976 as follows: "Whenever market interest rates have been tending to rise for whatever reason, the Fed has tended to produce a more rapid rate of monetary growth than it intended. Whenever market interest rates have been tending to fall, the Fed has tended to produce too slow a rate."[171] The upshot was that, as the *Wall Street Journal* piece (January 23, 1979) observed, the Federal Reserve still gave more attention to nominal interest rates than Friedman wanted, notwithstanding its use of monetary targets.

Part of this attention was manifested in the FOMC's reluctance to make rapid adjustments to the federal funds rate. The inadequate adjustment of the federal funds rate in the face of economic conditions reflected not only the fact that adjustments were typically small but also the fact that they were gradual.[172] Two economists at the Federal Reserve Bank of San Francisco—John Judd and Friedman's former student John Scadding—discussed these issues in a paper planned for circulation to the FOMC in October 1979.[173] Judd and Scadding (1979, p. 23) observed that "the FOMC … [has] moved the [funds] rate only slowly, or by small amounts, when confronted with less than complete evidence that policy should be changed." They added (p. 27) that, in particular, "the FOMC generally has moved its funds-rate operating instrument very cautiously in attempting to achieve [monetary] targets, … [so] funds-rate changes have generally not been large enough nor timely enough to stabilize money growth." In this way, Judd and Scadding concluded that the tactical choice of an interest-rate instrument had had a detrimental effect on the Committee's ability to meet its stated monetary targets.

Volcker acts

Judd and Scadding's paper was external evidence of the fact that there was agitation within the Federal Reserve System in August-September 1979, above and beyond the pressure coming from the traditionally monetarist Federal Reserve Bank of St. Louis, for the Federal Reserve to move away from interest-rate-centered operating procedures. The unsettled state of financial markets in early October 1979, manifested *inter alia* in further dollar depreciation and rising gold prices, amplified the pressure for a change in Federal Reserve policy and helped prompt major actions

[170] For documentation of this point, see, for example, Nelson (2020a, Chapter 9) and Chapter 5 above.
[171] Friedman (1976i, p. 9).
[172] See also the discussion in Nelson (2019) of Allan Meltzer's public activities during 1979 calling for a change in operating procedures and emphasizing the over-gradual nature of the FOMC's interest-rate adjustment.
[173] The plan to distribute the paper was dropped when the change in Federal Reserve operating procedures was announced, and it was instead published in the Federal Reserve Bank of San Francisco's publicly-issued research journal. See Judd and Scadding (1979, p. 23).

and public statements on the part of Volcker and his colleagues.

On October 6, 1979, Chairman Volcker announced a series of new measures, including a change in operating procedures. A Federal Reserve statement issued in conjunction with the announcement indicated that monetary policy "will focus on supplies of bank reserves in trying to control the growth of the money supply instead of, as now, focusing on the federal funds interest rate." (Quoted in *Financial Times* (London), October 8, 1979*a*.)[174]

Friedman's reaction

The centerpiece of the policy change was the shift to a reserves aggregate—nonborrowed reserves—as the Federal Reserve's principal policy instrument. This item, which is discussed at length presently, was, however, announced by Volcker on October 6 as one part of a *package* of measures.

One other element in the package tended to attract the headlines in the immediate wake of the announcement (see, for example, *Dallas Morning News*, October 7, 1979)—a 100-basis-point increase in the discount rate (to 12 percent). Reflecting the change in atmosphere that occurred during the fall 1979 period, this increase reflected a unanimous Federal Reserve Board vote, in contrast to the 50-basis-point increase in September, for which Volcker had only received 4-to-3 voting support from the Board.[175] In Friedman's view, the discount-rate increase received exaggerated attention in the news coverage of the October 6 announcements (*Newsweek*, October

---

[174] See also that day's Federal Reserve press release, printed in Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1979, pp. 44–49) (and also excerpted in *Financial Times* (London), October 8, 1979*b*). This statement indicated (p. 44) that the FOMC's "change in the method used to conduct monetary policy… involves placing greater emphasis in day-to-day operations on the supply of bank reserves and less emphasis on confining short-term fluctuations in the federal funds rate." This passage of the statement was excerpted, with a couple of non-material errors in the reproduction of the quotation, in Friedman (1983a, p. 8; 1985a, p. 54) and was correctly quoted in Friedman (1984a, p. 28).

[175] The contrast between the September and October votes, which Volcker mentioned in his October 6 public remarks, was highlighted in the Associated Press' report on the Federal Reserve's measures. See *Miami Herald*, October 8, 1979. A reported reaction among commercial bankers at the time was that the discount-rate increase was mainly "symbolic" (*New York Times*, October 8, 1979*a*, p. D6). Its perception as a symbolic act may have been due both to the fact that the discount rate had diminished in importance in U.S. monetary policy since the 1960s and to the need to revise the damage to assessments of the Federal Reserve's resolve that had been created by the previous, close-run discount-rate vote. James Meigs, whose reaction to the Federal Reserve's October 6 announcement is discussed further below, conjectured that the Federal Reserve was including a major discount-rate change as part of its package because this element would elevate the importance of the new package in the perception of other countries (in which the discount rate was often the central policy rate). See Meigs' remarks in *San Jose Mercury* (California), October 14, 1979, p. 1E.

22, 1979). And even a Board spokesman stressed to the media on the weekend of October 6–7 that the procedural changes unveiled in the just-announced package had "far more significant" announcements than the discount-rate rise.[176]

A further measure announced on October 6—and another one that Friedman felt got too much attention (*Newsweek*, October 22, 1979)—was the imposition of a marginal reserve requirement of 8 percent on the issuance of commercial banks' managed liabilities—among them such wholesale instruments as marketable certificates of deposit, repurchase agreements, and bank borrowings in the Eurodollar and federal funds markets (*New York Times*, October 8, 1979*b*, p. D8; *Financial Times* (London), October 8, 1979*a*).[177]

Meltzer (2009b, p. 1026) implied that this increase in marginal reserve requirements was a highly restrictive action—a surprising judgment, as that measure was directed at bank liabilities that were *outside* the traditional M1 and M2 definitions and so did not directly bear on the aggregates that Meltzer and other monetarists most emphasized.[178] Karl Brunner's reaction at the time was different from Meltzer's retrospective one—and it matched more closely the expected monetarist reaction. Brunner contended that the marginal reserve requirements suggested a concern with credit control rather than monetary-aggregate control.[179] Volcker's own explanation for the reserve-requirement move focused on credit: banks' wholesale deposit issuance, he suggested, "had financed much of the recent buildup in bank credit.[180] Volcker had earlier indicated that this was the case when he stated that the requirement would be in place "so long as credit expansion is excessive" (*Omaha World Herald* (Nebraska), October 10, 1979, p. 4). Friedman disapproved of marginal reserve requirements and made clear he did not think they

---

[176] See the Associated Press' report in the *Omaha World-Herald* of October 8, 1979—a report that, the Board spokesman's message notwithstanding, made a headline out of the "lending rate hike."
[177] This marginal reserve requirement had some similarities to one in force in the United Kingdom at the time that was known informally as "the corset." The requirement's presence in the October 6 package, and its prominence in the public announcement of the package, were likely what mainly prompted the *Financial Times* (October 8, 1979*a*) to misconstrue the package in these terms: "In essence, Mr. Paul Volcker, the new chairman of the Federal Reserve Board, has switched from a traditional reliance on the level of interest rates to control credit demand to a U.S. version of Britain's banking 'corset.'"
[178] Some wholesale items were included in the revised definition of M2 in 1979−1980, only to be taken out in subsequent redefinitions. (In particular, overnight repurchase agreements and Eurodollars issued by banks were initially included in the new M2 series—see Hafer, 1980, p. 27. Hetzel's, 2008, p. 156, statement that managed liabilities were "not part of… M2" was not fully true of the modern M2 series until 1996.) Wholesale deposits did feature prominently in the redefinition of M3 in 1979−1980, but they were not yet in the M3 series (which was one of the officially-targeted monetary aggregates) as of October 1979.
[179] See the passage in the written submission accompanying Brunner's testimony of December 4, 1979, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1980a, pp. 110−111).
[180] From his October 17, 1979, testimony, in Volcker (1979a, p. 889).

were necessary for what the Federal Reserve should be concerned with: money stock control.[181]

The inclusion of a quantitative measure in the package directed essentially at credit growth rather than the monetary aggregates likely informed Friedman's judgment that the October 6 announcement was "ambiguous" as an expression of the Federal Reserve's determination to improve monetary control (*The Guardian* (London), October 22, 1979). While stopping short of saying that the new reserve requirement would have no effect, Friedman made it clear that he believed that it amounted to an attempt by the Federal Reserve to introduce new quantitative controls on commercial bank expansion, in place of older controls that the banks had been able to bypass (*Newsweek*, October 22, 1979). He summed things up by remarking of the discount-rate increase and reserve-requirement move: "If they were the only two parts [of the package], the whole thing could be dismissed as purely cosmetic." (*Richmond Times-Dispatch* (Virginia), October 12, 1979.)

Accordingly, for Friedman, the major change in the October 6 measures was the shift to the new operating procedures—comprising a focus on bank reserves and a countenancing of larger short-term fluctuations in the federal funds rate, and intended to deliver greater control of monetary growth. "It wasn't spelled out in detail—it was left very vague and very ambiguous," Friedman remarked, "but, if it means that the Fed is going to shift to controlling the money supply through the monetary base, it's of potentially enormous significance." (*Richmond Times-Dispatch* (Virginia), October 12, 1979.)

In the Cambridge/Boston area of Massachusetts that had for so long been a center of opposition to monetarism, a newspaper editorialized on the Federal Reserve's announcement. The editorial noted that, although high nominal interest rates had accompanied inflation for years, and there had been previous instances in which the Federal Reserve attempted to use what seemed like high interest rates as a policy against inflation, the present episode involved quantitative control that was designed to help ensure that the slower monetary growth emerged—"a strategy that monetarists like Milton Friedman have been urging for years." (*Boston Herald American*, October 11, 1979.)

---

[181] See his remarks in *Newsweek*, April 14, 1980. The occasion for these 1980 remarks was the Federal Reserve's later increase in the marginal reserve requirement to 10 percent. This was part of the 1980 credit-controls package (Meltzer 2009b, p. 1050). At the time of the October 1979 announcement, Friedman's former student James Meigs had likewise said that the marginal reserve requirement was "sort of a side issue, a form of selective control" designed to influence bank loans rather than deliver *bona fide* monetary control (*South China Morning Post* (Hong Kong), October 14, 1979).

In line with this sentiment, when taking stock a couple of weekends after Volcker had made the move, the *Los Angeles Times* correctly observed that the truly distinctive part of the package was the move to a reserves-based operating procedure and "letting interest rates jump around with far greater volatility than before." It noted further: "Pressure for such a move has been building for more than a decade, from a growing cadre of economists known as monetarists and led by Nobel laureate Milton Friedman." (*Los Angeles Times*, October 21, 1979, Section 1, page 14.)

The *Los Angeles Times* analysis noted also that Friedman was skeptical with regard to whether a material—and durable—change in operations was going into effect. This skepticism was already evident in public statements he had made before the *Los Angeles Times* article appeared. Speaking in San Francisco shortly after the procedures were inaugurated, Friedman called them a "long overdue change," but he added his caveat that "I remain skeptical until I see proof" that a change of substance in policy procedures had taken place (*San Francisco Chronicle*, October 18, 1979). In the 1980s, Friedman would frequently point to his *Newsweek* column in reaction to the October announcement (*Newsweek*, October 22, 1979) as evidence of his wariness at the time of the announcement of the New Operating Procedures.[182] He cited that column as evidence, in particular, that he had was not very impressed by the announced change (see Idea Channel, 1987). The column did express the hope that the Federal Reserve had indeed turned over a new leaf, but it alluded to the previous occasions (most notably when the FOMC apparently adopted a reserves instrument in 1972) when Friedman had taken at face value an announced change in Federal Reserve procedures, only to find that the change in operating procedures had been illusory and that, in practice, the FOMC was still focusing on the federal funds rate.

Friedman reinforced this point in remarks he made to a reporter: "The Federal Reserve has been very stubborn. On several previous occasions, they have made noises of a similar kind. Each time, they reverted to their former method of operation. The question now is whether they really will carry through on this." (*Los Angeles Times*, October 21, 1979, Part 1, p. 14.)

The new operating procedures and monetarist prescriptions

Friedman's former student, James Meigs, had a longstanding interest in the issues involved in the unfolding 1979 developments. Nearly twenty years earlier, he had produced the Friedman-supervised dissertation work on the money-supply process and on the Federal Reserve's attitude

[182] See, for example, Friedman (1984g, p. 397).

to bank reserves—work published as Meigs (1962). In 1979, Meigs, now an academic based in California, welcomed as the "really important announcement" in the Federal Reserve's October 6 package the move to the reserves-based procedure: "if they are serious about that, it would be a revolution in their procedures—and extremely helpful." (*San Jose Mercury* (California), October 14, 1979, p. 1E.)[183]

Monetarists had reason for taking some satisfaction not only in the move itself, but also in how policymakers articulated the rationale for it—and in particular, in the way in which officials put the decision in the context of money-supply theory. Although the *New York Times* (October 8, 1979*a*, p. D6) noted in the wake of Volcker's announcement that "many economists" saw money-supply determination in monetary-base/money-multiplier terms, it was nevertheless true that, as part of the Federal Reserve fightback against monetarism over much of the 1960s and early 1970s, monetarists had from time to time found themselves accused publicly by central bank officials of having an unsophisticated, textbook-like view of money creation that did not describe reality. Meigs himself had documented, and rebutted, criticisms of this type in his 1972 book *Money Matters*.[184] Within a couple of weeks of the October 6 announcement, Volcker himself publicly endorsed the essence of the money-multiplier approach when he remarked in testimony that "the provision of reserves to the banking system… ultimately governs the supply of deposits and money."[185]

When it came, however, to the *details* of how to proceed in light of the acceptance of the importance of bank reserves for monetary control, differences between monetarists and the Federal Reserve remained. In particular, Friedman would always reject the notion that the Federal Reserve's New Operating Procedures coincided with the particular procedures he had advocated.

---

[183] Within the Federal Reserve System, the Federal Reserve Bank of St. Louis had also had, as already indicated, a long tradition of emphasizing bank reserves and putting forward reserves as the appropriate monetary policy instrument. After the October 6 announcement, the bank's president, Lawrence K. Roos, remarked that it marked the adoption of "what we've been advocating for years… This is a major change of emphasis... [toward] what the St. Louis Fed has [been] preaching." (*St. Louis Post-Dispatch*, October 8, 1979.) Increased attention to reserves-based operating procedures had been a feature of internal analysis within the Federal Reserve System during Miller's tenure (see Meltzer, 2009b, pp. 982, 991–992), and Miller had joked during a visit to the city of St. Louis: "Now, the St. Louis Fed runs the whole thing… We in Washington are trying to do something about it, [by] trying to get control [back] from St. Louis." (*St. Louis Globe-Democrat*, June 15, 1979.)

[184] See Meigs (1972, pp. 158–164).

[185] From Volcker's (1979a, p. 889) testimony to the Joint Economic Committee on October 17, 1979. Similarly, a little over a week earlier, Volcker (1979b, p. 3; p. 35 of the printed version) had stated: "More emphasis will be placed on limiting the provision of reserves to the banking system—which ultimately limits the *supply* of deposits and money—to keep monetary growth within our established targets for this year." (Emphasis in original.)

And, indeed, there were substantial differences between how the Federal Reserve conducted monetary policy starting in October 1979 and the techniques that Friedman wanted them to adopt. One of these differences—the fact that the reserves instrument the Federal Reserve chose to use as its operating target was nonborrowed reserves—was, in itself, a crucial difference. Certainly, nonborrowed reserves differed from what Friedman advocated. Friedman had wanted monetary base or total reserves to be used as the policy instrument (with its values, in turn, varied with the aim of achieving a monetary-aggregate target, such as for M1 or M2).[186] The attraction of base control lay principally in the fact that, as it covered both types of major Federal Reserve liabilities—currency and bank reserves—it had the closest relationship to total Federal Reserve assets. Consequently, base-control procedures involved the simplest instructions, in the formulation of open-market policy, about actions to be taken with regard to the volume of Federal Reserve assets. But Friedman had long granted that, if there were unusual conversions of deposits into currency, it was not appropriate for the Federal Reserve to keep the base constant or growing constantly. Indeed, the Federal Reserve's failure to allow the base to rise to accommodate currency demand had been one of the points on which he and Schwartz had, in their *Monetary History*, criticized its conduct during the early 1930s. Correspondingly, even in the 1980s, when he advocated direct base control most strongly, Friedman indicated (albeit sometimes only in asides) approval of the notion of permitting exemptions to a strict setting of the base.[187]

What he wanted more fundamentally was Federal Reserve control of total reserves. As the 1979 announcement involved a move to control of nonborrowed reserves, not of total reserves, it seemingly fell short of what Friedman wanted. But the Federal Reserve's manipulation of nonborrowed reserves might, under certain conditions, succeed in delivering control of total reserves: because the difference between the two was discount window borrowing, variations in such borrowing could be monitored and nonborrowed reserves accordingly managed with an eye

---

[186] At points especially from the early 1980s onward, as discussed in late chapters, Friedman saw special virtue in the monetary aggregate targeted simply being the base. On this shift in emphasis on his part, see later chapters.

[187] Although Friedman saw merit in a practice in which the Federal Reserve sought to offset, by movements in the monetary base, the implications for the money stock of variations in the currency/deposit ratio, he did not view fluctuations in that ratio as having been a major source of short-run and medium-run shifts in the growth rates of U.S. monetary aggregates, except during financial panics. (See, for example, Friedman and Schwartz, 1963b, p. 46.) That position allowed him to move between recommendations of monetary base control and of control of total reserves in his prescriptions for central banking. Likewise, another monetarist, Allan Meltzer, was prone to treat base control and reserves control almost interchangeably, writing in the immediate aftermath of the Federal Reserve's policy change: "All that the Fed has to do is control the size of its own balance sheet from quarter to quarter and from year to year. That is what control of bank reserves and the monetary base means." (*New York Times*, October 14, 1979. See also Meltzer, 2009b, p. 1027.)

to their implications for total reserves. Indeed, in an early research paper on the New Operating Procedures, Gilbert and Trebing (1981) characterized Federal Reserve policy under that regime as, in essence, entailing a targeting of total reserves—their grounds being that nonborrowed-reserves operating targets were chosen in conjunction with an assumption about the volume of bank borrowings from the Federal Reserve and so implied policymaker aims with regard to the total volume of reserves.[188]

Friedman himself recognized discounting as a fact of central banking, short of major institutional reform like a move to 100 percent reserve requirements. He was also willing to accept that distress lending through the discount window that raised total reserves in the short run was compatible with tight control over total reserves over monthly periods or longer.[189] It was probably with such an arrangement in mind that, in a public statement made in early 1978, Friedman himself actually advocated the adoption of a nonborrowed reserves instrument as an option: in recommending "abandonment of the futile attempt to control interest rates," he proposed that instead "the key operating instrument [be either] the volume of the monetary base or of unborrowed reserves."[190]

The fact that the Federal Reserve chose nonborrowed reserves, rather than total reserves, as its operating instrument in October 1979 was, therefore, not in itself a matter to which Friedman very strongly objected—at first. Correspondingly, even in light of the decision by the FOMC to make nonborrowed reserves—and not a broader balance-sheet item—the targeted series, he described the 1979 change in operating procedures as a "highly desirable" move (*Wall Street Journal,* February 1, 1982). Having made its October 1979 change in operating procedures,

---

[188] Volcker buttressed the notion that the Federal Reserve was concerned with total reserves when he indicated in his Congressional testimony of October 17, 1979, that a reason for the Board's increase in the discount rate as part of the October 6 package was in order that restraint on nonborrowed reserves show up in the behavior of total reserves and "not be offset by excessive borrowing [by commercial banks] from the Federal Reserve Banks" (Volcker, 1979a, p. 889; also in Volcker [1979b, p. 3; p. 35 of the printed version]). On October 15, Volcker had likewise testified: "we shall be focusing on how much reserves we should be providing to the banking system… The more they borrow, the less we will want to provide through [open-market purchases]" (in Committee on Banking, Housing, and Urban Affairs, U.S. Senate, 1979a, p. 7). Volcker, therefore, set out a total-reserves-targeting interpretation of the new techniques publicly in October 1979. It is not the case that he—as was implied by Meltzer (2009b, p. 1027)—waited until February 1980 to do so.
[189] See Friedman (1970i, p. 16c; 1980a, paragraph 17, p. 59 [p. 56 of 1991 reprint]). In addition, in principle, total reserves could be insulated thoroughly (and instantaneously—rather than over time, as Volcker had implied) from the effects of discount window lending by offsetting open market operations. Anna Schwartz (in *The Banker* (London), February 1985) emphasized this point. However, even if such continuously offsetting operations failed to take place, it would be expected that very short-term borrowing activities by commercial banks would recede as a source of variation in total reserves behavior over longer horizons.
[190] From his letter (of January 25, 1978) to Representative Parren J. Mitchell. See Friedman (1978d, pp. 156, 157).

what the Federal Reserve should do, Friedman remarked in early 1980, was stick to it (*Wall Street Week*, Maryland Public Television, January 4, 1980, p. 11 of transcript).

However, other aspects of the Federal Reserve's operating arrangements had the effect, in Friedman's view, to frustrate the close control of reserves and of monetary aggregates that nonborrowed reserves control had the potential to deliver. These aspects included the continuation of a subsidized, rather than a penalty, discount rate, and to be linked automatically to a rate like the Treasury bill rate instead of being subject to discrete, administered changes.[191] But the central criticism Friedman made of the new arrangements was in the seemingly esoteric area, discussed in more detail in later chapters, of reserve accounting.

In essence, the matter at issue here related to the fact that, throughout 1979 to 1982 and until 1984, the Federal Reserve maintained its practice, introduced in 1968, of setting commercial banks' required reserves as functions of commercial banks' deposit liabilities two weeks earlier. For Friedman and other monetarists, this lagged reserve accounting (LRA) scheme was a major impediment to control of aggregate reserves and money. Although, as indicated above, Volcker cast the practice of determining nonborrowed-reserves determination as tantamount to the setting of the level of aggregate reserves, this perceived equivalence was, in an important respect, only an aspiration—one that, though achievable over longer periods, was difficult to turn into a reality in any specific week or month.

The ongoing institutional fact was that reserve requirements were set as a function of commercial banks' deposit levels prevailing two weeks earlier—not on current deposits. Required reserves were, therefore, predetermined. Consequently, in the absence (in this era) of a very substantial stock of excess reserves outstanding in the banking system, the predetermined nature of the level of required reserves under LRA obliged the Federal Reserve to create a certain volume of total reserves in any given period. Its prerogatives at this short horizon were limited to choosing the mix between reserves supplied via the discount window, and nonborrowed reserves, supplied through one form or another of open market operations. Furthermore, the lagged reserve requirement arrangement built in a tendency for the Federal Reserve to validate, rather than counteract, deviations of monetary growth from target through its bank-reserve creation today.

These properties led Friedman to judge that LRA had been "an extremely serious hindrance" to

---

[191] See, for example, *Newsweek*, July 28, 1980, *Wall Street Journal*, January 30, 1981, and Friedman (1982a, p. 117).

short-run monetary-aggregate control in 1979 to 1982.[192] He would zero in on LRA in numerous critiques that he made of the new procedures during the period from 1980 through mid-1982.

The smokescreen interpretation

Within days of the October 6 launch of the New Operating Procedures, Karl Brunner voiced strong skepticism about the sincerity of the announced change: "The Federal Reserve bureaucracy has grown up with interest rates, and they're not about to let the market set them." (*Wall Street Journal*, October 12, 1979.) The FOMC's means of carrying out its new procedures did not altogether dispel this impression, as, in making a policy decision pertaining to the coming intermeeting period, it continued to specify a tolerance range for the federal funds rate (see, for example, Gilbert and Trebing, 1981, p. 8). Friedman objected to the presence of this tolerance range for the federal funds rate and would urge that it be dropped.[193]

In the assessment of Fred Levin, a Federal Reserve Board staff member at the time, this range meant that there was in a sense in which in 1979–1982 the FOMC and the implementers of the FOMC's directives "never gave up control on a day-to-day, week-to-week, month-to-month, of the funds rate." Rather, they routinely assessed what a particular money-stock and nonborrowed-reserves constellation implied for the federal funds rate, and "when that relationship gave results that they didn't like, they fudged it a little," and "they would jiggle with the formula, so as not to come up with a ridiculous target for the Fed funds rate. So it wasn't really controlling nonborrowed reserves or controlling the money stock on a short-term basis." (Fred Levin, interview, March 10, 2014.)

Almost from the very beginning of the New Operating Procedures period, some outside observers went further—and contended that the Federal Reserve never really made a change toward a reserves-based procedure and continued covert management of the federal funds rate.[194] This "smokescreen" interpretation became prevalent to an even greater extent in retrospectives on the regime. But even a participant in economic policy in 1979, Charles Schultze of the

[192] See Friedman (1983a, p. 9). See also Friedman (1984a, p. 28; 1985a, p. 54).
[193] See *Newsweek*, July 28, 1980, and Friedman (1982a, p. 104).
[194] An early remark to this effect was Goldfeld's (1982, p. 148) observation that the October 1979 changes arose "perhaps because of a desire to divert responsibility for high interest rates to impersonal 'market forces.'" It also deserves mention that Judd and Scadding (1979, p. 31) had stated that targeting reserves would reduce the perceived responsibility of the Federal Reserve for the level of interest rates. They had, however, indicated that their view that this would be an improvement in public understanding of the fact that many forces other than monetary policy tended to exert pressures on interest rates.

Council of Economic Advisers, was inclined to interpret Volcker's action along these lines: "I thought it was political genius, in the sense of: [Under an explicit funds-rate regime,] you could never have gotten rates up to what he had to get them to." Schultze added, however, that subsequently he had "said this to Volcker a couple of times, and he strongly says no," rejecting Schultze's rationalization for the 1979 operational shift (Charles Schultze, interview, July 9, 2013.)[195] Volcker himself observed that "obviously, that explanation has always annoyed me. I mean, it's true that, when we went to a tough money supply, a disciplined thing, interest rates were going to go up, and we were always aware of that [with regard to] short-term rates." Subject to that caveat, he was emphatic that these rates were, indeed, market-determined under the new procedures (Paul Volcker, interview, October 16, 2013).

In opposition to the smokescreen interpretation, there is, in addition to Volcker's denial, the fact that the federal funds rate during the 1979−1982 period had the features not only of being frequently high but also of fluctuating greatly (with three separate crossings through the 15 percent barrier, according to the monthly-average data, as well as a period of single-digit values during 1980). The fact that the FOMC stated a federal funds rate range in 1979−1982 did not itself imply that policymakers were, in effect, still administering the rate. For the stated range was a wide one, and Judd and Scadding (1979, p. 24) contrasted the "wide-band federal-funds rate constraint" adopted in the October 1979 arrangements with the close control and cautious adjustment of the federal funds rate that the FOMC had exercised until October 1979.

For his part, although, on occasion, Friedman seemed well disposed toward seeing the New Operating Procedures as a smokescreen behind which the FOMC continued to manage rates, that was not his baseline interpretation. On the contrary, during 1980 and 1981, and through mid-1982, Friedman, as discussed in later chapters, often interpreted U.S. short-term interest rates as market-determined rates and not as the result of explicit choices on the part of the FOMC. And in 1984 he buttressed the notion that 1979 had seen a change in operating regime, when he remarked: "A 'monetary policy experiment' *was* conducted from October 1979 to the summer of 1982."[196]

The monetarist critique and the viability of interest-rate practices

An acceptance of the fact that, in October 1979, the FOMC had changed its operating procedures

---

[195] On Schultze's dialogue with Volcker on this matter, see also Taylor (1995, p. 780).
[196] Friedman (1984g, p. 397, emphasis in original).

did not imply an acceptance of the fact that the change was permanent. And, indeed, Friedman's own perspective on the change was, as noted above, permeated with doubt about its likely permanence. So, too, was the reaction of James Pierce, a former member of the economist staff at the Federal Reserve Board. Although he did not deny outright that a move of substance had occurred in the FOMC's policy procedures, Pierce, speaking in the days after the October 6 shift, did question whether it amounted to a lasting or "real move." Rather, Pierce suggested, "the Fed wants to increase interest rates and doesn't want to be blamed for it" and would, he predicted, revert to the system of targeting the federal funds rate once interest rates peaked (*San Jose Mercury* (California), October 14, 1979, p. 1E).

Pierce's prediction that a peak in interest rates would be followed by a prompt end to the New Operating Procedures was not really borne out. Instead, as already noted, the federal funds rate (measured using its monthly average) moved above 15 percent on three separate occasions during the 1979–1982 period. It is, nevertheless, true that the New Operating Procedures did not last, that the FOMC resumed management of the federal funds rate in the second half of 1982, and that the level of short-term interest rates was thereafter generally in a lower range than had been the case for most of the New Operating Procedures period.

The Federal Reserve itself left the door open for a return to targeting the federal funds rate in its announcement of October 6 when it indicated that its management of nonborrowed reserves was an arrangement instituted "for the time being" (*Financial Times* (London), October 8, 1979*a*). The termination in 1982 of the New Operating Procedures no doubt largely reflected dissatisfaction with the interest-rate volatility associated with those procedures and the traditional central-bank preference, noted by Friedman and by Karl Brunner in the 1979 quotations given above, for managing short-term interest rates. But, as will now be discussed, there was, beyond this, likely a deeper macroeconomic reason for the ephemeral character of the Federal Reserve's adoption of the New Operating Procedures: in the 1970s, there were greater analytical and historical foundations for interest-rate-oriented policies than monetarists tended to concede.

Among those prepared to accept an influence of monetary policy on aggregate demand and prices, there existed, as of 1979, a long historical tradition accepting the interest-rate management as a means of steering economic conditions. Although the modern research literature in favor of interest-rate rules—such as the contributions of McCallum (1981) and Woodford (2003)—had yet to appear, there was available a literature of a past vintage that

advocated interest-rate management for economic-stabilization purposes—most notably Wicksell (1935, 1936) and Keynes (1930).

What was also present in the postwar decades through 1979 was a more informal acceptance in practical circles of the idea that interest-rate management could work as a means of stabilizing or destabilizing the economy. Even hardline Keynesian Seymour Harris had conceded this point, albeit in a backhanded manner, when he testified in 1958: "as far as I know the economic history of this country, it has never been true when we introduced a high-rate money policy that this has not been followed by a recession or a depression."[197]

Harris, as it happened, had been a member of a camp that had more confidence that a high interest-rate policy could dampen output rather than that it could subdue inflation. This perspective was, as discussed in the next section, becoming increasingly rare by late 1979—although it was certainly still present in some of the reactions by economists, other commentators, and members of Congress in that period.[198] Predominantly, the need to raise interest rates to fight inflation was understood by the time Paul Volcker became Federal Reserve chair. For example, during the early months of Volcker's tenure, when the FOMC was still targeting the federal funds rate, John H. Perkins, president of the Continental Illinois Bank and also of the American Bankers Association, observed: "Our essential problem is inflation. If we restrain the supply of money to deal with inflation, we get high interest rates. The alternatives—such as starting the printing presses, mandatory controls, and other approaches—do not solve the problem." (*Chicago Sun-Times*, September 7, 1979.)

Of course, an important element of an appropriately disinflationary interest-rate reaction was likely to be the requirement that real, and not just nominal, interest rates rose in the tightening process. But, by 1979 at least, this aspect of the problem had also become well understood at the policymaker level. Specifically, internal FOMC discussions in the 1978–1979 period did generally show an understanding that real short-term interest rates needed to rise.[199]

In this connection, the critique that Friedman and other monetarists made of the Federal

[197] From Harris' testimony of April 24, 1958, in Committee on Finance, U.S. Senate (1958, p. 2014).
[198] On the reaction of members of Congress on this matter, see Nelson (2005), as well as the ambiguous statement to Volcker at a hearing of October 15, 1979, by Senator Robert Morgan (D–NC): "Mr. Volcker, I'm not sure that I understand where we're going with your high interest rates, but I would agree that you probably had little choice." (In Committee on Banking, Housing, and Urban Affairs, U.S. Senate, 1979a, p. 17.)
[199] See Nelson and Schwartz (2008, p. 845) for a consideration of the FOMC deliberations in this era on this point.

Reserve's pre-1979 policy can itself be criticized for eliding the distinction between the *need for lower monetary growth* and the need for *new operating procedures*. As we have seen, they regarded the latter as helping accomplish the former, because they felt that short-term interest rates were being adjusted too sluggishly to deliver successful monetary control and noninflationary monetary growth. This begged the question, however: Could not the Federal Reserve have simply kept the federal funds rate as an instrument and resolved to adjust it more promptly in response to economic conditions? After all, episodes that Friedman had referred to generally favorably—as cases in which monetary policy provided an acceptable average economic performance—included the 1920s and 1950s decades in the United States and the experience after 1973 in Japan. These instances had not been associated with an abandonment of an interest-rate instrument. Instead, the central bank had adjusted the interest rate in such a way as to secure noninflationary monetary growth rates.

Friedman emphasized in his August 20 *Newsweek* column, after Volcker's ascension, the need for a reform of Federal Reserve operating procedures—specifically, one that went in the direction of dropping the federal funds rate as the Federal Reserve's policy instrument. He recognized that the Federal Reserve had not targeted the federal funds rate for its own sake, but with other economic objectives in mind. As already indicated, Friedman acknowledged, in particular, that federal funds rate decisions during the 1970s had been guided by monetary-aggregate growth targets.[200] He also granted that achievement of these targets was in principle compatible with the central bank's employment of an interest-rate instrument—so that the choice between short-term rates and reserves as a policy instrument was, in principle, a choice concerning tactics, not strategy.[201] Friedman even, on occasion, referred to the scope available to improve monetary-growth control in the context of the existing operating procedures. In so doing, he was implicitly indicating that the FOMC could formulate a more stabilizing interest-rate reaction function than the one they were so far employing.[202] Friedman and other

[200] See the discussions in previous chapters, as well as specific Friedman items such as Instructional Dynamics Economics Cassette Tape 52 (June 10, 1970), Friedman (1970i, 1971c), and *Newsweek*, December 8, 1975.
[201] See Friedman (1971c, p. 26; 1980a, paragraphs 10 and 14, pp. 57, 58 [pp. 53 and 54–55 of 1991 reprint]) and Instructional Dynamics Economics Cassette Tape 179 (October 1975, Part 2), as well as the discussion in Nelson and Schwartz (2008, p. 849). Prior to the late 1970s, the recognition at the U.S. policymaker level that the real interest rate likely had likely been rendered unduly low by inflation was marred by policymakers' view that the appropriate relationship between nominal interest rates and inflation could be restored by the deployment of nonmonetary instruments against inflation. See previous chapters as well as Nelson (2020b, Chapter 15) and DiCecio and Nelson (2013, pp. 406–407).
[202] For example, in mid-July 1976, in Instructional Dynamics Economics Cassette Tape 195 (July 1976, Part 1), Friedman suggested that improved monetary control was possible even under "their present and unnecessarily imperfect techniques."

monetarists felt, nevertheless, that the interest-rate instrument choice was very prone to have the effect of limiting the Federal Reserve's achievement of its monetary targets, so that the choice of tactics had contributed to the failure by the authorities to achieve their monetary strategy.

Meltzer (2009b, p. 1017) contended that monetarists grasped the point that a successful interest-rate policy—one that was stabilizing with regard to economic outcomes—was feasible, but that "they did not emphasize the last point and insisted on the importance of controlling money directly." This characterization applies well to Friedman. In retrospect, it appears appropriate to regard Friedman as having been too skeptical of the possibility of delivering stabilizing interest-rate rules in practice, even though he did not claim that this was inherently unachievable. He would then be caught off-guard by the extent to which the Federal Reserve, after 1982, was able to reconcile what he regarded as outmoded central bank practices, like interest-rate management, with the stabilization of real activity and inflation.

III. PERSONALITIES, 1979

PAUL VOLCKER

Even in 1979, however, Friedman was able to keep strategy and tactics sufficiently separate in his thinking about U.S. monetary policy for him to see that, in a realm basically distinct from the issue of appropriate operating procedures, there were important aspects of policy strategy—in the analysis of the reasons for, costs of, and solution for inflation, and of the relationship of inflation both with interest rates and with real variables—that needed to change from past practices, in order for successful disinflation to occur. Paul Volcker's becoming Federal Reserve chair provided an opportunity for this to happen. In important respects, by 1979, Volcker's thinking on these issues overlapped with Friedman's own.

Interactions between Volcker and Friedman

When, in the spring of 1974, Volcker's departure after more than five years at the U.S. Treasury was announced, the Associated Press noted: "Although Volcker is not widely known in the United States, he is well known in international monetary circles…" (*Washington Star-News* (Washington, D.C.), April 9, 1974.) The specialized nature of Volcker's eminence was also alluded to more than five years later when, at Volcker's swearing-in as Federal Reserve chair, President Carter observed, "Internationally, Paul Volcker is well known," while adding that "Mr.

Volcker is a man who has devoted his entire professional career to dealing successfully with the complexities of monetary theory and practice and international finance."[203]

By mid-1978, as Friedman recalled it, he had known Volcker "for many years."[204] It was in the course of the Volcker activities that Carter referred to in the field of international finance—during Volcker's tenure in the Nixon Administration as Under Secretary of Monetary Affairs from 1969 to 1974 (see, for example, Europa Publications Limited, 1986, p. 1663), in practice a position largely concerned with the international monetary system—that Friedman first met Volcker. Having left that position, Volcker was back in public office before long—this time mainly concerned with *domestic* monetary and financial issues—as president of the Federal Reserve Bank of New York starting in 1975. With regard to Friedman, Volcker recalled that during his bank presidency, "I met with him a few times when I was in New York [and Friedman was visiting the city]. He was always mad at the Federal Reserve." (Paul Volcker, interview, October 16, 2013.)

Beyond their discussions of current policy developments, Friedman and Volcker had an exchange in mid-1978, when Friedman wrote to the bank president to ask permission to film, for the *Free To Choose* series, a sequence in the Federal Reserve Bank of New York's gold vault.[205] Volcker recalled that, in Friedman's proposal, "he had a video [that is, a television crew], and he wanted to take a picture of the gold vault." Volcker indicated that "I wouldn't let him. And he got very annoyed with me (*laughter*), because I didn't give him the great privilege of [agreeing to the *Free To Choose* camera crew] photographing him in our gold vault so he could talk about the Gold Standard." As for the reasons for his refusal, Volcker observed: "Oh, I just thought, you know, we can't—we're not going to make a special deal for Milton Friedman, of all people. He could go down and *visit* the gold vault. He just couldn't take a crew down there and photograph it and use it as a prop while he was criticizing Federal Reserve policy. (*laughter*)." (Paul Volcker, interview, October 16, 2013.)[206]

---

[203] In Carter (1979e).
[204] Friedman and Friedman (1998, p. 486).
[205] See Friedman and Friedman (1998, pp. 485–487).
[206] The Federal Reserve Bank of New York's disclination to allow filming in the gold vault paralleled the situation faced in the mid-1960s by the makers of the James Bond film *Goldfinger*, who were denied permission to film inside Fort Knox's gold vaults or take photographs of the interior for research purposes (*Evening Capital* (Annapolis, Maryland), December 19, 1964). Another connection between Friedman and *Goldfinger* arose through the television series *Yes Minister* and *Yes, Prime Minister*, screened in the United Kingdom during the 1980s. Actor Richard Vernon, who guest-starred a few times in the two series, played a character who was ultimately (in the 1987 *Yes, Prime Minister* episode "A Conflict of Interest") appointed governor of the Bank of England. In *Goldfinger*, Vernon had played a senior Bank of England official. The coauthor of all the episodes of both series was the *Free*

When reminded that he ultimately *did* grant permission for Friedman and his crew to film some footage on the bank premises, Volcker replied. "I think maybe. I don't think of the gold vault, [though]." (Paul Volcker, interview, October 16, 2013.) In the event, Friedman's account in *Two Lucky People* stated unambiguously that the location filming included "a scene filmed in the gold vaults of the Federal Reserve Bank of New York" and, in quoting a thank-you letter he wrote to Volcker in 1978, implied that he and his team may have filmed in both the gold vault and the meeting room of the bank's board of directors.[207]

It appears that both Volcker's and Friedman's recollections were each correct to some extent. The *Free To Choose* episode on the Great Depression had footage of Friedman in the bank's board room and also of Friedman standing *just outside* the bank's gold vault, but not within the gold vault itself—a situation that necessitated him telling viewers: "Inside is the largest hoard of gold in the world."[208] So Friedman did not actually get to stand before the cameras amid the gold holdings and so use them directly as an on-screen backdrop. Those holdings, as it happened, became even more valuable in between the time of Friedman's filming the sequence in 1978 and the broadcast of it in 1980: the annual-average price of gold was $193 per ounce in 1978, rose to $306 in 1979, and reached a twentieth-century peak of $615 in 1980.[209]

As Federal Reserve chair, Volcker would be regarded by contemporaneous and retrospective commentaries alike as putting Friedman's ideas into practice, particularly during his early years in office. But it should be stressed that Volcker was by no means someone who professed to know the chapter and verse of Friedman's writings. And although, as discussed below, he did absorb many key points Friedman had advanced, and his policies reflected this absorption, he had many disagreements with Friedman on many specifics of monetary economics. In addition to having much divergence with Friedman on normative matters, Volcker also did not have a very favorable view of Friedman's empirical work on money demand. Volcker recalled that, when he was a staff economist at the Federal Reserve Bank of New York in the 1950s, he was

---

To Choose series' creative supervisor, Antony Jay, who recalled that the fact that Vernon played a senior Bank of England official in both *Goldfinger* and *Yes, Prime Minister* was not intentional, adding: "Of course, he was the ideal kind of character [actor] for that." (Sir Antony Jay, interview, May 29, 2013.) In one of Vernon's appearances in *Yes Minister* ("The Quality of Life," broadcast March 30, 1981), his dialogue included one of a couple of mentions that Friedman received in the series.

[207] Friedman and Friedman (1998, p. 486).

[208] *Free To Choose*, PBS, Episode 3, "The Anatomy of Crisis," January 26, 1980, pp. 1 and 4 of transcript (quotation from p. 4). As for the use of the board room: By 1978, meetings of the Federal Reserve Bank of New York's board were not central in monetary policy. But they were had played a more important role in the interwar period with which the "Anatomy of Crisis" episode was concerned.

[209] See *https://nma.org/wp-content/uploads/2016/09/historic_gold_prices_1833_pres.pdf*.

asked to analyze a study of velocity that Friedman had written. Volcker's memory of this exposure to Friedman's analysis was not a favorable one: "I remember I first, you know, had an intellectual 'meeting' [with Friedman], if that's the right word" when carrying out that analysis. "And my memory is I was given a copy of his great opus [written] with his partner. And they [the bank hierarchy] said, 'What do you think of this?' And I looked at it, and I said I didn't think much of it. But what I remember about it… is that he concluded that money was a luxury good, in effect—and that the velocity of money circulation would decline, you know, as a matter of long-term trend… But no sooner did he say that than the velocity then began increasing." (Paul Volcker, interview, October 16, 2013.)

Indeed, this negative impression of Friedman's predictive power was something that Volcker would affirm at a Federal Open Market Committee meeting during his period as chair. In the course of a meeting session held on July 9, 1986, after a fellow Board governor had been talking about the early postwar behavior of U.S. monetary velocity, Volcker remarked: "That's when Milton Friedman wrote his great tome saying there was an inexorable secular decline in velocity." Volcker then added caustically: "At which point, it rose from 2 to 4."[210]

Volcker left his Federal Reserve staff position to work at the Chase Manhattan Bank as an economist in the period 1957−1962 (Europa Publications Limited, 1986, p. 1663). It may be that his recollection of studying the Friedman piece on velocity actually pertained to an experience while in the latter position, rather than at the Federal Reserve. In any event, it is likely that the Friedman study that Volcker scrutinized was a version of Friedman's 1959 demand-for-money study or perhaps a draft section of the Friedman-Schwartz *Monetary History*.[211] Indeed, Volcker's description of the Friedman manuscript had similarities to arguments laid out in Chapter 12 of the *Monetary History*, "The Postwar Rise in Velocity," in which the authors examined the velocity rise of the 1940s and 1950s and suggested that it was unlikely to continue.

There may, however, be a semantic issue involved in Volcker's conviction that Friedman was proved wrong by events. M1 velocity indeed continued to rise in the 1960s and 1970s, and an M1-type definition of money was the money-supply concept most emphasized by the Federal Reserve through about the mid-1980s. Friedman and Schwartz, however, were concerned with an M2 concept. And M2 velocity did not rise during the 1960s and over most of the 1970s. It was, instead, largely trendless in the 1960s and, as discussed below, into the 1970s. Indeed, as

[210] Federal Open Market Committee (1986, p. 46).
[211] The former item was Friedman (1959).

discussed in Chapter 3 above, Friedman actually took pride in the Friedman-Schwartz prediction that velocity's rise (evident in the first decade after World War II, regardless of the definition of money) would cease in the case of M2 (see Chapter 2 above). That said, Friedman's solo work and Friedman and Schwartz's joint analyses in the 1950s and 1960s were indeed predicated on a belief, which they had repudiated by the end of the 1970s, that the income elasticity of M2 was well above unity.[212] Thus, as Volcker implied, their analysis in the 1950s and 1960s suggested that money was a luxury good and pointed toward a mild declining trend in M2 velocity for the 1960s and 1970s. And this decline, indeed, did not materialize.[213] It was only really in the early 1970s that Friedman embraced a model of money demand that did not imply a trend in M2 velocity arising from growing real income.

The trendless character of M2 velocity was well enough established that Robert Gordon saw fit to refer to it in a January 1980 retrospective on macroeconomic developments in the 1960s and 1970s.[214] With regard to the definition still in use in 1979, however, an important qualification was in order: that series' velocity had risen about 2.1 percent per year in the second half of the 1970s (that is, the period 1975:Q1−1979:Q4) (see Simpson, 1980, p. 105). Friedman himself recognized this fact in his *Newsweek* column (August 20, 1979) heralding Volcker's tenure, when he plotted the trend lines of M2 growth and inflation since 1960 and noted "the steeper trend in inflation than in money." Some of this discrepancy was due to the productivity-growth decline. But part of it was due to the increase in M2 velocity from 1975 to 1979—something that Friedman indicated was "no mystery," as it reflected Americans' rational decision to move out of monetary assets in the face of ongoing inflation. As discussed in Chapter 8, much of the flight out of M2 to which Friedman referred was into assets then outside M2—such as deposits at thrift institutions and shares in money market funds—whose interest rates were more closely linked to market rates. When these assets were included in the redefined M2 series in early 1980, the new M2 had a velocity that was largely trendless since the mid-1950s and, in particular, exhibited a much smaller increase since 1975 (see Simpson, 1980, p. 105).

From Miller to Volcker

For velocity, therefore, whether the inflationary environment had imparted an upward trend

---

[212] See Nelson (2020b, Chapter 12) and Chapter 2 above.

[213] Friedman (1960a, p. 91) laid out his money growth recommendation on the assumption of a 1 percent decline in velocity.

[214] Gordon (1980, p. 125). Gordon gave the "remarkable constancy" of M2 velocity as lasting until 1977 (p. 125) while also stressing that he was referring to the pre-1980 definition of M2 (p. 101).

depended on the specific time series used. This was not the case, however, for another variable: U.S. market interest rates. Whichever interest-rate series one considered, an upward trend in nominal rates was unmistakable by the end of the 1970s.

By late 1979, the upward trend in interest rates on longer-maturity U.S. government bonds was reaching an especially notable watershed. The longer-term Treasury securities market had been placid in 1976 and 1977 and into early 1978, even as Friedman had increasingly warned about coming double-digit inflation. Indeed, in December 1977, the average value of the ten-year secondary Treasury security rate was, at 7.69 percent, actually below the average value prevailing in December 1975. As late as September 5, 1979, Miller's successor Paul Volcker was able to testify that longer-term interest rates had not risen much during the Federal Reserve's tightening.[215]

Bearing Volcker's testimony out, the average ten-year rate had, in August 1979, averaged 9.03 percent—virtually the same level as that prevailing in December 1978. But, from late summer 1979 onward, the situation changed at a rapid pace. Much of the rise in longer-term rates that then occurred—shown in Figure 1—amounted to a rise in expected long-term inflation—which had "picked up markedly" by the end of 1979 in the judgment of Levin and Taylor (2013, p. 238) on the basis of a decomposition of long-term rates (see also Ang, Bekaert, and Wei, 2008) and an examination of other measures of longer-term inflation expectations.

This was a distinctly different situation from the earlier period of double-digit inflation in 1974–1975. To be sure, bond rates had risen considerably in the mid-1970s, but they had nevertheless implied an expectation in the bond market that conditions close to price stability would be resumed within a few years. With the late-1979 data in hand, Charles Nelson's judgment was that, over the second half of the 1970s, "the yield curve… sort of broke loose… The level [of the curve] broke loose. Whereas, before, the long end of the yield curves seemed very well anchored." (Charles Nelson, interview, September 9, 2013.)

The breaking loose was a development acknowledged by the U.S. Treasury when it marketed a new long-term bond in the fall of 1979. In his September 5 testimony, Volcker, while referring to the constancy of long-term rates, had also contrasted that "sitting here in 1979," it was a considerable contrast in the atmosphere with twenty years earlier: "1959, when one could assume

[215] See Volcker (1979d, p. 740).

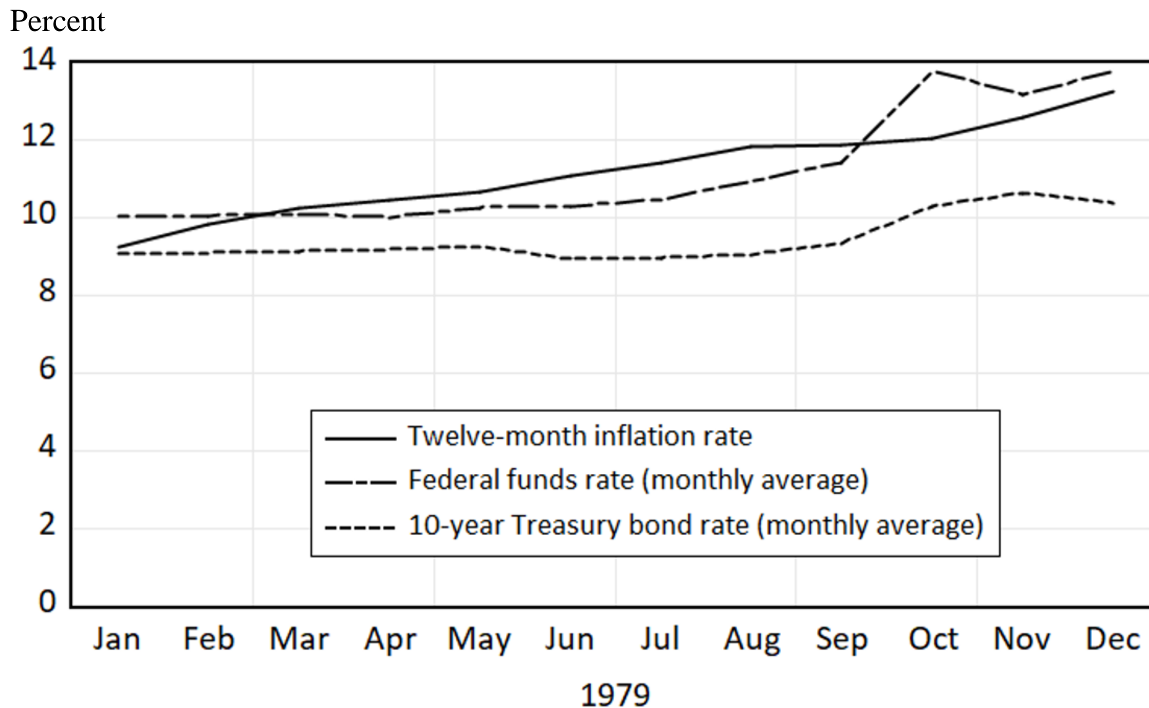

Figure 1. CPI inflation, federal funds rate, and U.S. Treasury ten-year bond rate, 1979.

a fairly decent record in price stability, [and] one could assume that people did not expect big changes in prices and a big generalized inflation."[216] In fact, as already noted, the year 1959 had been characterized by fears of upcoming notable inflation.[217] But whereas in 1959, sizable inflation had amounted to a highly exaggerated fear, in 1979 it was a reality.

Furthermore, even the degree of inflation feared in 1959 was small in scale compared with both actual and expected inflation in 1979. This contrast was reflected in the U.S. Treasury's behavior with regard to bond issuance in the two periods. In October 1959, it acknowledged inflation fears by issuing a high-coupon longer-term bond. These securities became known as "Magic Fives," on account of their roughly five-year maturity and their 5 percent stated interest rate (*Capital Times* (Madison, Wisconsin), October 27, 1959), the latter being the highest coupon rate on a Treasury bond since 1921. In contrast, on October 11, 1979, the Treasury issued a long-term bond bearing a coupon rate above 10 percent for the first time (*Kansas City Times*

[216] From Volcker's testimony of September 5, 1979, in Committee on the Budget, U.S. House of Representatives (1979, p. 298).
[217] See Romer and Romer (2002a) and Nelson (2020a, Chapter 10).

(Missouri), October 12, 1979*a*). The secondary market's ten-year Treasury rate also crossed 10 percent on a monthly-average basis in October 1979 and would stay in double digits for several years.

The rise in the ten-year rate reflected, of course, not only the increase in inflation expectations but also the monetary policy tightening under Volcker. Likewise, the rise to 9 percent under Miller had partly reflected the considerable monetary policy tightening under Volcker's predecessor. Volcker, indeed, expressed the element of continuity with Miller when he testified on October 17, 1979 (Volcker, 1979a, p. 889): "In one sense, the Federal Reserve actions announced on October 6 were part of a continuing effort to maintain control over money and credit expansion. Our basic targets were not changed." Volcker was following the same monetary targets for 1979 that Miller had pursued, and the federal funds rate had already been rising under Miller.

Indeed, as stressed in Chapter 8 above, the growth rate of M2 had come back into single digits during Miller's tenure, in the wake of the second monetary explosion of the 1970s. This was a fact in which Miller took pride. As he observed in the mid-July hearing held shortly before his departure from the Federal Reserve was announced: "In March 1979, one year after I joined the Fed, the growth rate of the monetary aggregates was slower." Miller added immediately with regard to that remark: "Even the [Federal Reserve Board] staff is nodding"—a less-than-subtle reference to Miller's continuing problems in developing a solid relationship with his staff economists, some of whom were in the audience at the hearing.[218] Lyle Gramley, who had moved from the Board to membership of the CEA by the time of Miller's tenure as chair, kept in touch with former Board colleagues and recalled, with regard to their impressions of Miller, "Yeah, I heard stories. (*laughter*)… [They were] not very favorable." (Lyle Gramley, interview, June 24, 2013.)

Miller, having already had his public reputation damaged by Federal Reserve Board dissension over discount-rate decisions in 1978 (see Chapter 8), encountered further public criticism during 1979 as inflation proceeded. Miller was rebuked heavily in the media on the basis of economic developments and on his perceived shaky command of issues related to monetary policy, with such commentaries appearing not only in the specialized financial press but also in other outlets, with conservative commentator William Safire proclaiming in his *New York Times* and

[218] From Miller's testimony of July 17, 1979, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1979b, p. 73).

syndicated column that Miller "has been… a disaster." (*Kansas City Star* (Missouri), June 5, 1979.) For his part, Friedman referred to Miller directly very little in his own public comments during 1979.

Although critical of the uneven way in which monetary policy had been tightened under Miller, Friedman had reason to be pleased with various other aspects of the Miller regime. A number of statements that Miller made during 1979 were along the same lines as Friedman had given over the years. For example, in Congressional testimony given in February, Miller made the case for continued aggregate restraint as follows: "I think we have to have the persistence, the discipline, the willingness to pursue austerity for a period, in order to make up for our past excesses. There can't be a free lunch in this process; we just have to pay the piper for what has happened over 12 years."[219] And, in making policy prescriptions outside the field of monetary policy, Miller seemed largely on the same page as Friedman: Miller urged restraint in government expenditure, and in mid-July 1979 told his Congressional interlocutors that the Carter Administration should "decontrol oil prices immediately."[220]

By this late stage of his tenure, Chairman Miller had gone through a notable period in which he was subject to criticism by other economic arms of the federal government. In early 1979, when—in contrast to its opposition to interest-rate increases the FOMC took under Burns—the Carter Administration urged, in a semi-public manner, that Miller pick up the pace of interest-rate increases: the London *Financial Times*, for example, referred to "recent public disagreement over interest rates between Treasury and Federal Reserve officials" (April 23, 1979), and Paul Samuelson also mentioned the dispute in his *Newsweek* column (April 30, 1979).[221]

Charles Schultze recalled that, in that period, "Mike Blumenthal, the Secretary of the Treasury, and I were two of the people giving him flak." Blumenthal presented Miller with a memorandum giving his and Schultze's arguments for a tighter monetary policy (*Washington Post*, May 6, 1979). Schultze observed that his own estimation at the time was that "the economy was actually getting to the point where it could be overheated—which had not been true until then. And, taken together with oil-price problems, we thought that was dangerous, and

that the Fed [should tighten more]." In contrast, Schultze noted, "Miller probably had a more pessimistic GDP economic forecast, etc. But, in any event, we were pretty sure he was already too easy. And we kind of leaked this out [to the media]. And you didn't have to go very far to figure who and where the leaks were coming from. So both of us got a memo, [with a note by President Carter] in the margin saying, 'You just leave Miller alone.' So I remember that. So, when you're talking about too much flak on Miller, I know where some of it came from." (Charles Schultze, interview, July 9, 2013.)[222]

It was this brief episode in which the Carter Administration urged that Miller tighten policy at a more rapid pace, that likely helped cement the misconception (already discussed in Chapter 8) that Miller eased monetary policy or reduced the federal funds rate during his tenure. Miller certainly contributed to the myth that he cut interest rates as chairman by publicly foreshadowing imminent interest-rate increases that did not, in fact, come about.[223] In July 1978, for example, he had remarked: "I said yesterday that I believe the interest rates will peak between now and the end of the year, and that, next year, we could see a reduction in interest-rate pressures. I continue to believe that…"[224] In contrast, the trajectory of the federal funds rate under Miller was decidedly upward-sloped. In December 1978, the federal funds rate reached a monthly average above 10 percent for the first time since 1974. And, in July 1979—Miller's last full month heading the Federal Reserve—the average federal funds rate was, at about 10.5 percent, over 250 basis points above its level of a year earlier.

Volcker, vice chairman of the FOMC during Miller's tenure, attended almost all of the FOMC meetings at which Miller presided and mostly voted with Miller at the meetings, even though he favored a more rapid increase in the federal funds rate than that Miller put forward. The gap between their views became more a matter of public record, however, when Volcker actually dissented from the majority FOMC vote on two occasions. At the FOMC meeting held on March 20, 1979, Volcker and three other Committee members voted for a "somewhat more restrictive policy posture" than that implied by the slight increase in the federal funds rate for which the majority had voted (Federal Open Market Committee, 1979a, p. 416).[225] Volcker also

[223] For further discussion of Miller's position on making projections of interest rates, see Nelson (2005, 2021).

[224] From Miller's testimony of July 28, 1978, testimony, in Committee on Banking, Finance and Urban Affairs, U.S. House of Representatives (1978d, p. 64). By the middle of the following year, Miller had sworn off predicting interest rates, and when asked to do so in a session with journalists, he joked: "When[ever] I do, reporters all leave the room to call the brokers, and that breaks up the press conference." (*St. Louis Globe-Democrat*, June 15, 1979.)

[225] It was unusual in FOMC meetings in the 1970s for the vice chair to enter a dissenting vote, but not unprecedented when Volcker did so. Notable earlier occasions were dissents by then-Federal Reserve Bank of President Hayes in

dissented at the next meeting four weeks later (Federal Open Market Committee, 1979b, p. 491). His dissents occurred in the time during which Carter Administration figures were also urging a sharper increase in rates. This same period corresponded, ironically, to one of the rare times when Friedman would likely have favored Miller's monetary policy position over Volcker's, as Friedman believed that a too-rapid tightening (as measured by monetary growth) had recently occurred and that monetary growth should be raised above its recent rates (see Section I above).

By the time Miller decided to leave the Federal Reserve the following July, he and Volcker were again allies in FOMC votes, and Miller favored Volcker as his successor. When Miller departed the Federal Reserve, it was not, as some revisionist accounts implied, an ignominious easing-out but, instead, a move to one of the most prestigious positions in the executive branch. In becoming Secretary of the Treasury, Miller received what was widely perceived at the time as, in effect, a promotion. Indeed, Federal Reserve Board staff in the summer of 1979 were blindsided by Miller's departure, as Robert Solow recalled. From what was said to him by "friends or former students on the [Board] staff, in conversation," Robert Solow noted that "they thought that it was shabby, and contemptuous of the Fed, to take that job [as chair], and then just leave it right away—even to be Secretary of the Treasury." The fact that Miller "became a member of the Federal Reserve Board, and left it almost immediately when he got a better offer, as he thought a better offer to be Secretary of the Treasury [to be]—I think [in doing that] he did a lot of damage to the morale of the Fed. And one of Paul Volcker's achievements, while maybe not as important as some of the others, was to restore morale to the staff of the Federal Reserve." (Robert Solow, interview, July 7, 2014.)

The growing acceptance among commentators in the late 1970s that inflation was a monetary phenomenon meant that Miller often received the blame for the double-digit inflation that came about during his tenure. Retrospective accounts have typically assigned even more responsibility to Miller for high inflation. As emphasized in Chapter 8 and in the discussion above, that judgment seems misplaced, as the breakout of inflation that occurred during Miller's incumbency probably reflected, in large measure, monetary policy actions taken in 1976 and 1977, before he became chairman. For his part, Friedman acknowledged that monetary growth had been brought down in 1978 and that the early 1980s disinflation could therefore be traced in part to the monetary tightening that commenced under Miller. And in a discussion that Friedman

the FOMC meetings of January and February 1972. See Federal Open Market Committee (1972b, p. 8; 1972c, pp. 8–9). Hayes' dissent was mentioned by Friedman in Instructional Dynamics Economics Cassette Tape 99 (May 17, 1972).

had with his friend in Michael Mork in April 2006, the month after Miller's death, Miller's record as Federal Reserve Chairman came up. A chart of M2 growth that Mork had prepared reminded Friedman that Miller had overseen a major reduction in monetary growth. Friedman remarked that a reevaluation of Miller's record was required that gave Miller due recognition for his part in the early-1980s disinflation. (Michael Mork, personal communication, May 8, 2013, and October 30, 2013.)

Miller's successor Paul Volcker likewise regarded Miller's tenure as having positive attributes. "You know, from my perspective—I was in New York then—he *was* too easy. (*laughter*)… [But] he wasn't terrible. You know, he was an intelligent man—and did a number of things: [among them,] he shepherded [to Congressional approval] the Monetary Control Act [of 1980] for a while, while he was there. And, administratively, in the Federal Reserve, I think he did a pretty good job… [So] the [overall] feeling that he was a weak chairman was a little bit unfair." (Paul Volcker, interview, October 16, 2013.)

But while Miller's tightening of monetary policy in the second half of 1978 had provided some foundations, it was when Volcker became chair that a major change in the perspective on, and direction of, U.S. economic-stabilization policy was really in the offing. This helped put into practice policies that reflected a sentiment that Volcker had made in early 1977 (Volcker, 1977, p. 25): "In a sense, the long run of which the monetarists speak has caught up with us."

Resolve against inflation

Friedman had observed in late 1973 that, at some point in the decade ahead, the American public would get so fed up with inflation that it would countenance a long recession to restore price stability (Instructional Dynamics Economics Cassette Tape 136, December 13, 1973). At a dinner during mid-1979 with William F. Buckley and John Kenneth Galbraith, held at Galbraith's summer home (which, like Friedman's was in Vermont), Friedman suggested that the United States might have, indeed, reached a point at which a disinflationary policy might prove sustainable. Friedman told Buckley and Galbraith that his grounds for believing this was that inflation was hurting everyone and that the U.S. citizenry had come to resent it more than it did unemployment, especially in view of widespread recognition that the natural rate of unemployment had risen and that the hardship associated with being unemployed was typically less than it had been in the 1930s. (*Daily News* (New York), November 7, 1982.)

But if a multi-year disinflationary policy was now more feasible, what form should it take? In a *Newsweek* column during this period (June 18, 1979), Friedman suggested that President Carter should ask Congress to pass a law requiring that the Federal Reserve strictly follow a multi-year program of reductions in monetary growth. That, of course, did not happen. But Volcker did, in effect, unilaterally introduce a multi-year, monetary-policy-focused attack on inflation. The multi-year aspect of it was largely unwritten.[226] But Volcker laid out his intention of moving to price stability by continuation of disinflationary monetary policy settings: "I think we're going to have to exercise our efforts to restrain growth in money and credit indefinitely."[227]

In the process of U.S. economic policy reaching this point, there were relevant factors going beyond the fact that public opinion that had, indeed, changed in a crucial manner. In particular, and very crucially, it was also the case that the Federal Reserve's thinking about the inflation process had undergone an overhaul. Volcker would come to recall the October 1979 changes in the following way: "We said, in effect, that the United States was experiencing high inflation that needed to be dealt with and that inflation is a monetary phenomenon."[228]

Resolution of the cost-push dispute

The corollary of the Federal Reserve's acceptance of inflation as a monetary phenomenon was a repudiation, on its part, of the cost-push views of inflation that until 1979 been prevalent in the Federal Reserve leadership. As discussed below, this shift at the Federal Reserve mirrored a similar change underway in the economics profession at the time. Nevertheless, the shift took place at the policymaker level of the U.S. central bank even as cost-push views remained pervasive in the nation's executive branch. For, as the Federal Reserve tightened policy during 1978 and 1979, the Carter Administration articulated the view that inflation could be fought by nonmonetary devices as well (Romer and Romer 2002b; Nelson, 2005). So an irony is that, even though Friedman in his June 1979 *Newsweek* column had suggested that the way to secure a monetary policy-centered disinflation program was to strip the Federal Reserve of its monetary policy independence, it was the independence of the Federal Reserve that allowed it to launch

---

[226] To some extent, the requirement that the Federal Reserve gradually move to price stability was already embedded in laws discussed in Chapter 8: the Federal Reserve Reform Act of 1977 and the 1978 Humphrey-Hawkins legislation.
[227] From Volcker's testimony of October 15, 1979, in Committee on Banking, Housing, and Urban Affairs, U.S. Senate, 1979a, p. 26).
[228] Volcker (1994, p. 146).

under Volcker a disinflationary program that was based on a perspective on inflation's causes that ran against the grain of that to which the Carter Administration subscribed.

In 1979, the administration continued to articulate a cost-push perspective both through its policy proposals and its public analyses of inflation's causes. With regard to the former, having already introduced wage guidelines in 1978, President Carter attempted to put his incomes policy on a more formal footing by detailing, in January 1979, a tax credit that would be given to firms that kept nominal wage increases below 7 percent a year (*Manchester Union Leader* (New Hampshire), January 30, 1979). The scheme—the "real wage insurance" scheme that was discussed in Chapter 8 and was based on "tax-based incomes policy" ideas—was not adopted into law. The fact that it was advanced is, nevertheless, notable as the proposal exemplified the administration's continuing adherence to wage-push perspectives on inflation that was rapidly becoming rare in academic circles, in financial markets, and in the Federal Reserve.

In testifying in favor of the real wage insurance scheme, then-Secretary Michael Blumenthal did recognize demand restraint as *one* of the necessary conditions for inflation control, while also being emphatic that such restraint was insufficient: "We are dealing with a specific problem of wage-price momentum for which all the old ideas have proved inadequate."[229] He added: "We need this new tool, and we need it as soon as possible."[230] In the same vein, testifying the following day Charles Schultze stated: "Under present circumstances, clear standards for private wage and price behavior are needed as a complement to fiscal and monetary restraint."[231] These statements bore out the observation made at the start of the year by *New York* magazine that the monetary perspective on the current inflation's causes, "mainly developed by Nobel laureate Milton Friedman, is taken very seriously within financial circles here and abroad but these days it mostly seems to get just lip service in Washington." (*New York*, January 8, 1979.)

As if to confirm this assessment, at the end of January 1979 Secretary of the Treasury Blumenthal told a Congressional hearing: "There are many causes of inflation. I wish there were

---

[229] From Blumenthal's testimony of January 29, 1979, in Committee on Ways and Means, U.S. House of Representatives (1979, p. 13). Also quoted in *Kansas City Star* (Missouri), January 29, 1979.
[230] From Blumenthal's testimony of January 29, 1979, in Committee on Ways and Means, U.S. House of Representatives (1979, p. 13).
[231] From Schultze's testimony of January 30, 1979, in Committee on Ways and Means, U.S. House of Representatives (1979, p. 88).

a single one. We would then be able to design a cure. [But] there are many complex causes... We, therefore, must devise multiple cures and approaches to deal with these multiple causes."[232]

But, after January 1979, the monetary view of inflation gained rapid and considerable ground in the United States. Vital impetus for this development actually came indirectly from the administration itself, through the historical revisions that it issued at the start of the year of estimates of potential output. As discussed in the first section of the present chapter, these revisions, in effect, lowered the contour of U.S. potential output over the 1970s. One, more mundane, effect of this changed picture was that it likely made policymakers more amenable to a tighter monetary policy. The much-narrowed historical and current output-gap estimates made U.S. economic overheating a far more likely prospect for 1979 than it had seemed previously—with even Blumenthal and Schultze, as discussed above, taking this view by March 1979 and being worried about an imminent overshooting of potential output by actual U.S. output.[233] Even among cost-push adherents like Blumenthal and Schultze, therefore, the role that demand restriction had to play as a necessary condition for generating disinflation was increased.

More profoundly, the changed official estimates helped instill what Romer and Romer (2002b, p. 33) called "the modern consensus" on the links between monetary policy, economic slack, and inflation. The 1979 estimates of potential output now offered much less support to the notion that the 1970s had been a period of simultaneous deep negative output gaps and high inflation, and they greatly buttressed the characterization Friedman and other monetarists had given of the decade being one of excess-demand driven inflation. The output-gap revisions, as they were digested, made the response of inflation to the output gap now more detectable than previously—largely rendering obsolete Schultze's observation in January that "inflation is so resistant to the traditional measures of [demand] restraint."[234] With the new perspective on the 1970s in hand, it was no longer true, as Arthur Okun would claim (in a posthumously published discussion) with

[232] Testimony of January 31, 1979, in Joint Economic Committee, U.S. Congress (1979, p. 4).
[233] Despite the disagreement between the administration and Miller in spring 1979 on the pace of tightening, with the administration favoring a more rapid imposition of monetary restriction, Miller was concerned to tighten monetary policy during 1979 in a manner that prevented output from surpassing the level of potential output. So was Volcker. For example, Volcker warned of an overheating danger in his September 5, 1979 testimony (Volcker, 1979d, p. 739): "A moderation in the growth of aggregate demand was welcome this year—even essential—if the economy was to avoid the kind of pressures on capacity that could only aggravate inflationary forces." As it happened, according to modern estimates, output *did* overshoot its potential level during the year and so likely produced the aggravation of inflation that Volcker regarded as a risk. Indeed, retrospective estimates would suggest that a positive output gap emerged in 1977−1978, and this continued into 1979. See Orphanides (2003, p. 655).
[234] From Schultze's testimony of January 30, 1979, in Committee on Ways and Means, U.S. House of Representatives (1979, p. 88).

regard to the late 1970s that "the monetarist model has not dealt successfully with the phenomenon of chronic inflation," that, in particular, monetarists had been refuted about the connection between slack and inflation, and that Friedman's position that an oil price shock had no lasting inflationary effect had been discredited.[235]

The importance of the output-gap revisions in changing views about the character of inflation is underlined by the fact that in December 1978, Alan Greenspan, a longtime holdout against cost-push interpretations of the 1970s inflation, seemed to be pivoting toward those interpretations. Greenspan remarked: "Our problem is one for which we have no firm theoretical understanding. For the last six or seven years, we have been endeavoring to establish a theoretical framework for a condition of chronic inflation in a period of less than full utilization of resources. It is not an explanation to say that there… is simply demand-pull. Our problem is not something we fully understand."[236] The revised output-gap estimates in 1979 and their widespread acceptance made such a pivot unnecessary, as inflation in the 1970s was now highly amenable to being understood using a short-run nonvertical, long-run vertical Phillips-curve equation in which cost-push shocks were only a source of temporary movements in inflation around its mean.

Such a view of inflation, furthermore, suggested that a policy of aggregate-demand management that allowed the output gap to become negative for a time was necessary to reduce inflation—and that no other policy was likely to do so. Perhaps reflecting the spread of this mindset, as early as February, Citibank's economic analysts were suggesting that the U.S. authorities *wanted* to push output below its potential level, in order to get inflation down (*Citibank Monthly Economic Letter*, February 1979, p. 2). Whether this was true as early as this point of the year, when Miller still headed the Federal Reserve, is open to question, in view of Miller's longstanding sympathy with cost-push accounts of the 1970s inflation. But even Miller seemed to be moderating his stand during 1979 on the matter of what nonmonetary weapons against inflation could do: in midyear, he remarked that the administration's wage-price standards were

---

[235] Okun (1981, pp. 1, 2, 3–4; quotation from p. 1).

[236] From Greenspan's remarks of December 5, 1978, in Daly and others (1979, p. 24). Greenspan's surrounding remarks indicated that Greenspan was not countenancing moving to a *pure* cost-push position, in which inflation was insensitive to slack. He was, however, now entertaining the possibility that cost-push shocks might be a source of prolonged, one-sided pressure on inflation for a given setting of monetary policy. Embrace of such a position would have moved him away from a monetary view of inflation to a "partial cost-push" view of inflation. The latter view was exemplified by Paul Samuelson's stance (given in 1969) that "we are not masters of our own house domestically" (that is, control of aggregate demand could not deliver price stability alongside full employment) because "we have wage-price spirals which are out of our control" (quoted in Hinshaw, 1971, p. 43). See also Romer and Romer (2004, p. 158), who provided an early discussion of this lapse in Greenspan's position and who stressed that his policy prescriptions did not change markedly in light of it.

only "a minor part of the anti-inflation program," in contrast to the "big guns of monetary and fiscal policy" (*St. Louis Globe-Democrat*, June 15, 1979). It was, however, under Paul Volcker that it became much more the case that the doctrine underlying Federal Reserve strategy was one in which the U.S. monetary authorities would accept Friedman's position that inflation was a monetary phenomenon and that, accordingly, monetary policy was the only effective device that could be used against inflation.

For Friedman, this development did not come a moment too soon. The need for effective monetary control was urgent, Friedman observed in October 1979, because "sooner or later, the adverse effect of inflation will destroy the country." (*San Francisco Chronicle*, October 18, 1979.)

A convergence of views

The articulation by Volcker of a monetary view of inflation was part of an overall sketch that he provided during the late 1970s on his views on aggregate economic relations. During his tenure as Federal Reserve Bank of New York president, Volcker had made a number of statements on monetary policy, inflation, and disinflation that acknowledged the validity of key positions that, at the time, were closely associated with the monetarist position and diverged from much of the Keynesian and administration economic thinking of the time (see, for example, Romer and Romer, 2004, p. 156, and Meltzer, 2009b, pp. 946, 1010).[237] The convergence of his views with those of Milton Friedman, in particular, continued to be evident in statements that Volcker made on matters of economic substance in his early period as Federal Reserve chairman.

On money and aggregate demand, Volcker testified on October 15, 1979: "M1, M2… I think those are the variables that are important for economic activity."[238]

With regard to money and inflation, Volcker remarked at the same Congressional hearing that "in very simple terms, of course, what the Federal Reserve does is control or influence the supply of money and credit," that the decision had been made to respond to "the situation by moderating the growth of money and credit rather than simply following a passive course of creating more

[238] In Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1979a, p. 8).

money," and that this would "begin to lay the foundation for a sustained effort on the inflation front."[239] This perspective was one Volcker reaffirmed repeatedly during his first term as chairman. For example, two years into this term, Volcker told a Congressional questioner: "I certainly agree that there is a broad relationship between growth in the money supply and inflation. That is the basis of our policy…"[240]

With regard to the inflation-unemployment relationship, Volcker had in the 1960s been a subscriber to a long-run Phillips-curve tradeoff (see Nelson, 2020b, Chapter 13). His thinking on this matter had changed greatly by the time he became chair in 1979. This was brought out in his public statements, including a speech a few days after his October 6 announcement. Here, partly echoing the 1977 speech in which he credited monetarists on the matter, Volcker observed: "After years of inflation, the long run has caught up with us. We can no longer blithely assume we can buy prosperity with a little more inflation."[241] In the same passage, he indicated that "so-called tradeoffs between inflation and employment" had disappeared once expectations of inflation adjusted to new conditions. And, a few days later, Volcker indicated that it was price stability that would "improve the prospects of economic performance in the longer run."[242]

On interest rates, Chairman Volcker continued to press a point that he had made as a reserve bank president—and that Friedman had made repeatedly for decades. During his presidency, Volcker (1978b, p. 332) had stated that monetary expansion might ultimately mean "not lower, but *higher*, rates" of interest. He reaffirmed in October 1979 testimony that efforts to achieve stabilization or reduction in nominal interest rates via more rapid monetary growth would ultimately be a "futile effort"—capable of being effective only in the short run.[243] Applying his views on the shorter-run and longer-run influences of monetary policy on interest rates to a context of disinflation, he observed in his October 1979 conference speech: "When the money supply is brought clearly under control and expectations of inflation dissipate, interest rates will tend to decline."[244] Volcker, both as Vice Chairman of the FOMC in 1975−1979 and as

Chairman from 1979 onward, particularly stressed the importance of inflation expectations as an influence on longer-term interest rates.[245]

On exchange-rate management versus floating rates, Volcker had a background of being in the Nixon Administration in a period, 1971 to 1974 that, in Friedman's evaluation, was one of a generally excellent record in the area of international economic policy. However, as indicated in Chapter 4 above, Friedman largely credited George Shultz with arguing the case for floating rates against skeptics who, he believed, included Volcker. Friedman would, nonetheless, have reason to be pleased with Volcker's answer at a press conference in October 1979: "In some sense, the less intervention, the better; if you don't need to intervene, so be it."[246] In a broader sense, of course, the Volcker response to a situation in fall 1979 in which U.S. exchange-rate weakness figured prominently was to focus on domestic monetary policy and continued free floating. This was much closer to Friedman's preferred approach than the intervention-centered Carter Administration/Federal Reserve response to dollar weakness in the fall of 1978.

With regard to the positions on economics that Volcker took during the 1970s, one of the more nuanced cases—closely linked, of course, to the contest discussed above between cost-push and monetary views of inflation—was the matter of incomes policy. Over the decade from February 1971 through January 1981. Volcker was in national office during roughly half of the time. In the course of most of those years of service, the incumbent administration (Nixon, and later Carter) had an official policy either of mandatory controls (Nixon, starting in August 1971) or an informal, and increasingly codified, wage-oriented incomes policy (under Carter). Against this background, Volcker's ability to speak out against incomes policy, without appearing to undercut national economic policy, was circumscribed. His likely underlying feelings had, however, been allowed to surface publicly when, about seven months before the Nixon Administration moved to controls, Volcker criticized other country's incomes policy experiences (*Morning News* (Wilmington, Delaware), January 15, 1971).

In his time as a reserve-bank president, Volcker exhibited some sympathy with cost-push views

[245] Public statements that Volcker made as Vice Chairman in this connection included Volcker (1976c, p. 155) and his testimony of July 30, 1979, in Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1979b, p. 5). There were, in fact, many occasions in the 1970s and 1980s when Volcker publicly stressed the influence of inflation expectations on longer-term interest rates (see also Nelson, 2021). Contrary to the implication of Goodfriend and King (2005, p. 981), his belief in this influence was not a new piece of information disclosed for the first time publicly by the release, in 2004, of the 1979 and 1980 FOMC meeting transcripts.
[246] Volcker (1979c, p. 7).

of inflation, as indicated in the previous chapter. But as outlined above, revisions of estimates of potential output in early 1979 gave renewed credibility to demand-based accounts of the 1970s inflation.[247] And in his confirmation hearings that July, Volcker discouraged the practice of "decomposing the price indices all the time, and saying inflation is just due to this factor or that factor."[248]

In 1979 and 1980, Volcker was publicly supportive of the Carter Administration's incomes policy efforts. And he was, and remained, one of many who saw factors in the wage-setting mechanism, such as backward-looking indexation arrangements, as likely to prolong inflation and make more difficult the disinflation process.[249] Nevertheless, Volcker also took positions on the wage-price relationship that were notably close to those Friedman had articulated: monetary policy could bring down inflation even if nominal wage growth was not initially brought down; and, relatedly, nominal wages, being largely set in advance, tended to be based on expectations of past price conditions and tended to lag developments in prices.[250]

After the Carter Administration was out of office, Volcker could be less uninhibited in his criticism of nonmonetary approaches to inflation control. In a hearing held on July 16, 1981, after a member of Congress had suggested to him that an incomes policy would be appropriate, Volcker responded, "I think the problem is that those approaches have been tried and have been particularly unsuccessful, to put it mildly… I do not see the usefulness of that approach."[251]

Friedman's views on trial

Volcker had written to Friedman in August 1979 that, although he expected Friedman to continue to be critical of U.S. monetary policy, he welcomed his future commentary: "you know

---

[247] See also Romer and Romer (2004, p. 157) on the "much more realistic views" Volcker articulated in 1979.
[248] From Volcker's testimony of July 30, 1979, in Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1979b, pp. 38–39).
[249] On this point, see Volcker's testimony of October 15, 1979, in Committee on Banking, Housing, and Urban Affairs, U.S. Senate (1979a, p. 20). In common with many, Volcker believed that indexation would likely exacerbate the real costs of disinflation, by being linked to inherited rates of inflation, as opposed to the kind of indexation schemes Friedman envisioned when he advocated indexation.
[250] See Volcker (1979b, p. 10; p. 42 of printed version). On Friedman's exposition of these points, see Chapter 3 above as well as Nelson (2020a, Chapter 8; 2020b, Chapter 13). In contrast, in a written submission to Congress for his testimony of January 29, 1979, Secretary of the Treasury Blumenthal had stated: "To bring down price inflation, we must bring down wage inflation…" (In Committee on Ways and Means, U.S. House of Representatives, 1979, p. 16.)
[251] See also Meltzer (2009b, pp. 1058, 1097) for documentation of other occasions on which Volcker criticized incomes policy and wage-push theories of inflation.

I will not be unhappy to have you preaching the doctrines of monetary rectitude as we move ahead" (in Silber, 2012, p. 149). In the event, Friedman became much more negative in the 1980s about Volcker's record than Volcker likely could have expected. Even so, Volcker's feeling about Friedman's commentaries in retrospect had elements of his initial positive attitude: "he was a pain, frankly, because he wouldn't—he'd never want to give the Federal Reserve credit for anything, anytime," but, in the course of these public remarks, Friedman did stress the importance of monetary restraint. "So, in a sense, obviously, Friedman was helpful in that." (Paul Volcker, interview, October 16, 2013.)

Notwithstanding his status as an outside critic, Friedman found that he had a heavy stake in the course of the 1979 policy experiment. The *Financial Times* immediately judged that the October 1979 change amounted "to a considerable revolution in U.S. monetary policy" (*Financial Times* (London), October 8, 1979*c*). In the revolution in tactics and strategy that it adopted in 1979, the Federal Reserve was perceived, and with good reason, as adopting a template largely laid out by Friedman.

As Volcker put it, "you know, we adopted what could be termed certainly a Friedmanite policy—emphasized the money supply, and all the rest. Partly because Friedman had made that such a bellwether that we kind of capitalized on that, psychologically. Because it was a way to explain the importance of getting after inflation and the fact that, you know, you had to deal with [the] money equation." (Paul Volcker, interview, October 16, 2013.)

The 1979 shift thus confirmed Friedman's success in getting his views accepted and vindicated the statement in the Hoover Institution's annual report in 1978 that Friedman "is the nation's leading monetary economist."[252] But it also meant that Friedman would be criticized if the change was not perceived as a success. The headline—"Testing Monetarism Theory"—of a syndicated newspaper article (*South China Morning Post* (Hong Kong), October 14, 1979) that appeared shortly after the October 1979 measures were announced made it clear that the monetarists, not just the Federal Reserve, would be judged on the basis of how the new regime turned out.

Volcker's move did not exactly have enthusiastic public support, but it had a certain amount of general acceptance. "Not so long ago the current level of interest rates would have been regarded as unthinkable," one newspaper editorialized. "The fact that the public is not storming

---

[252] Hoover Institution (1978, p. 12).

the temples of economic power is evidence that the nation is ready for economic discipline to slow a rising cost of living…" (*Kansas City Times* (Missouri), October 12, 1979*b*.)

Friedman also stressed in mid-1979 his belief that, by now, there was considerable professional support for his position on how to deal with inflation: "many leading economists do stress these fundamentals."[253] Even among U.S. economists, however, there remained notable opposition to the monetary view of inflation and to Volcker's application of it. For example, James Tobin reacted to the October 1979 announcement by suggesting that the reduction in inflation that could be expected from years of monetary restraint would be small (*New York Times*, November 11, 1979).[254] Another U.S. academic (albeit one who, by 1979, was outside the mainstream of economics) who took to the public press to challenge the monetarist approach was Leonard Rapping. A one-time supporter in his research of Friedman's views on inflation, Rapping had changed his tune: "Regrettably, our central bank has only the equivalent of nuclear weapons in its arsenal for controlling inflation. Inflation cannot be responsibly controlled through either monetary or fiscal demand management." (*New York Times*, October 28, 1979.) A major test of whether monetary tightening would resolve the United States' inflation problem was clearly in store for the country in the 1980s.

JERRY BROWN

In introducing Volcker at a Congressional hearing in October 1979, Senator William Proxmire contended that "we must recognize that the Federal Reserve alone cannot eliminate inflation… Fiscal policy must also continue to be restrictive at least until inflation is brought under control, and that means that the Congress must spend less and reduce the deficit."[255]

Friedman believed that the Federal Reserve could eliminate inflation on its own. He did not accept the close linkage that Proxmire's remarks implied of the case for fiscal tightness with the

---

[253] From his remarks (given in a letter) in Friedman and Goldberger (1979, p. 36).
[254] Paul Samuelson, although not exactly contradicting Tobin's position, had foreshadowed accurately early in Volcker's tenure what likely might ensue from a "Federal Reserve-Carter policy of austerity." Samuelson contrasted the situation in the United Kingdom facing the newly-elected government of Margaret Thatcher, who had time to have a costly recession and still go to the polls in conditions of lower inflation and economic recovery, with the situation in the United States, for which "the benefits of a U.S. recession that reduces two-digit inflation to high one-digit rates would be more likely to come *after* a one-term president [Carter] is writing his memoirs in Georgia" (*Newsweek*, September 24, 1979). The main element of error in Samuelson's prediction was that U.S. inflation had, by mid-1982, fallen much more than he had implied was likely.
[255] From Proxmire's remarks of October 15, 1979, in Committee on Banking, Housing, and Urban Affairs (1979a, p. 2).

need to address the country's inflation problem. Nevertheless, Friedman agreed with the basic fiscal policy prescription of federal spending restraint that Proxmire propounded. As discussed in Chapters 5 and 9 above, Friedman saw merit in federal spending restriction both as a short-run measure—on the grounds that it would, in the event of a restriction of aggregate demand, tend to place more of the burden of adjustment on the public sector—and as a long-run measure—something that could improve U.S. productivity performance by reallocating resources to the private sector. It was primarily with this long-run motivation in mind that Friedman pressed ahead, over the course of 1979, with his push for a constitutional amendment restricting the U.S. federal budget.

On January 30, 1979, Friedman appeared at a press conference in Washington, D.C., to launch the National Tax Limitation Committee's draft constitutional amendment on balancing the budget. The draft amendment, fit onto a single page of the committee's press release (see Committee on the Judiciary, U.S. House of Representatives, 1980, p. 125) was the work of the committee's drafting panel, on which Friedman had served during the previous few months.[256]

The *Washington Post* report (January 31, 1979) on the press conference noted an oddity: although advanced by a tax-limitation committee, the "proposed amendment would not limit taxes." A second oddity was one Friedman reveled in: although widely reported and promoted as a balanced-budget amendment, it was, in fact, a spending-limitation amendment—one requiring, except for cases of emergencies, the planned growth in nominal federal spending to be subject to an upper limit equal to the recent growth in nominal national income. Indeed, its formal name was the Federal Spending Limit Amendment proposal.[257] Furthermore, when nominal income growth had embedded in it a rate of inflation above three percent, the limit on federal spending was specified as being at a lower ceiling still—a reflection of Friedman's belief, already noted, that federal spending restriction should bear a disproportionate amount of the overall restriction of aggregate demand during a process of disinflation.[258]

At the press conference, Friedman argued that the proposed amendment was "a thoughtful, reasonable alternative" to rival proposed amendments which would actually directly require a

---

[256] The draft amendment was also reproduced in Friedman and Friedman (1980, pp. 313–314).
[257] See, for example, the prepared statement of William Craig Stubblebine for the hearing of November 1, 1979, in Committee on the Judiciary, U.S. House of Representatives (1980, pp. 362–363).
[258] As Friedman had foreshadowed during the drafting process (see Nelson, 2020a, Chapter 3), the proposed amendment provided for the suspension of the amendment's budgetary restrictions in the event of war (see the text of the amendment in the reference cited above, as well as the discussion in *Newsweek*, February 12, 1979).

balanced budget. He suggested that "a simple budget-balancing amendment… turns out to be impossible to implement," and that the amendment he was advancing would "let the budget balance itself" over time while also achieving a 5-percentage-point reduction in the share of federal outlays in national income, with the aim of bringing it down to about 20 percent by the end of the 1980s (*Washington Post*, January 31, 1979).

The press conference received national publicity, and Friedman's association with the proposal led syndicated newspaper columnist to call it the Friedman amendment (*New York Times*, February 5, 1979). By the time of the press conference, however, this proposal had been overshadowed by the fact that Jerry Brown, who in 1975 had succeeded Ronald Reagan as governor of California, had interposed himself into the debate on constitutional budgetary limitation. In his second-term inauguration speech on January 8, 1979, Brown had himself called for a balanced-budget amendment (*The Courier-Journal* (Louisville, Kentucky), January 10, 1979).

Lewis Uhler of the National Tax Limitation Committee had professed to be delighted with Brown's intervention: "Brown has done great things for us. He has made us the moderates on this issue." (*Los Angeles Times*, February 18, 1979, Part I, p. 25.) One political commentator observed, however, that although "Brown's amazing ability to command media attention" had been good for drawing attention to the amendment movement, and that Brown had established himself as the "most vociferous champion" of a constitutional requirement for a balanced budget, his emergence as a key advocate of federal budget limitation might ultimately have a negative effect on the cause, in light of his reputation for flip-flops on economic policy and the suspicion that he was seizing on the issue to boost his planned campaign against Jimmy Carter for the 1980 Democratic presidential nomination (*Daily News* (New York), February 28, 1979).

Friedman's perspective on Brown's entry to the debate was very much along the same lines as this commentary. After Brown came out in favor of an amendment, Friedman did claim that he was "delighted" by the fact that governors in the United States were keeping up the momentum for a federal constitutional amendment (*Los Angeles Times*, February 18, 1979, Part I, p. 25). But the fact was that Friedman was not happy at the prospect of Brown being the national face of budget limitation. This was despite some pleasant impressions Friedman had had of Brown, particularly during the latter's first three years in office. Friedman had noted with approval that Brown had continued to some extent the small-government attitude that had characterized Reagan's tenure as governor (*Newsweek*, March 1, 1976). Along these lines, in August 1975

Brown had remarked in a television interview: "I don't think government ought to be the answer to everything. If it is, we're not going to have a free country anymore."[259] About eighteen months later, in a meeting that in effect marked Friedman's move to the West Coast, Brown and Friedman had a five-hour discussion in the village of Bodega Bay, north of San Francisco, and found much agreement on issues related to limiting the role of the public sector in the economy (*The York Dispatch* (Pennsylvania), February 11, 1977). After this meeting, Friedman indicated that he saw some ability in Brown, crediting him with being "a maverick, more or less made in his own image" and willing to break with his own party on certain issues. On the whole, however, Friedman saw little cohesion in Brown's approach to economic policy (*Reason* magazine, August 1977, p. 29).

Brown and Friedman were subsequently, however, on opposite sides in the Proposition 13 debate in 1978. Even though Brown made efforts after the referendum result to build bridges with some of Proposition 13's proponents, Friedman remained unpersuaded of Brown's credentials on economic matters.

In March 1979, Friedman addressed Brown's support of a balanced-budget amendment directly in a *Newsweek* column bearing the blunt title (all in capital letters—reflecting the magazine's brief employment of that format for its article headings): "JERRY BROWN'S KISS OF DEATH."[260] The title was the most negative thing said about the governor in the column: Jerry Brown was not Friedman's least favorite politician by any means. But the column did lament the likelihood that Brown's prominent support for a budget-balancing amendment would make it a "football of partisan politics," instead of, as Friedman would prefer, one associated with both sides of the U.S. Congress—the body in which Friedman hoped progress toward an amendment would be centered. He also noted that Brown was perceived as using the issue as a "launching pad" for a 1980 primary challenge to Carter and that this would discourage those Democrats who wanted the president to have a second term from endorsing an amendment (*Newsweek*, March 26, 1979).[261]

---

[259] This interview was excerpted in *Call to Convention: Governor Brown and the Tax Revolt*, PBS, April 19, 1979.
[260] This was Friedman's second successive column on the matter. He had devoted his March 5 column to the National Tax Limitation Committee proposed spending amendment that he had co-drafted and, in particular, to its potential macroeconomic benefits.
[261] A few weeks after his column appeared, Friedman also discussed Brown's activity in the area when interviewed for a television news special, made by San Francisco's local PBS channel WQED and widely shown nationally, titled *Call to Convention: Governor Brown and the Tax Revolt* (see *San Antonio Light* (Texas), April 15, 1979, and *https://americanarchive.org/catalog/cpb-aacip_55-v40js9hr9n*).

Friedman then went back to his running theme of the primacy of restraining spending rather than some other index of the budget. He had already remarked on television that "Howard Jarvis' activities since [Proposition 13] have been a mixed blessing" because they diverted attention toward tax limitation rather than spending limitation" (*Meet the Press*, NBC, November 12, 1978, p. 1 of transcript). On a related tack, Friedman's *Newsweek* piece proceeded to take Brown to task for emphasizing budgetary balance as a virtue in itself, when, as Friedman saw it, one should "seek a balanced budget not for its own sake but in order to halt inflation and reverse the steady increase in the fraction of our income being spent by Washington on our behalf" (*Newsweek*, March 26, 1979).

Brown was not the only politician failing to grasp this point, Friedman believed. The same was true of many national legislators. At the January press conference, Friedman had optimistically suggested that it was "enormously likely" that Congress would act in the area of constitutional limitation on the budget because "they're under the gun, they're aware of the vast public sentiment for something like this" (*New York Times*, January 31, 1979). In a sense, this expectation was borne out: over a dozen proposed amendments had been introduced in the Senate alone by May 1979 (*Congressional Digest*, May 1979, p. 136). The National Tax Limitation Committee had actually hired two Washington-based lobbyists to advance its own proposed draft of the amendment. But the variety of alternative schemes only underlined a key concern of Friedman's—that "the right kind of constitutional amendment," that is, one like his that sought to hold down spending, be the one adopted (*Los Angeles Times*, February 18, 1979, Part I, p. 25). He opposed the notion that "it's OK to balance the budget by increasing taxes" (*Call to Convention: Governor Brown and the Tax Revolt*, PBS, April 19, 1979).

In any event, regardless of the specific variant being contemplated, any proposed constitutional amendment pertaining to the federal budget faced enormous odds against being adopted. Friedman's column on Brown's entry into the debate was, nevertheless, bullish both with regard to a federal limitation on the budget being added to the constitution and to the form of the amendment being along the lines that Friedman favored. In this connection, Friedman was receptive to Brown's proposed route of calling a constitutional convention to consider alternative proposed amendments.[262] But even if such a gathering did not go ahead, Friedman suggested, the

[262] In addition to expressing this sentiment in his *Newsweek* column of March 26, 1979, Friedman remarked in an interview for public television that was taped at his Hoover Institution office: "I don't have any objection to the convening of a constitutional convention. I believe that the fears that have been expressed about it are grossly exaggerated. All a constitutional convention can do is propose—nothing is adopted [into the constitution] unless it's passed by three-quarters of the states. You're not going to get crazy amendments proposed. If you did, you're not

option of holding it—what Friedman, in a rare embrace of terminology associated with game theory, called "the credible threat of a constitutional convention"—could expedite Congressional action on an amendment (*Newsweek*, March 26, 1979).[263]

Testifying to Congress

Friedman's emphasis on federal spending as the key variable, and not the numerical difference between expenditures and tax revenue, permeated testimony he gave to the House of Representatives' Committee on the Judiciary on May 17, 1979. This was Friedman's first appearance at a Congressional hearing since his move to California in 1977. It would also prove to be his last-ever in-person delivery of testimony to Congress. Friedman's opening statement repeated a point he had made for years on public spending control: "We need to cure the defect in our political structure, to have an effective way in which the public can express its judgment on the part of its income that it wants the government to spend on its behalf." An amendment, together with the public consensus that would underlie its passage, was, Friedman suggested, "by far the best way to achieve this objective."[264]

A poignant exchange in the question-and-answer part of Friedman's testimony brought out poignantly how some of his longtime views on fiscal policy still survived in his thinking in 1979. His remarks were a response to a question that cited the "absolutely overwhelming case" that Charles Schultze had articulated in his testimony at an earlier proceeding of the hearings against raising taxes or reducing federal spending in an effort to balance the budget when a recession occurred.[265]

Although Friedman, elsewhere in his testimony, made it clear that he did not think that fiscal policy was the powerful influence on aggregate demand that Schultze believed it to be, his answer to this particular question was conciliatory. "The answer to that is that I am not in favor

---

going to get them adopted." Friedman also conjectured, as he had in *Newsweek* column, that his own preferred form of budget limitation would be what a convention would favor. He stated in the interview: "I would predict that, if a constitutional convention were convened to consider a balanced budget amendment, in the course of those deliberations it would tend to switch toward limiting government spending, either in addition to, or instead of, mandating a balanced budget." (*Call to Convention: Governor Brown and the Tax Revolt*, PBS, April 19, 1979.)

[263] Brown himself had said of the prospect of a convention: "so this is a good prod to get Congress to move" (*Call to Convention: Governor Brown and the Tax Revolt*, PBS, April 19, 1979).

[264] From Friedman's testimony of May 17, 1979, in Committee on the Judiciary, U.S. House of Representatives (1980, p. 123).

[265] From the question of Representative John F. Seiberling in the session of May 17, 1979, in Committee on the Judiciary, U.S. House of Representatives (1980, p. 134). Schultze had testified to the committee on March 28.

of a balanced budget amendment. The amendment I am defending is not a balanced budget amendment. It is a spending-limit amendment, and it has none of the defects that Mr. Schultze was pointing to about the balanced budget amendment. On the contrary, this [the National Tax Limitation Committee] amendment has built into it an automatic anticyclical component."[266]

Friedman's reference to the "automatic anticyclical component"—the operation of fiscal policy's automatic stabilizers—brought out why the drafting group for the amendment was able to get agreement on it not only from members of the group—like Milton Friedman, Rose Friedman, and James Buchanan—who tended not to put great weight on fiscal policy as a stabilization-policy tool—but also among those members—like Robert Gordon and Paul McCracken—who were much more sympathetic to Keynesian views on the power of fiscal policy.[267] But it was also the case that, even in his monetarist years, Friedman was not averse to the operation of automatic stabilizers and to the notion that they might help, on the margin, in easing business-cycle fluctuations.[268] Indeed, even in his March 26 column on Brown (which Friedman included as an enclosure in the written portion of his May Congressional testimony), he had cited the merits of aiming for a balanced full-employment budget, only to indicate that there were problems making that a concrete policy prescription. This practical concern was certainly justified by the very recent, and substantial, official revisions of U.S. potential output.

After the spotlight that Jerry Brown's activities early in the year and the Congressional hearings in May had put on the issue of constitutional restriction on the federal budget, the topic faded as a matter of national attention, especially as the concerns related to energy prices and gasoline lines came to the fore during the summer of 1979. On September 21, during his time in the city of Chicago to record the *Free To Choose* studio debates, Friedman attempted to breathe life back into public discussion of a spending-limitation amendment by holding, with Lewis Uhler, a press conference.

This event, held at the city's Marriott hotel, was essentially a relaunch of the campaign for the National Tax Limitation Committee draft amendment they had issued the previous January. At

---

[266] From Friedman's testimony of May 17, 1979, in Committee on the Judiciary, U.S. House of Representatives (1980, p. 134).
[267] See Committee on the Judiciary, U.S. House of Representatives (1980, p. 126) for the list of members of the drafting committee.
[268] Samuelson's (1973a, p. 848) listing of "Anticyclical fiscal and monetary policies" as among the things that Friedman was against did not, therefore, provide an altogether accurate characterization of Friedman's views on the dimension of fiscal policy.

the Chicago event, Friedman suggested: "The growth of the budget now is determined by each special interest group seeking a program. This amendment would make one special interest group a check on another—instead of all of them ganging up on the taxpayer." (*Chicago Sun-Times*, September 19, 1979.)

By this point, not only had national interest in formal budget limitation dwindled, but so also had public interest in Jerry Brown's likely presidential campaign, which Brown had still not yet formally launched. Brown had been unable to displace Edward Kennedy in the public mind as the likely principal Democratic challenger to President Carter. Indeed, Paul Samuelson had predicted, during Carter's summer troubles, that the president might cede the Democratic nomination to Kennedy by simply deciding not to seek reelection (*Financial Times* (London), August 6, 1979). In the fall of 1979, by which time it was clear that Carter was not withdrawing, Samuelson used his *Newsweek* column to give Kennedy tips for a successful candidacy against the president (*Newsweek*, October 15, 1979). And when Friedman a little earlier mentioned in his own column that Carter was "fighting on two fronts for reelection" (*Newsweek*, October 1, 1979), he was likely referring (on the Democratic side of these fronts) predominantly to Kennedy, rather than Brown, as the president's challenger. Brown went ahead with his campaign but, in the event, continued to fail to gain traction. The perception of the Democratic contest as really being one solely between Carter and Kennedy was a constant during the 1980 primary season and was already firmly fixed even by fall 1979.

Looking ahead to 1980

Brown therefore went unmentioned when, near the end of his extended spell in the city of Chicago, Friedman appeared with Phil Donahue again, for an interview on the *Today* show (NBC, September 28, 1979), and was asked his views about several of the individuals likely to seek the presidential nomination in 1980. "I assume would not support the candidacy of Edward Kennedy," Donahue said to Friedman. "I would not," Friedman confirmed. Nor, Friedman added, would he support the president's reelection: "Jimmy Carter I would find it impossible to support. I think he's been a disaster."

Turning to Republican candidates, Donahue asked about John Connally—the Secretary of the Treasury whose tenure had seen the introduction of price controls. Friedman had had warm words to make about Connally when he had left his Treasury position in mid-1972. On that occasion, Friedman had stressed the fact that Connally had, on net, presided over a liberalization

of international monetary arrangements (Instructional Dynamics Economics Cassette Tape 100, May 31, 1972). But Connally had blotted his copybook with Friedman anew when, as presidential adviser, he had played a key role in recommending to President Nixon the new price freeze of 1973 Instructional Dynamics Economics Cassette Tape 122, June 6, 1973). And, even in the international area, Friedman could not overlook the fact that, after the initial August 1971 move toward exchange-rate flexibility, Connally had made, via the Smithsonian agreement, "an attempt to reestablish the system of fixed exchange rates" (Instructional Dynamics Economics Cassette Tape 146, May 20, 1974). "I would not support John Connally," was Friedman's simple answer to Donahue in 1979.[269]

The next name that Donahue offered was Ronald Reagan. "Yes, I would support Ronald Reagan," Friedman confirmed. Donahue asked, "Have you told him?" "Well, I'm not sure whether that's a subject matter for public discussion," Friedman replied. This was, of course, a *de facto* affirmative answer. Indeed, Michael Parkin, who visited the Hoover Institution for the 1979/1980 academic year, got the impression on the basis of his frequent lunches with Friedman during that year that "Milton's goal in life was to get Reagan nominated" (Michael Parkin, interview, May 29, 2013).

Reagan would officially launch his candidacy for the nomination on November 13, 1979.[270] The team that would supply Reagan with memoranda on economic matters during the Republican presidential primary campaign and later national election campaign had, in its membership, not only Friedman and Martin Anderson but also individuals, such as Arthur Burns and Alan Greenspan, who, in contrast to Friedman and Anderson, would probably have favored Gerald Ford over Reagan as a 1980 candidate, had Ford decided to be a formal contender for the Republican party nomination. "Those of us who were in the Ford Administration and considered Ford a wonderful person deserving of support stayed with him [in 1976]," Alan Greenspan recalled. "But none of us considered Reagan an enemy. He was an opponent during the 1976 primary campaign, but not an adversary. And almost all of us, when Ford left office, joined the Reagan camp." (Alan Greenspan, interview, August 19, 2013.)

Friedman's endorsement on national television of a Reagan candidacy was followed a few

---

[269] Friedman had also described (in so doing, exhibiting his too-ready tendency to make analogies in domestic political and social debate with Nazism or totalitarianism) Connally's idea of compulsory government service for 18-year-olds as "a Hitler-type youth program" (*Manchester Union Leader* (New Hampshire), February 16, 1979).
[270] See, for example, Merz (1980) and Cannon (2003, p. 544). (In Friedman and Friedman, 1998, p. 389, Milton Friedman erroneously suggested that the Reagan campaign only formally commenced in 1980.)

months later by Reagan's public endorsement of Friedman's major new multi-media project. With the *Free To Choose* television series due to start broadcasting early in the New Year, the Friedmans' companion book to the series started to appear in U.S. bookstores in late 1980. This $9.99 hardcover book had a dust jacket whose inside front text began with Reagan's words: "A superb book. The Friedmans eloquently diagnose the problems facing America and make imaginative proposals for change. It is 'must reading' for everyone—from the president to the private citizen—who is concerned with the future of America." When Reagan wrote the endorsement, "the president" to whom he was referring as needing to read *Free To Choose* was Jimmy Carter. But by January 1981, when the book, which had been a bestseller in 1980, became available as a mass-market paperback, Carter was in his last days in office, and Reagan himself was president-elect.

Bibliography

This bibliography consists of two parts: a chronological listing of the media items (pieces in sound, television, newspaper, and magazine sources) that have been cited in this study, and a reference list, in alphabetical order, consisting of the research papers and books that have been cited.

I. Newspaper articles and other media items cited (chronological listing)
